Technology Licenses

The hardware and/or software described in this document are furnished under a license and may be used or copied only in accordance with the terms of such license.

U.S. Government Rights

The Software is “commercial computer software,” as defined by Federal Acquisition Regulation (“FAR”) 2.101. Pursuant to FAR 12.212 and 27.405-3 and Department of Defense FAR Supplement (“DFARS”) 227.7202, the US government acquires commercial computer software under the same terms by which the software is customarily provided to the public. Accordingly, Keysight provides the Software to US government customers under its standard commercial license, which is embodied in its End User License Agreement (EULA), a copy of which can be found at http://www.keysight.com/find/sweula. The license set forth in the EULA represents the exclusive authority by which the US government may use, modify, distribute, or disclose the Software. The EULA and the license set forth therein, does not require or permit, among other things, that Keysight: (1) Furnish technical information related to commercial computer software or commercial computer software documentation that is not customarily provided to the public; or (2) Relinquish to, or otherwise provide, the government rights in excess of these rights customarily provided to the public to use, modify, reproduce, release, perform, display, or disclose commercial computer software or commercial computer software documentation. No additional government requirements beyond those set forth in the EULA shall apply, except to the extent that those terms, rights, or licenses are explicitly required from all providers of commercial computer software pursuant to the FAR and the DFARS and are set forth specifically in writing elsewhere in the EULA. Keysight shall be under no obligation to update, revise or otherwise modify the Software. With respect to any technical data as defined by FAR 2.101, pursuant to FAR 12.211 and 27.404.2 and DFARS 227.7102, the US government acquires no greater than Limited Rights as defined in FAR 27.401 or DFAR 227.7103-5 (c), as applicable in any technical data.

Warranty

THE MATERIAL CONTAINED IN THIS DOCUMENT IS PROVIDED “AS IS,” AND IS SUBJECT TO BEING CHANGED, WITHOUT NOTICE, IN FUTURE EDITIONS. FURTHER, TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, KEYSIGHT DISCLAIMS ALL WARRANTIES, EITHER EXPRESS OR IMPLIED, WITH REGARD TO THIS MANUAL AND ANY INFORMATION CONTAINED HEREIN, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. KEYSIGHT SHALL NOT BE LIABLE FOR ERRORS OR FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES IN CONNECTION WITH THE FURNISHING, USE, OR PERFORMANCE OF THIS DOCUMENT OR OF ANY INFORMATION CONTAINED HEREIN. SHOULD KEYSIGHT AND THE USER HAVE A SEPARATE WRITTEN AGREEMENT WITH WARRANTY TERMS COVERING THE MATERIAL IN THIS DOCUMENT THAT CONFLICT WITH THESE TERMS, THE WARRANTY TERMS IN THE SEPARATE AGREEMENT SHALL CONTROL.

Safety Information

CAUTION

A CAUTION notice denotes a hazard. It calls attention to an operating procedure, practice, or the like that, if not correctly performed or adhered to, could result in damage to the product or loss of important data. Do not proceed beyond a CAUTION notice until the indicated conditions are fully understood and met.

WARNING

A WARNING notice denotes a hazard. It calls attention to an operating procedure, practice, or the like that, if not correctly performed or adhered to, could result in personal injury or death. Do not proceed beyond a WARNING notice until the indicated conditions are fully understood and met.

1 Documentation Roadmap

This section describes the Keysight products covered by this document, and provides links to related documentation.

- "Products Covered by this Document" on page 100
- "Additional Documentation" on page 101

1.1 Products Covered by this Document

For the full list of instrument models covered by this documentation, see the title page: "LTE & LTE-A TDD ModeUser's & Programmer's Reference" on page 1.

1.2 Additional Documentation

If your instrument or computer has an internet connection, then you can access the latest editions of all relevant X-Series documentation via the links below.

This document is available in 3 formats:

- **Embedded Help**, in the instrument
- **Online Help**, at Keysight's web site

  For information on this Mode, browse to:

  http://rfmw.em.keysight.com/wireless/helpfiles/LTEATDDMode/FlexUI.htm
- **Users & Programmers Reference**, in downloadable PDF format

  For information on this Mode, download from:

  http://literature.cdn.keysight.com/litweb/pdf/N9082-90006.pdf

The following documents are available online at keysight.com:

X-Series Messages Guide

2 User Interface

Here are the basic elements of the Multitouch User Interface. For more information, tap a topic.

Included in this section are also topics for several front panel keys not described in other topics. Tap one of these topics for more information.

"Cancel key" on page 149

"Onscreen Keyboard key" on page 150

"Touch On/Off Key" on page 151

"Tab key" on page 152

2.1 Screen Tabs

In the X-Series Multitouch User Interface (or Multitouch UI), you can run many different Measurement Applications, or “Modes”. Examples are Spectrum Analyzer Mode, LTE-A FDD Mode, IQ Analyzer Mode, and Real Time Spectrum Analyzer Mode. Each Mode has its own set of controls, windows and SCPI commands.

Each Mode runs within a “Screen”. The Multitouch UI supports multiple “Screens” (see "Multiscreen" on page 193 for more information). Each screen displays one Measurement in one Mode. The set of configured screens is shown across the top of the display as a set of Screen Tabs, with a + tab at the right for adding new Screens:

You can see up to six tabs at a time on the UXA, and 4 at a time on the CXA, EXA, MXA and PXA. If there are more Screens configured than this, arrows appear to the left and right of the Screen Tabs; pressing the arrows scrolls the Screen Tabs to the left or right. A scroll bar also appears at the bottom of the Screen Tabs, indicating that you can scroll the tabs by dragging them with your finger; you can also scroll them by dragging the scroll bar.

Pressing a Screen Tab selects that screen for operation. Pressing the blue (selected) Screen Tab is the same as pressing the Mode/Meas front panel key.

Both actions open the "Mode/Meas/View Dialog" on page 105. In addition, if you have a PC keyboard plugged in, the sequence CTL-SHIFT-M will open up this dialog.

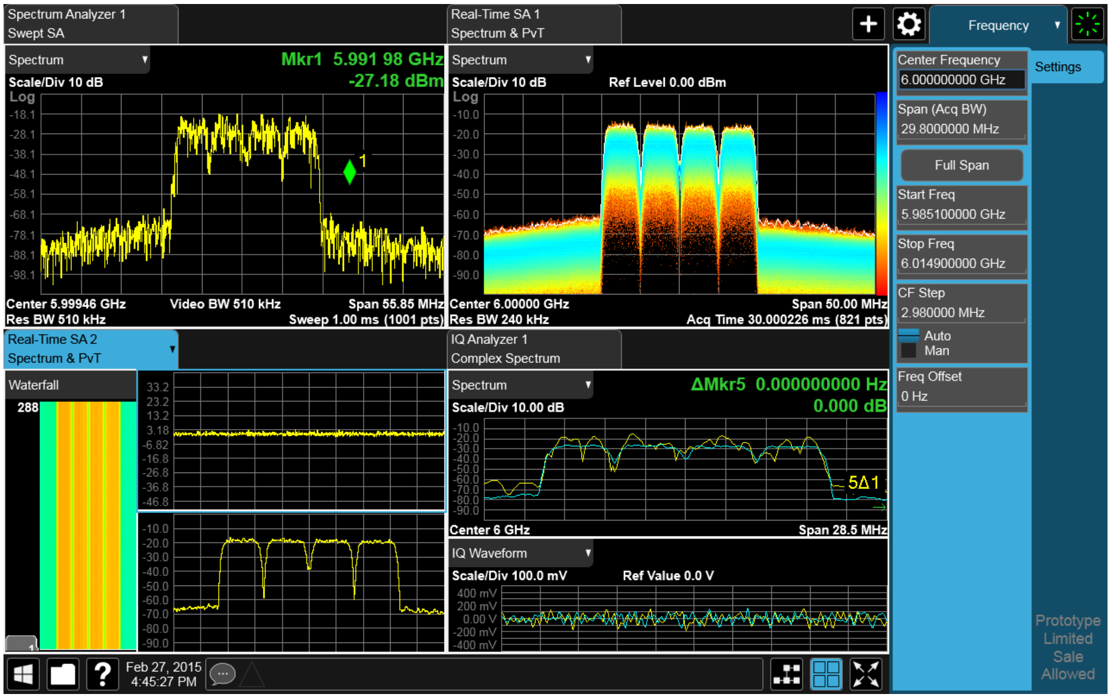
The + tab at the right of the Screen Tabs bar adds a new Screen by cloning the current screen. The new Screen has the identical setup and settings as the current Screen. You can then change the Mode, Measurement and/or settings of the new Screen.

You can define up to 16 screens at once.

Example Multiscreen View

The example below shows a four-screen display in Multiscreen view.

The Screen called “Real-Time SA 2” is selected, as indicated by its blue tab. Touching any other screen or tab selects the screen for that tab and brings it to the foreground.



Center Frequency 6.000000000 GHz
Span (Acq BW) 29.8000000 MHz
Start Freq 5.985100000 GHz
Stop Freq 6.014900000 GHz
CF Step 2.980000 MHz
Auto
Man
Freq Offset 0 Hz

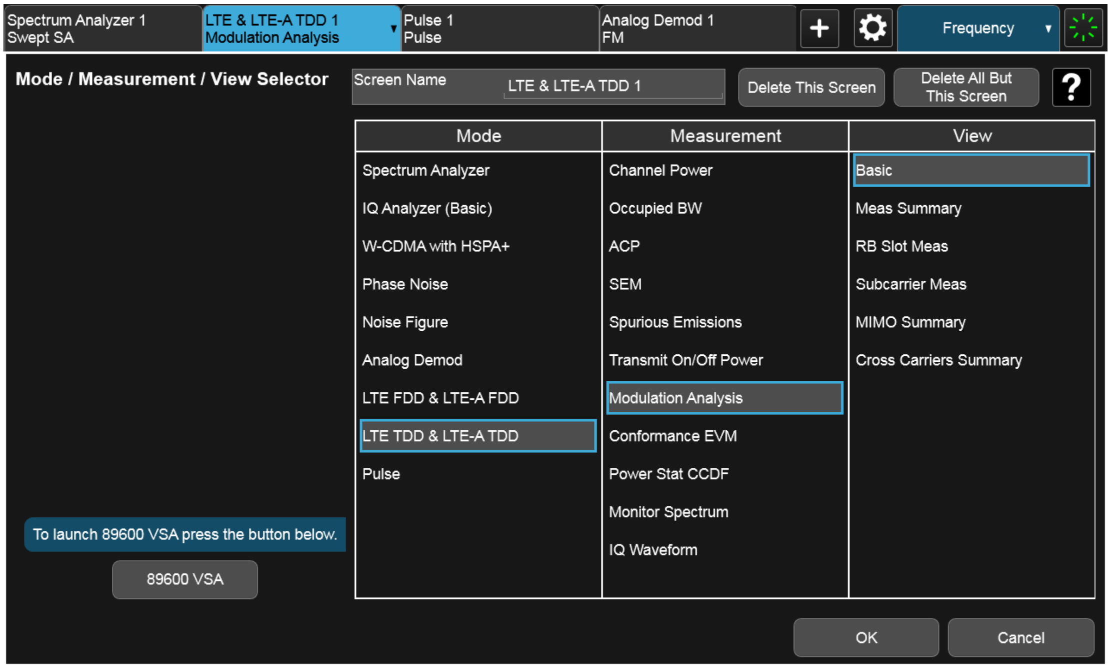
The following topics provide more information:

- "Mode/Meas/View Dialog" on page 105
- "Add Screen" on page 122
- "Multiscreen" on page 193

2.1.1 Mode/Meas/View Dialog

The Mode/Meas/View dialog opens when you press the selected (blue) Screen tab (see "Screen Tabs" on page 104) or the **Mode/Meas** front panel key.

This dialog displays lists of available Modes, Measurements and Views, as well as the "Sequencer" on page 116 control for configuring Screens.



2.1.1.1 Mode

The first column in the Mode/Meas/View dialog allows you to select the desired Mode from those currently licensed in your instrument.

Modes, also known as “measurement applications”, are collections of measurement capabilities packaged together to provide you with an instrument personality specific to your measurement needs. Each Mode is ordered separately by Model Number and must be licensed in order for it to be available in the instrument.

You select the Mode you want to run using the Mode/Meas/View dialog. Once a Mode is selected, only the commands that are valid for that mode can be executed

For more information on Modes, preloading Modes, and memory requirements for Modes, see "More Information" on page 109

The `:INSTrument[:SELect]` command is used to remotely select a Mode by sending the instrument a parameter which represents the name of the desired Mode. The Mode Names may be found in the table under "Index to Modes" on page 108.

The `:INSTrument:NSELect` command is used to remotely select a Mode by sending the Mode Number of the desired Mode. See "Instrument Number Select" on page 107. The Mode Numbers may be found in the table under "Index to Modes" on page 108.

The `:INSTrument:CONFigure` command causes a Mode and Measurement switch at the same time. This generally results in faster overall switching than sending the

`:INSTrument:SELect` and `CONFigure` commands separately. See "Mode and Measurement Select" on page 107.

Remote Command	`:INSTrument[:SELect] <mode_id>`
	where `<mode_id>` is one of the values listed in "Index to Modes" on page 108 below
	`:INSTrument[:SELect]?`

Example	`:INST SA`
Notes	A list of the valid mode choices is returned by the `:INST:CAT?` query
Preset	The default Mode is set to `SA` on **Restore System Defaults->All**, unless noted below: For N8973B, N8974B, N8975B, or N8976B: `NFIG`
State Saved	Saved in instrument state
Annunciation	Application Title is in the Screen Tab

Instrument Number Select

Remote Command	`:INSTrument:NSELect <integer>` `:INSTrument:NSELect?`
Example	`:INST:NSEL 1`
Notes	The Mode Numbers may be found in the table under "Index to Modes" on page 108 SA mode is number 1 The command is sequential: that is, continued parsing of commands cannot proceed until the instrument select is complete and the resultant SCPI trees are available
Preset	The default Mode is set to `1` by **Restore System Defaults->All**, unless noted in the table above
State Saved	Saved in instrument state

Mode and Measurement Select

Remote Command	`:INSTrument:CONFigure:<mode_id>:<meas>` where `<mode_id>` is a valid parameter for the `:INST:SEL` command and `<meas>` is a valid parameter for the `:CONF` command in the Mode specified by `<mode>`

Example	`:INST:CONF:SA:SAN`
	selects the Spectrum Analyzer mode and the Swept SA measurement
	`:INST:CONF:WCDMA:RHO`
	selects the WCDMA mode and the Mod Accuracy measurement

Notes	The available parameters for `<mode_id>` are dependent upon installed and licensed applications resident in the instrument. The available parameters for `<meas>` are dependent on the `<mode_id>` parameter and the valid measurements available for that mode, which can depend on model numbers and installed options In general this command will execute more quickly than sending the equivalent separate `:INST:SEL`

and `:CONF` commands

Index to Modes

The Mode Number in the table below is the parameter for use with the `:INSTrument:NSELect` command. The Mode Parameter is the parameter for use with the `:INSTrument[:SELect]` command. Your actual choices will depend upon which applications are installed in your instrument.

Mode	Mode Number	Mode Parameter <mode_id>
5G NR	109	`NR5G`
89601 VSA	101	`VSA89601`
Analog Demod	234	`ADEMOD`
Avionics	232	`AVIONIC`
Bluetooth	228	`BTooth`
Channel Quality / Group Delay	161	`CQM`
EMI Receiver	141	`EMI`
GSM/EDGE/EDGE Evo	13	`EDGEGSM`
I/Q Analyzer (Basic)	8	`BASIC`
LTE FDD & LTE-A FDD	107	`LTEAFDD`
LTE TDD & LTE-A TDD	108	`LTEATDD`
Measuring Receiver	233	`MRECEIVE`
MSR	106	`MSR`
Noise Figure	219	`NFIGure`
Phase Noise	14	`PNOISE`
Power Amplifier	81	`PA`
Pulse	151	`PULSEX`
Radio Test	300	`RTS`
Real Time Spectrum Analyzer	2	`RTSA`
Remote Language Compatibility	266	`RLC`
SCPI Language Compatibility	270	`SCPILC`
Sequence Analyzer	123	`SEQAN`
Short Range Comms	218	`SRCOMMS`
Spectrum Analyzer	1	`SA`
Vector Modulation Analyzer	200	`VMA`
WCDMA with HSPA+	9	`WCDMA`
WLAN	217	`WLAN`

More Information

The Mode name appears on the Screen Tab, followed by a number identifying which instance of the Mode appears on that screen. Each Screen contains one Mode. For example, in the image below, there is one Real-Time Spectrum Analyzer screen, and two Spectrum Analyzer screens. The current Screen contains **Real-Time SA 1**.

It is possible to specify the order in which the Modes appear in the Mode menu, using the **Configure Applications** utility on the Desktop. Using the same utility, it is also possible to specify a subset of the available applications to load into memory at startup time, which can decrease the startup time of the instrument and the amount of memory consumed.

Each application (Mode) that runs in an X-Series instrument consumes virtual memory. The various applications consume varying amounts of virtual memory, and as more applications run, the memory consumption increases. Keysight characterizes each Mode and assigns a memory usage quantity based on a conservative estimate. The **Configure Applications** utility shows an estimate for how much memory each Mode will consume.

You can still run a Mode even if it is not preloaded into memory – during runtime, the first time an application that is not loaded into memory is selected (either by pressing that application's **Mode** key or by sending that application's `:INST:SEL` command), the Application will be loaded, but this takes a few seconds. The instrument will pause while loading the application while displaying a message box that says “Loading application, please wait...” Preloading the application eliminates this wait time *but* consumes additional memory.

2.1.1.2 Application Mode Remote Commands

This section contains a number of remote commands that are provided for programming convenience and remote compatibility.

Application Mode Catalog Query (Remote Command Only)

Returns a string containing a comma-separated list of names of all the installed and licensed measurement modes (applications). These names can only be used with `:INSTrument[:SELect]`.

Remote Command	`:INSTrument:CATalog?`

Example	`:INST:CAT?`
Notes	Query returns a quoted string of the installed and licensed modes separated with a comma. Example: `"SA,PNOISE,WCDMA"`

Backwards Compatibility Notes	VSA (E4406A): `:INSTrument:CATalog?` returned a list of installed `INSTrument:SELECT` items as a comma separated list of string values, for example:
	`"BASIC","GSM","EDGEGSM","CDMA","SERVICE"`
	X-Series uses the ESA/PSA compatible query of a string contain comma separated values:
	`"SA,PNOISE,NFIG,BASIC"`

Current Application Model (Remote Command Only)

Returns a string that is the Model Number of the currently selected application (mode). This information is also displayed in the **Show System** screen.

Remote Command	`:SYSTem:APPLication[:CURRent][:NAME]?`
Example	`:SYST:APPL?`
Notes	Query returns a quoted string that is the Model Number of the currently selected application (Mode). Example: "N9060A" String length between 6 to 9 characters.
Preset	Not affected by Preset
State Saved	Not saved in state, the value will be the selected application when a Save is done.

Current Application Revision (Remote Command Only)

Returns a string that is the Revision of the currently selected application (mode). This information is also displayed in the Show System screen

Remote Command	`:SYSTem:APPLication[:CURRent]:REVision?`
Example	`:SYST:APPL:REV?`
Notes	Query returns a quoted string that is the Revision of the currently selected application (Mode). Example: "1.0.0.0" String length is a maximum of 23 characters. (each numeral can be an integer + 3 decimal points) The format is Major.Minor.Build.Compile, where Major must correspond to the Integer portion of the Version in the license file for the application.
Preset	Not affected by a Preset
State Saved	Not saved in state, the value will be the selected application when a Save is done.

Current Application Options (Remote Command Only)

Returns a string that is the Options list of the currently selected application (Mode). This information is also displayed in the Show System screen

Remote Command	`:SYSTem:APPLication[:CURRent]:OPTion?`
Example	`:SYST:APPL:OPT?`
Notes	Query returns a quoted string that is the Option list of the currently selected application (Mode). The format is the name as the *OPT? or SYSTem:OPTion command: a comma separated list of option identifiers. Example: "1FP,2FP" String length is a maximum of 255 characters.
Preset	Not affected by a Preset
State Saved	Not saved in state per se, the value will be the selected application when a Save is invoked.

Application Catalog Number of Entries (Remote Command Only)

Returns the number of installed and licensed applications (Modes).

Remote Command	`:SYSTem:APPLication:CATalog[:NAME]:COUNt?`
Example	`:SYST:APPL:CAT:COUN?`
Preset	Not affected by Preset
State Saved	Not saved in instrument state.

Application Catalog Model Numbers (Remote Command Only)

Returns a list of Model Numbers for the installed and licensed applications (Modes).

Remote Command	`:SYSTem:APPLication:CATalog[:NAME]?`
Example	`:SYST:APPL:CAT?`
Notes	Returned value is a quoted string of a comma separated list of Model Numbers. Example, if SAMS and Phase Noise are installed and licensed: "N9060A,N9068A" String length varies based on licenses. Licenses are between 6 and 9 characters. So the string length will be between COUNt * 7 – 1 and COUNt * 10 – 1. (7 & 10 = Model Number length + 1 for comma. -1 = no comma for the 1st entry.)
Preset	Not affected by a Preset
State Saved	Not saved in instrument state.

Application Catalog Revision (Remote Command Only)

Returns the Revision of the provided Model Number.

Remote Command	`:SYSTem:APPLication:CATalog:REVision? <model>`
Example	`:SYST:APPL:CAT:REV? ‘N9060A’`
Notes	Returned value is a quoted string of revision for the provided Model Number. The revision will be a null-string ("") if the provided Model Number is not installed, licensed, and loaded. Example, if SAMS is installed and licensed: "1.0.0.0" String length is a maximum of 23 characters. (each numeral can be an integer + 3 decimal points)
Preset	Not affected by a Preset.
State Saved	Not saved in instrument state.

Application Catalog Options (Remote Command Only)

Returns a list of Options for the provided Model Number

Remote Command	`:SYSTem:APPLication:CATalog:OPTion? <model>`
Example	`:SYST:APPL:CAT:OPT? ‘N9060A’`
Notes	Returned value is a quoted string of a comma separated list of Options, in the same format as *OPT? or :SYSTem:OPTion?. If the provided Model Number is not installed and licensed a null-string ("") will be returned. Example, if SAMS is installed and licensed: "2FP" String length is a maximum of 255 characters.
Preset	Not affected by a Preset
State Saved	Not saved in instrument state.

ESA SA compatibility command (Remote Command only)

Provided for backwards compatibility with ESA. When this command is received, the analyzer aliases it to the appropriate Mode.

Remote Command	`:INSTrument[:SELect] ‘SA’ | ’PNOISE’ | ’EDGE’ | ’GSM’ | ’BASIC’`
Example	`:INST ‘SA’`
Notes	The query is not a quoted string. It is an enumeration as indicated in the Instrument Select table above

GSM Mode compatibility command (Remote Command only)

Provided for backwards compatibility. When this command is received, the analyzer aliases it to the following:

`:INST:SEL EDGEGSM`

Remote Command	`:INSTrument[:SELect] GSM`
Example	`:INST GSM`

SA compatibility command for EMC (Remote Command only)

Provided for ESU compatibility. When this command is received, the analyzer aliases it to the following:

`:INST:SEL SCPILC`

This results in the analyzer being placed in SCPI Language Compatibility Mode, in order to emulate the ESU Spectrum Analyzer Mode.

Remote Command	`:INSTrument[:SELect] SANalyzer`
Example	`:INST SAN`

Receiver compatibility command for EMC (Remote Command only)

Provided for ESU compatibility. When this command is received, the instrument aliases it to the following:

`:INST:SEL EMI`

`:CONF FSC`

This results in the instrument being placed in the EMI Receiver Mode, running the Frequency Scan measurement, in order to emulate the ESU Receiver Mode.

Remote Command	`:INSTrument[:SELect] RECeiver`
Example	`:INST REC`

APD compatibility command for EMC(Remote Command only)

Provided for ESU compatibility. When this command is received, the analyzer aliases it to the following:

`:INST:SEL EMI`

`:CONF APD`

This results in the analyzer being placed in the EMI Receiver Mode, running the APD measurement, in order to emulate the ESU APD Mode.

Remote Command	`:INSTrument[:SELect] APDistribution`
Example	`:INST APD`

IF Mode compatibility command for EMC (Remote Command only)

Provided for ESU compatibility. When this command is received, the analyzer aliases it to the following:

`:INST:SEL EMI`

`:CONF MON`

This results in the analyzer being placed in the EMI Receiver Mode, running the Monitor Spectrum measurement, in order to emulate the ESU IF Mode.

Remote Command	`:INSTrument[:SELect] IFANalyzer`
Example	`:INST IFAN`

2.1.1.3 Measurement

The Measurement column of the Mode/Meas/View dialog shows all the Measurements available for the Mode which is selected in the first column. Select a Measurement in the second column and the View column will show all the Views available for that measurement. Once you have the Mode, Measurement and View selected, press OK to change the current Screen to that Mode, Measurement and View.

2.1.1.4 View

A View is a collection of Result Windows. The View column of the "Mode/Meas/View Dialog" on page 105 shows all the Views available for the Measurement which is selected in the second column. Once you have the Mode, Measurement and View selected, press OK to change the current Screen to that Mode, Measurement and View.

The View may also be set by using the View tab on the Display menu. The View tab is the last tab on the Display menu for every measurement. The Views are the same as those listed in the "Mode/Meas/View Dialog" on page 105.

2.1.1.5 Sequencer

Allows multiple Screens to update sequentially while in "Multiscreen" on page 193 display mode. Each Screen updates in sequence, and when all have updated, the sequence will start again.

To start the Sequencer, you must have more than one Screen defined, and you must have Multiscreen selected (see "Screen Tabs" on page 104).

If you want each Screen to use a different input, you must turn off **All Screens Use Same Input** under **Input/Output**, **Input**.

CAUTION Differences in hardware settings between the Screens may cause switches and/or attenuators to cycle as you go from one Screen to another. This could potentially reduce the life of these components. To avoid this, make sure **Attenuation**, **µW Path Control** and other switch settings are the same in each Screen.

NOTE When the Sequencer is running, the destination of remote commands is unpredictable, so you should stop the Sequencer before sending any measurement-related commands. Once the Sequencer has stopped, select a specific Screen using `:INSTrument:SCReen:SELect`, before sending any further commands. See "Select Screen" on page 195

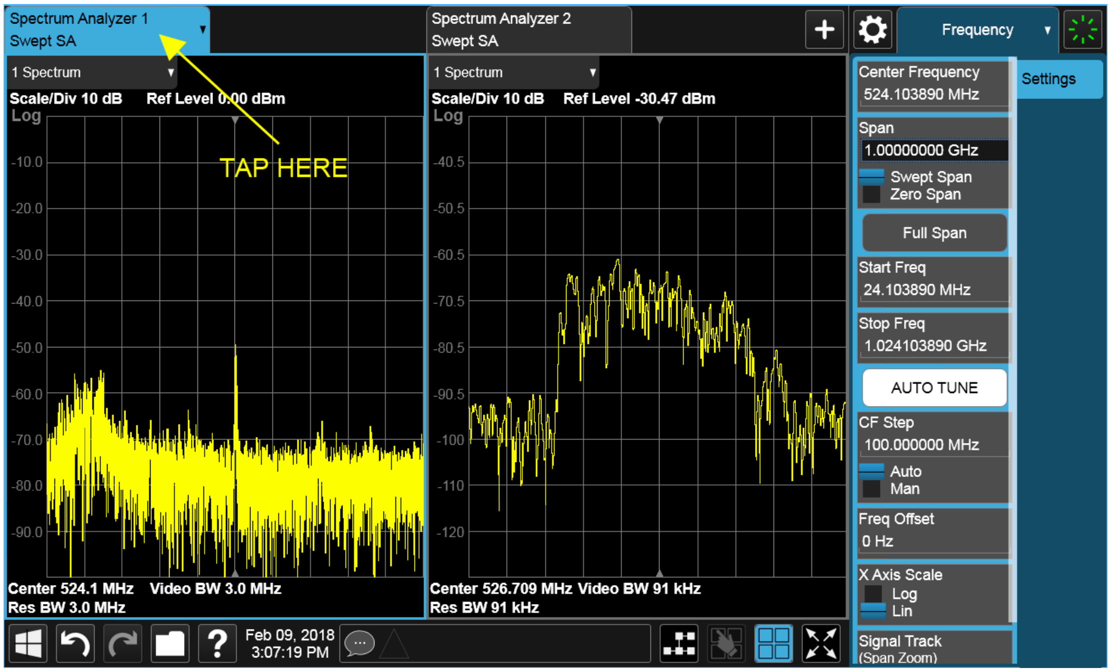
NOTE When the Sequencer is running, Auto alignment is temporarily disabled. A pending auto alignment might be executed when the sequencer is stopped.

See "More Information" on page 116

Remote Command	`:SYSTem:SEQuencer ON | OFF | 1 | 0` `:SYSTem:SEQuencer?`
Example	`:SYST:SEQ ON`
Notes	If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” is generated
Dependencies	To start the Sequencer, you must have more than one Screen defined and you must have Multiscreen selected
Preset	`OFF`

More Information

To start the Sequencer, tap the current (blue) Screen tab to go into the Mode/Meas/View Dialog:



Scale/Div 10 dB Ref Level 0.00 dBm

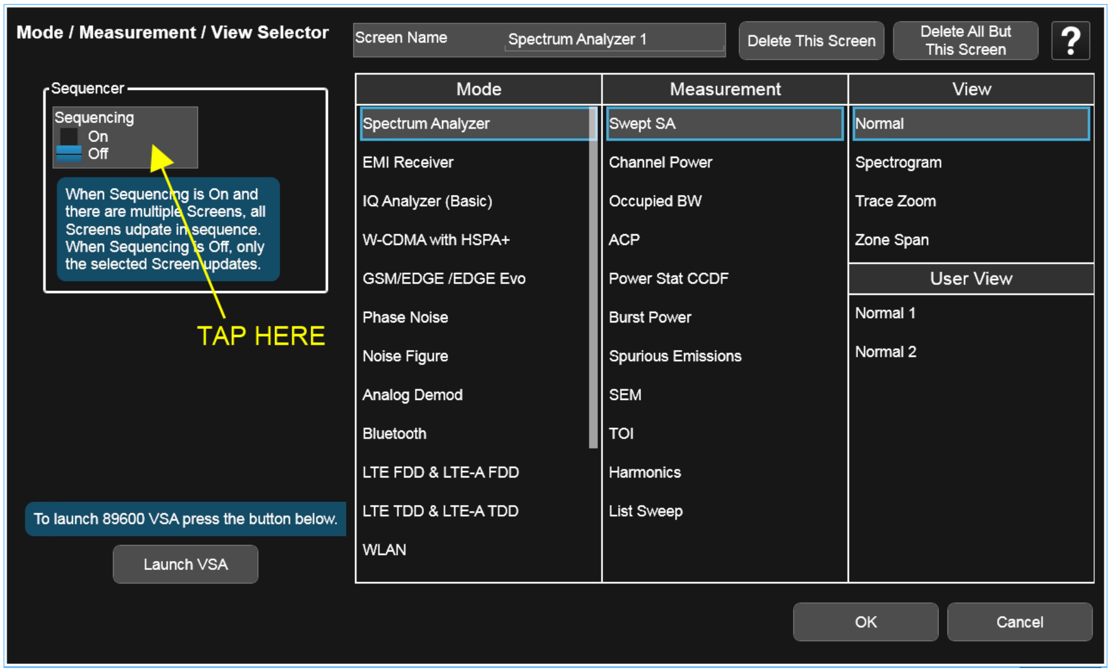
In the Sequencer block in the upper left hand corner, tap the Sequencing switch to turn it On:



When Sequencing is On and there are multiple Screens, all Screens udpate in sequence. When Sequencing is Off, only the selected Screen updates.

To launch 89600 VSA press the button below.

The instrument will immediately exit the Mode/Meas/View Dialog and begin making measurements in each of the screens, one after the other. When a measurement is being made in a particular Screen, that Screen’s tab will be blue.

X Axis Scale

Touching any key or control on the display will cause the Sequencer to stop, so that you can make desired changes. When this happens, the message “Sequencer stopped” is displayed.

When the Sequencer is running, the screens update in the order in which they were created.

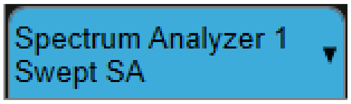
Each Screen takes one measurement then passes control to the next Screen. Each Screen updates as though it were in Single Sweep or Single Measurement mode. Thus, if Averaging is on, a Screen may take multiple sweeps before moving on to the next Screen.

2.1.1.6 Screen Name

By default, the screen name is the Mode (Application) name followed by a number indicating the instance of the application.

You may change the name displayed on the Screen Tab of any screen. The control to do this appears in the "Mode/Meas/View Dialog" on page 105:

Screen Name Spectrum Analyzer 1



When you touch this control an onscreen keyboard appears, allowing you to change the name. Whatever you change it to appears on the Tab, even if you subsequently change the screen to a different Mode.

Screen Name My Screen

To reset the name, delete the screen name entirely.

Each Screen Name must be unique; you cannot give the same name to more than one screen.

Remote Command	`:INSTrument:SCReen:REName <alphanumeric>`
Example	`:INST:SCR:REN “Baseband”`
Notes	The currently active screen is renamed. If the `<alphanumeric>` specifying the new name is already present in the list of screen names, the error message “-224, Illegal parameter value; New name <name> already exists” appears If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” appears

2.1.1.7 Delete This Screen

Pressing this button deletes the current Screen (the one with the blue tab). Deleting a screen removes it from view and selects the next lower screen in the list of screens. If only one screen is configured, it cannot be deleted.

If you press the **Delete This Screen** button, a prompt appears:

“This function will delete the current screen and its settings. This action cannot be undone. Do you want to proceed?”

Pressing **OK** or Enter deletes the screen, pressing **Cancel** or **ESC** does not.

Remote Command	`:INSTrument:SCReen:DELete`
Example	`:INST:SCR:DEL`
Notes	The currently active screen is deleted If the screen you are attempting to delete is the only configured screen, the error message “-221, Settings conflict; Last screen cannot be deleted” is displayed If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” is generated

2.1.1.8 Delete All But This Screen

Pressing this control deletes all the Screens except the current Screen (the one with the blue tab).

If you press the **Delete All But This Screen** button, a prompt appears:

"This function will delete all defined screens and their settings, except for the current screen. This action cannot be undone. Do you want to proceed?"

Pressing **OK** or Enter deletes the screen, pressing **Cancel** or ESC does not.

Remote Command	`:INSTrument:SCReen:DELete:ALL`
Example	`:INST:SCR:DEL:ALL`
Notes	You can reset the instrument to the power-on configuration by invoking `:INST:SCR:DEL:ALL` followed by `:SYSTem:DEFault ALL` If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; Screen SCPI cannot be used when Display is disabled" appears

2.1.1.9 89600 VSA

Pressing this button launches the 89600 VSA software. The 89600 VSA software is powerful, PC-based software, offering the industry's most sophisticated general purpose and standards specific signal evaluation and troubleshooting tools for R&D engineers. Even for proprietary and non-standard signals in SATCOM or MILCOM applications, you can make signal quality measurements with customized IQ constellation.

The 89600 VSA software offers the following features:

- Over 35 general-purpose analog and digital demodulators ranging from 2FSK to 4096QAM
- Flexible and custom IQ and OFDM signal analysis for single carrier
- Standards specific modulation analysis including:
  - Cellular: GSM/EDGE, cdma2000, W-CDMA, TD-SCDMA, LTE(FDD/TDD),
  - LTE-Advanced and more
  - Wireless networking: 802.11a/b/g, 802.11n, 802.ac, 802.16 WiMAX (fixed/mobile), WiSUN (MR-FSK PHY)
  - RFID
  - Digital satellite video and other satellite signals, radar, LMDS
- Up to 400K bin FFT, for the highest resolution spectrum analysis
- A full suite of time domain analysis tools, including signal capture and playback, time gating, and CCDF measurements
- 20 simultaneous trace displays and the industry's most complete set of marker

functions

- Easy-to-use Microsoft Windows graphical user interface

For more information see the Keysight 89600 Series VSA web site at www.keysight.com/find/89600vsa

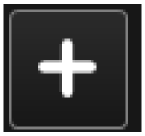
To learn more about how to use the 89600 VSA in the instrument, start the 89600 VSA software, then open the 89600 VSA Help and navigate to the topic "About Keysight X-Series Signal Analyzer with 89600 VSA Software".

Example	`:INST:SEL VSA89601` `:INST:NSEL 101`

2.1.2 Add Screen

On X-Series analyzers you can configure up to 16 different Screens at one time. Each Screen contains one Mode, each Mode contains one Measurement, and each Measurement contains a number of Windows.

You can add screens by pressing the “+” icon in the "Screen Tabs" on page 104 panel. The icon is shown below:



Every time you add a Screen, the instrument “clones” or “copies” the current Screen into the new Screen. If desired, you can then use the "Mode/Meas/View Dialog" on page 105 to change the Mode, Measurement and/or View of the new Screen, or simply operate a second copy of your previous Screen, thus preserving the settings of your previous Screen.

When you have defined the maximum number of Screens (16), the “+” icon disappears.

For more information about operating the instrument with multiple screens configured, see "Multiscreen" on page 193.

Remote Command	`:INSTrument:SCReen:CREate`
Example	`:INST:SCR:CRE`
Notes	The maximum number of screens is 16. If an attempt to add a screen occurs when the maximum have been defined, the error message “-221, Settings conflict; Screen limit reached” appears When you create a new screen the Screen Name is the current Mode name followed by a number indicating the instance of the Mode.

If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” appears

2.2 Meas Bar

The Meas Bar is used to display annotation for the current measurement. There are three primary uses for the Meas Bar:

1. To show annotation for the most important parameters in the measurement so you can see them at a glance
2. To show the annotation that you will most want to have recorded in a screen dump
3. To give you quick access to settings.

Input: RF
Coupling: DC
Ext Gain: 10 dB
Align: Auto/No RF

Input Z: 50 Ω
Corr CC RCal
Freq Ref: Internal
NFE: On

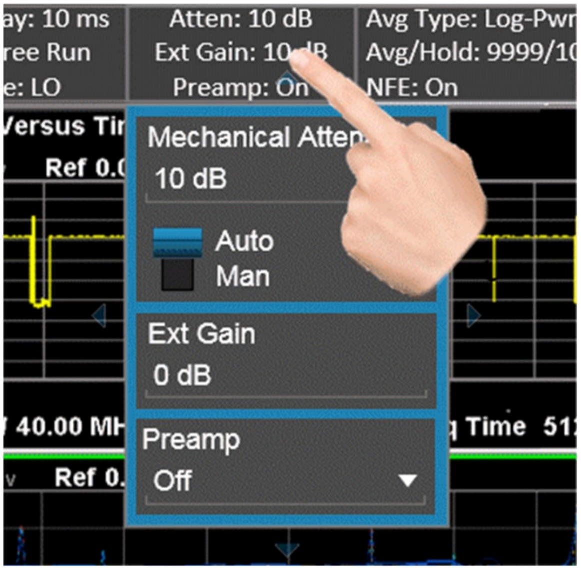
Atten: 10 dB
Preamp: 13.6 GHz
μW Path: LNP, On
Source: Off

PNO: Fast
Gate: LO
IF Gain: Low
Sig Track: On

Avg Type: Log-Pwr
Avg/Hold:>9999/10000
Trig: Free Run
Trig Delay: 10 ms

The Meas Bar is made up of a number of annotation panels, each of which, when pressed, opens up a dialog below it which contains controls for those settings.

For example, here is what the display looks like when you touch one of the regions of the Meas Bar:



Atten: 10 dB
Ext Gain: 10 dB
Preamp: On

Mechanical Atten
10 dB

Ext Gain
0 dB

Preamp
Off

Touching anywhere off the hotspot panel or pressing any hardkey except **Save** or **Quick Save** closes the hotspot panel.

In a hotspot panel, the control in black with the blue border is the active function. Each panel may have its own default active function.

Settings that are colored amber are those that you need to be particularly aware of; for example, if Alignments are off, this is shown in amber, so you will know that you may not be meeting spec. Similarly, if DC coupling is on, this is shown amber, to alert you to be careful what voltage you put on the input.

You can turn the Meas Bar on and off with a switch on the Annotation tab of the Display menu.

System Control Panel

The leftmost panel holds the GPIB/Remote annunciators, the Single/Continuous symbol/control, the LXI indicator and the PASS/FAIL indicator. Tapping this panel drops down controls for Single/Continuous, Pause/Resume and restart.

GPIB/Remote annunciators

The GPIB/Remote annunciators are shown as the letters `KRLTS`. Each letter is shown if the state is true and is not shown if the state is false, as follows:

K	Keylock indicator	This is shown when the instrument is in the Keylock state (turned on and off by the `SYST:KLOCk` command)
R	Remote annunciator	Shown when the instrument is in the remote state, as when being controlled via the IEEE-488 bus (GPIB) or TCP/IP connections
L	GPIB Listen annunciator	Shown when addressed to listen via GPIB orTCP/IP
T	GPIB Talk annunciator	Shown when addressed to talk via GPIB or TCP/IP
S	GPIB SRQ annunciator	Shown when the instrument is asserting SRQ on GPIB. This annunciator is an amber color

Single/Continuous symbol/control

This annunciator shows as an arrow on an oval line when in Continuous, or an arrow on a straight line when in Single.

LXI indicator

This indicator displays in green when LAN is connected, in white when LAN is not connected, and in red when LAN is connected but has a connection problem.

PASS/FAIL indicator

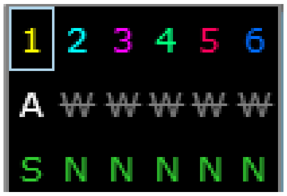
This annunciator displays when Limits are turned on. It is green if all Limits are passing, and a red FAIL if any limit is not passing.

The following command queries the status of the current measurement limit testing. It returns a 0 if the measured results pass when compared with the current limits. It returns a 1 if the measured results fail any limit tests.

Remote Command	`:CALCulate:CLIMits:FAIL?`
Example	`:CALC:CLIM:FAIL?` queries the current measurement to see if it fails the defined limits Returns a 0 or 1: 0 it passes, 1 it fails

Trace Detector Settings Panel

In the Swept SA and some other measurements, there is a special panel summarizing the settings for the traces in the measurement:



1	2	3	4	5	6
A	~~W~~	~~W~~	~~W~~	~~W~~	~~W~~
S	N	N	N	N	N

There is one column for each trace. The rows are as follows:

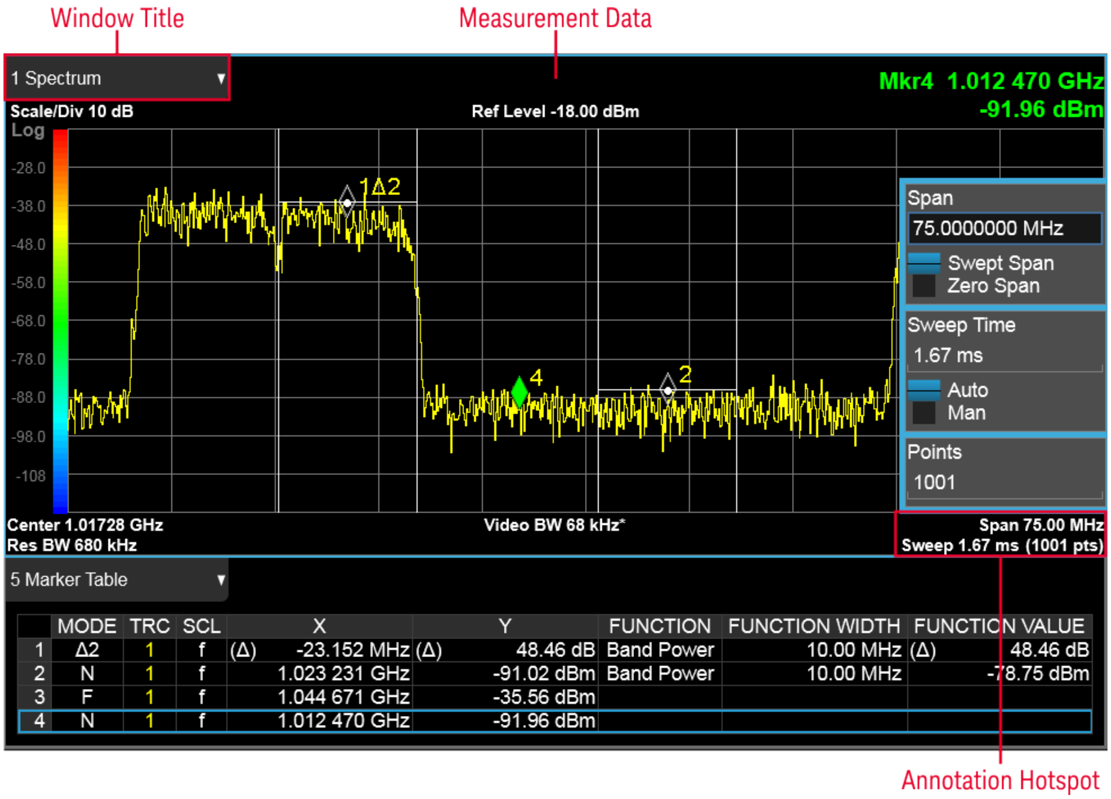
- The top row shows the Trace Number, in the trace color.
- The second row shows the Trace Type for each trace (W=Clear/Write, A=Trace Average, M=Max Hold, m=Min Hold); this letter is in white if the trace is Active, in gray if the trace is inactive; there is a bar through the letter if the trace is not being displayed
- The third row shows the detector for each trace (N=Normal, S=Sample, A=Average, P=peak, p=negative peak, Q=Quasi Peak, E=EMI Average, R=RMS Average, f=math function)

In the example above, trace 1 is active, visible, and in Average using the Sample detector, the other traces are inactive, blanked and in Clear/Write using the Normal detector.

Tapping this panel drops down controls for the Traces.

2.3 Measurement Display

The Measurement Display contains one or more data windows displaying the result of the current measurement. These may be graphical or textual windows.



Mkr4 1.012 470 GHz
-91.96 dBm

Scale/Div 10 dB

Ref Level -18.00 dBm

	MODE	TRC	SCL	X	Y	FUNCTION	FUNCTION WIDTH	FUNCTION VALUE
1	Δ2	1	f	(Δ) -23.152 MHz	(Δ) 48.46 dB	Band Power	10.00 MHz	(Δ) 48.46 dB
2	N	1	f	1.023 231 GHz	-91.02 dBm	Band Power	10.00 MHz	-78.75 dBm
3	F	1	f	1.044 671 GHz	-35.56 dBm			
4	N	1	f	1.012 470 GHz	-91.96 dBm			

Each window in the Measurement display contains a "Window Title" on page 128, "Measurement Data" on page 132, and graphical windows also may contain "Annotation Hotspot" on page 135.

The selected window in the Measurement Display is indicated by a blue border. Window-dependent controls in the menu panel always refer to the selected window.

2.3.1 Window Title

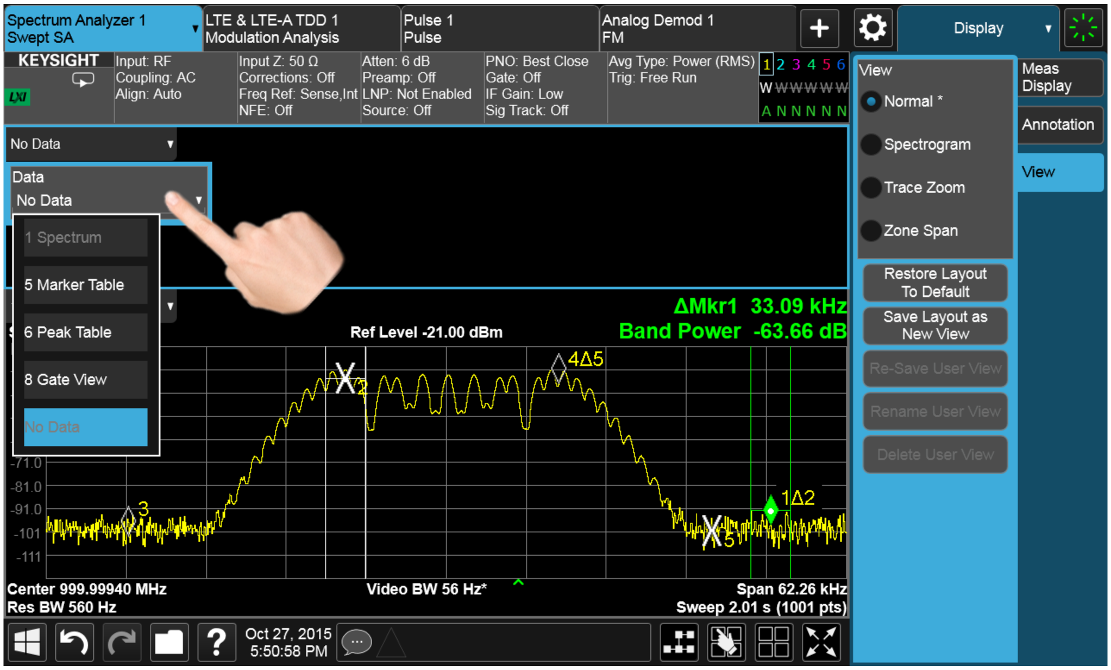
The Window Title appears in the upper left hand corner of the window, and includes a title describing the measurement data currently being displayed in the window. The title may also contain additional information about the data in the window, for example in the LTE measurement supplication, the component carrier being displayed in the window will be indicated (e.g., “CC0”).

Measurements that support User Views (see "View Editor" on page 172) also display the Window Number in the Window Title, to enable window addressing from SCPI. The number is the number that will be used in the SCPI command to address that window, for example, in the WCDMA Mod Accuracy measurement, Code Domain Power is assigned window number 6, so you address it with the following SCPI command:

```
:DISP:RHO:WIND6:TRAC:Y:RLEV 0.0
```

Note the arrow pointing down on the right side of the Window Title. This indicates that touching the Window Title will display a dropdown, which enables you to select the Measurement Data to be displayed in the window.

For example, if we wish to assign the results of the upper window in the display below to the Marker Table, we would touch the window title and then the "Data" control that is revealed, as shown:



Input: RF
Coupling: AC
Align: Auto
Input Z: 50 Ω
Corrections: Off
Freq Ref: Sense,Int
NFE: Off
Atten: 6 dB
Preamp: Off
LNP: Not Enabled

Carrier Power	-21.391 dBm	SINAD	23.925 dB
Carrier Freq Err	-425.6 Hz	SNR	24.417 dB
Mod Rate	1000.0 Hz	Dist/Total Vrms	6.364 %
		THD	2.087 %

There are many gestures which you can use to interact with a measurement display window. They are detailed below.

Swipe

There are several swipe actions, as listed below. One of the most important actions is swiping a spectrum window to the left or right, or up or down, to adjust the frequency and level of the spectrum, as shown below.

Input: RF
Coupling: AC
Align: Auto
Input Z: 50 Ω
Corrections: Off
Freq Ref: Sense,Int
NFE: Off
Atten: 6 dB
Preamp: Off
LNP: Not Enabled
Source: Off
PNO: Best Close
Gate: Off
IF Gain: Low
Sig Track: Off
Avg Type: Log-Power
Trig: Free Run
Scale/Div 10 dB
Ref Level -21 0 dBm
Center 999.99940 MHz
Res BW 560 Hz
Video BW 560 Hz
Span 62.26 kHz
Sweep 239 ms (1001 pts)

Swipe actions are summarized in the table below. Not all of these may be available, depending on the measurement.

Object	Action
Spectrum Trace Left/Right	Drag trace (change Center Frequency)
Spectrum Trace up/down	Drag trace (change Ref Level)
Marker Left/Right	Drag marker along trace
Fixed Marker Left/Right/Up/Down	Drag marker in space
Scrollable area	Scroll vertically or horizontally. Scrollable areas include the Menu Panel (if overfull), tables and lists. A scrollable area is indicated by a vertical or horizontal translucent white bar which can also be dragged by a mouse When scrolling a table: – Row headers remain in place when the table is scrolled horizontally, and scroll with the table when the table is scrolled vertically – Column headers remain in place when the table is scrolled vertically, and scroll with the table when the table is scrolled horizontally

Object	Action
Toggle control	Toggle in that direction

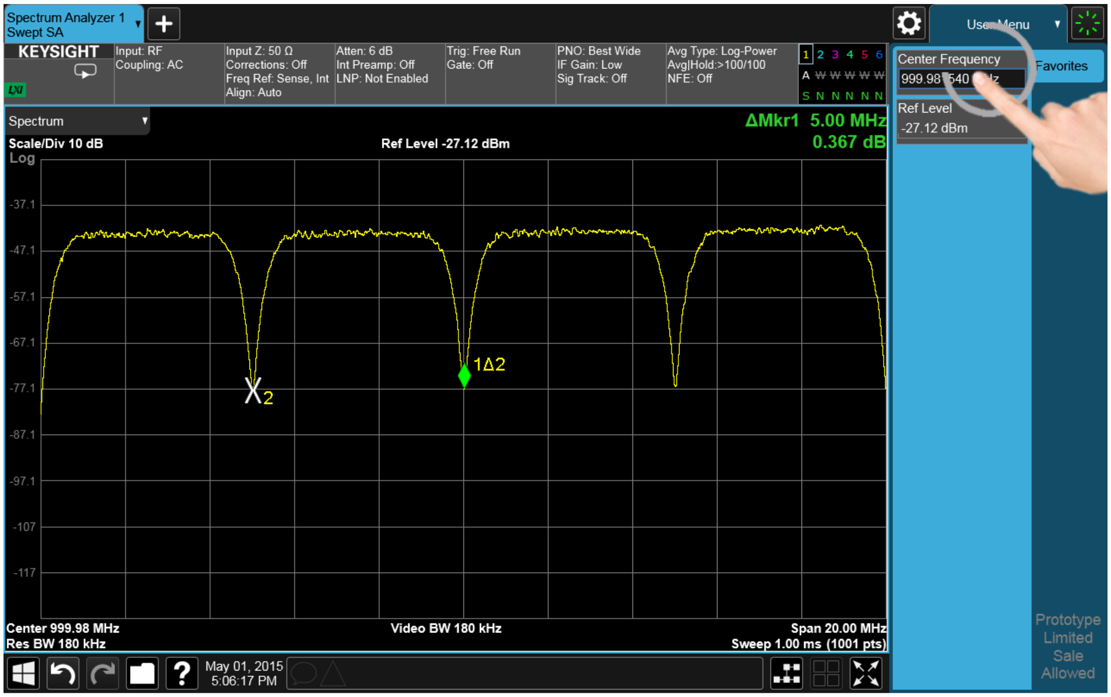
Pinch

You can also pinch in or out either horizontally or vertically to zoom in the x-axis or y-axis dimension. For example, a pinch horizontally lets you adjust the Span of the Spectrum window. Also, pinching on the wings of a Band Power or other Band Function allows you to widen or narrow that Band Function.

Pinching may sometimes be easier if you use the index finger of each hand, rather than pinching with one hand.

Touch-and-Hold

You can also touch-and-hold the display, that is, touch it and hold your finger on the display. A circle is drawn, and when the drawing completes, a right-click gesture is performed that depends on the screen feature touched, as listed in the table below.



Input: RF
Coupling: AC
Input Z: 50 Ω
Corrections: Off
Freq Ref: Sense, Int
Align: Auto
Atten: 6 dB
Int Preamp: Off
LNP: Not Enabled
Trig: Free Run
Gate: Off
PNO: Best Wide
IF Gain: Low
Sig Track: Off
Avg Type: Log-Power
Avg|Hold:>100/100
NFE: Off
ΔMkr1 5.00 MHz
0.367 dB
Scale/Div 10 dB
Ref Level -27.12 dBm
Center 999.98 MHz
Res BW 180 kHz
Video BW 180 kHz
Span 20.00 MHz
Sweep 1.00 ms (1001 pts)
Ref Level -27.12 dBm

Right Click on a Trace	Peak Search, Trace Type (Clear/Write, Trace Average, Max Hold, Min Hold), Trace View/Blank (Active, View, Blank, Background). Not all of these may be available, depending on the measurement
Right Click on a Marker	Marker Mode (Normal. Delta, Fixed, Off), Peak Search, Next Peak, Next Pk Right, Next Pk Left). Not all of these may be available, depending on the measurement

Right Click on the Background	Lets you select Help
Right Click on a Menu Panel control	Lets you add or remove that control from the User Menu or get Help on that control

Tap

Tapping an object causes the actions defined in the table below:

Object	Action
Marker	Select
Marker (repeated taps on stacked)	Cycle through stacked markers
Trace	Select. In addition if Marker is the active function, move the selected marker to the point where you tapped
Trace (repeated taps on stacked)	Cycle through stacked traces
Window	Select if unselected
Screen	Select if unselected

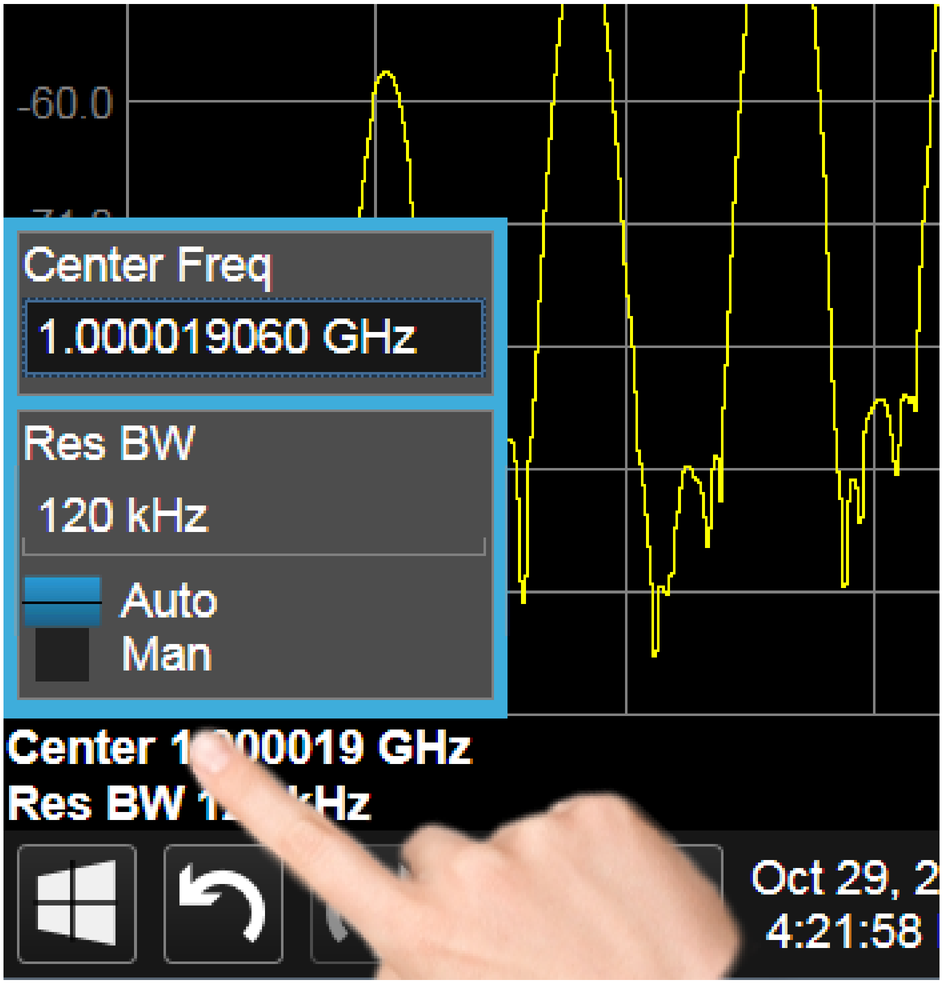
Double Tap

Double-tapping an object causes the actions defined in the table below:

Object	Action
Window	Zoom/Unzoom

2.3.3 Annotation Hotspot

You can tap on a graticule annotation to modify one of the fields in that annotation. For example if you tap on the region with Center Freq and Res BW in it, a menu panel pops up with just those settings on it.



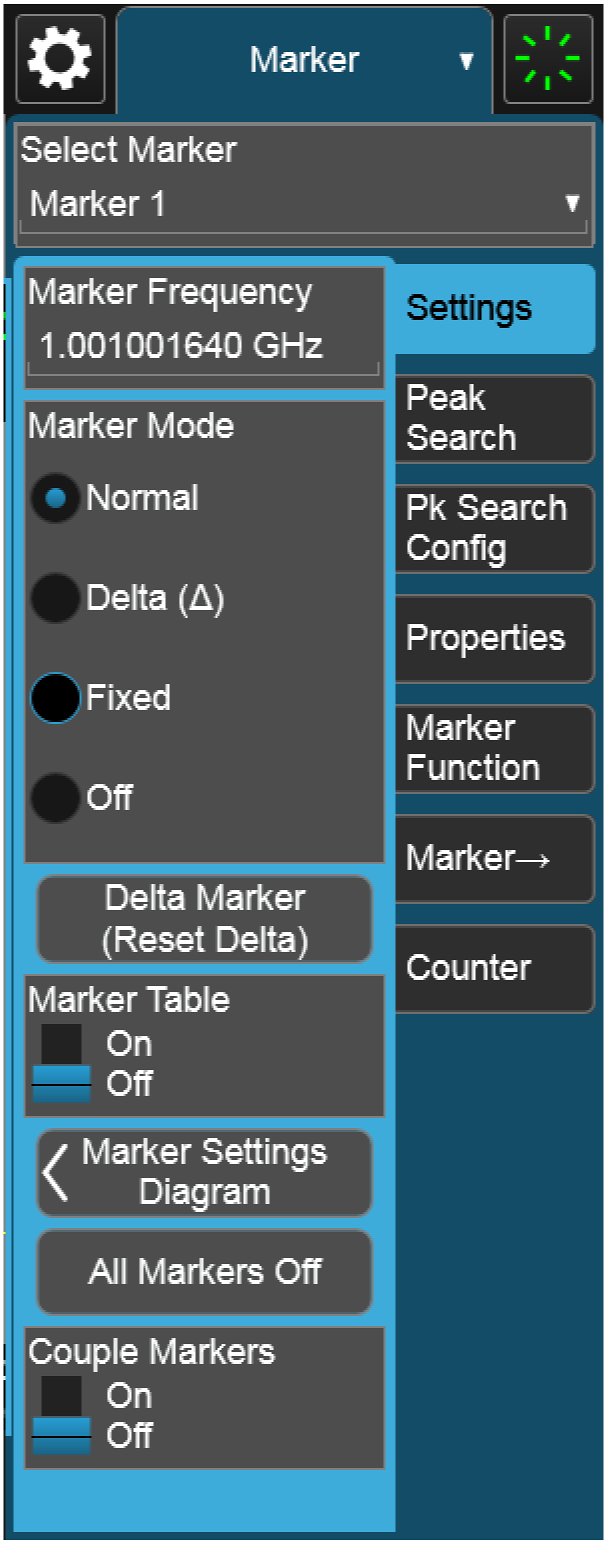
Touching anywhere off the hotspot panel or pressing any hardkey except **Save** or **Quick Save** closes the hotspot panel.

Annotation which is not currently able to be adjusted is not grayed out on the display, but the control in the hotspot that drops down or pops up is grayed out.

In a hotspot panel, the control in black with the blue border is the active function. Each panel may have its own default active function

2.4 Menu Panel

The menu panel is the main focus of the X-Series Multitouch user interface. The controls include active functions, dropdowns, action buttons, radio buttons and toggles.



Select Marker
Marker 1 ▾

Marker Frequency
1.001001640 GHz

Marker Mode
● Normal
○ Delta (Δ)
○ Fixed
○ Off

Marker Table
On
[✓ Off]

Couple Markers
On
[✓ Off]

The menu panel normally appears on the right side of the display and consists of a rectangular panel with multiple “sub-panels” lying on top of each other, each sub-panel being accessed by a tab on the right.

You press a front panel key (or “hardkey”) to access a particular menu. On the front panel there are twelve “measurement hardkeys” (the ones in the shaded region in the figures below) – these are the hardkeys that open up menus in the menu panel.

With a menu open, tap a tab to access the controls on its sub-panel. Whenever you press the front panel key associated with a menu, the default (top) tab is selected.

If the number of controls on a panel exceeds the height of the panel, scrolling is enabled, which is indicated by a white bar on the left that fades away after a few seconds. You swipe up or down with your finger to scroll the panel, or you can grab the white bar with a mouse.

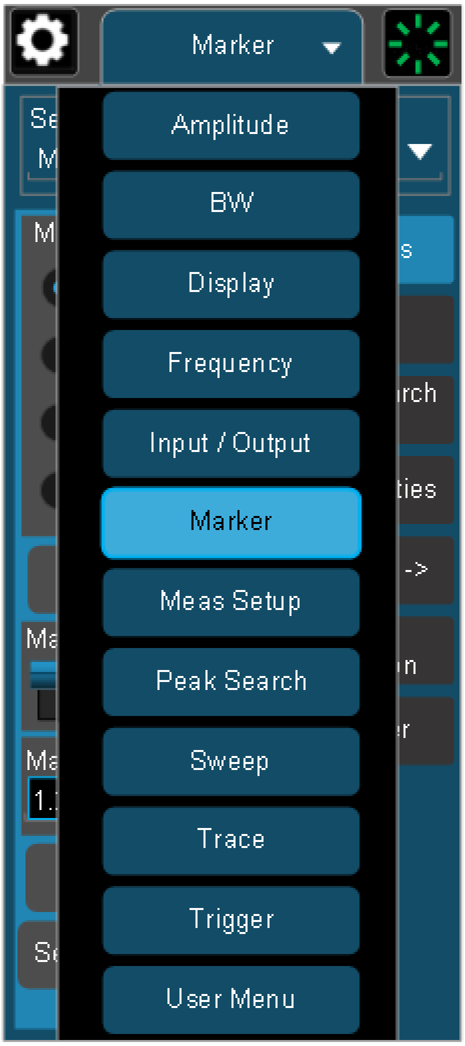
If you move to a different menu panel or sub-panel and then come back to a previous panel, the previous panel is always reset to be scrolled all the way back to the top.

Accessing Menus Without Using Front-Panel Keys

You can access the menu panels without using the front panel keys, as you would need to do if you were operating the instrument using Remote Desktop. Touch or click on the menu title, as shown below. A dropdown containing the twelve measurement hardkeys appears. Selecting a hardkey from the dropdown displays the corresponding menu, and the dropdown disappears.



Entering Numeric Values

Many controls on the menu panel allow you to enter numeric values. These are called “active functions.” An active function control displays a number and a suffix, for example 13.255 GHz, as in the example below:

Center Frequency

13.255000000 GHz

An active function is “active” if the numeric value is surrounded by a black background with a blue border, as below. In this state, it is ready to receive numeric input from the number pad on the front panel, the knob, or the step keys.

Center Frequency

13.255000000 GHz

When an active function is in the active state, you can start typing or pressing the number keys on the front panel, which causes the Numeric Entry Panel to appear, as shown below. The Numeric Entry Panel displays the typed value, and the terminators to complete the entry.

Here we see a UXA with an active function control in the active state. Although no Numeric Entry Panel is displayed, you can just touch the “2” key:

Center Frequency 13.255000000 GHz

Span 26.4900000 GHz

Start Freq 10.000000 MHz

Stop Freq 26.500000000 GHz

CF Step 2.649000000 GHz

Freq Offset 0 Hz

Span 26.49 GHz

p 66.5 ms (1001 pts)

This causes the Numeric Entry Panel to pop up to receive the numbers you are typing:

Type in as many digits as required, then touch one of the unit terminator buttons in the Numeric Entry Panel to complete the entry. In this case, 2 GHz was the desired entry, so you just touch the "GHz" terminator:

Center Frequency 13.255000000 GHz

Span 26.4900000 GHz

Start Freq 10.000000 MHz

Stop Freq 26.500000000 GHz

CF Step 2.649000000 GHz

Center Frequency 2

The Numeric Entry Panel disappears and, in the example, the active function value becomes 2 GHz.

Center Frequency
2.000000000 GHz

Span
4.16000000 GHz
● Swept Span
○ Zero Span

Start Freq
-80.000000 MHz

Stop Freq
4.080000000 GHz

CF Step
416.000000 MHz
● Auto
○ Man

Freq Offset
0 Hz

Signal Track
(Span Zoom)
○ On
● Off

Span 4.160 GHz
Sweep 6.93 ms (1001 pts)

It is important to note that you can always pop up the Numeric Entry Panel by touching an active function control while it is active; for example, if you were to touch it in the figure above, the Numeric Entry Panel would pop up right next to the control:

Center Frequency 2.000000000 GHz

Span 4.16000000 GHz

Swept Span / Zero Span

Start Freq -80.000000 MHz

Stop Freq 4.080000000 GHz

CF Step 416.000000 MHz (Auto / Man)

Freq Offset 0 Hz

Signal Track (Span Zoom) On / Off

Span 4.160 GHz
Sweep 6.93 ms (1001 pts)

Center Frequency

2.000000000 GHz

Center Frequency 2.000000000 GHz

Span 4.16000000 GHz

Swept Span / Zero Span

Start Freq -80.000000 MHz

Stop Freq 4.080000000 GHz

CF Step 416.000000 MHz (Auto / Man)

Freq Offset 0 Hz

Signal Track (Span Zoom) On / Off

Span 4.160 GHz
Sweep 6.93 ms (1001 pts)

You can display the Numeric Entry Panel by touching any active function control while it is active, but you don’t have to pop up the Numeric Entry Panel first, you can just start typing and it will pop up on its own, thus saving you a keystroke.

You can also adjust a value without displaying the Numeric Entry panel by turning the knob or using the step keys while an active function is active. If you turn the knob or use the step keys while the Numeric Entry Panel is displayed, it disappears, allowing you to see the entire screen while you are making the adjustment.

You can also drag the Numeric Entry Panel to another part of the display if it is covering something that you wish to see while it is on the screen.

2.4.1 Right-Click Menu

If you click with the right mouse button on any of the menus in measurements, a popup menu appears, which includes:

The items in this menu are:

- "Add to User Menu" on page 147
- "Help on this setting" on page 147
- "Show SCPI Command" on page 147
- "Add to SCPI Recorder" on page 148
- "Start/Stop SCPI Recorder" on page 148
- "Show SCPI Recorder" on page 148

2.4.1.1 Add to User Menu

For details, see "User Menu" on page 148.

2.4.1.2 Help on this setting

For details, see "Help" on page 161.

2.4.1.3 Show SCPI Command

Enabled/visible when the currently-active feature has an associated SCPI command or query. Displays a popup dialog that shows the active GUI selection’s SCPI command.

To close the popup dialog, click **OK**

2.4.1.4 Add to SCPI Recorder

Adds SCPI to the recorder from User Interface features that have equivalent SCPI.

This is the manual mode for adding SCPI to the recorder when you do not wish to add SCPI continuously. This control is enabled only when the current active feature has an associated SCPI command or query.

Irrespective of the continuous recording state, clicking this control adds the active entry into the recorder, including the active value if it is a setting.

2.4.1.5 Start/Stop SCPI Recorder

Starts or stops continuous recording mode. After starting the recording, any changes to settings will be recorded.

After continuous recording is enabled, the button label changes to **Stop SCPI Recorder**, which is displayed while recording is in progress. Clicking **Stop SCPI Recorder** halts recording and switches the control label back to **Start SCPI Recorder**.

2.4.1.6 Show SCPI Recorder

This shortcut opens the dialog "SCPI Recorder" on page 2436.

2.4.2 User Menu

Lets you create your own menu, to include controls that you frequently use. You can have one **User Menu** for each measurement, and all User Menus survive a power cycle.

You add a control to the User Menu for the current measurement by right-clicking on the control, then selecting "Add to User Menu" on page 147. You can also remove the control from the User Menu using the same right-click menu item.

User Menu appears at the bottom of the menu drop-down panel.

2.5 Cancel key

This front-panel key has the same functions as the Windows **Esc** (Escape) key. It does the following:

- Cancels dialogs
- Cancels active functions (unless there is an entry in progress, in which case it cancels that, and reverts to the previous value)
- Resets input overloads
- Aborts print operations
- Cancels certain other operations (such as alignments)
- Returns you to Local Control (if in Remote)
- If the backlight is off, turns on the backlight, and does nothing else

Most of this functionality is the same as earlier X-Series models and similar to ESA and PSA operation.

When the instrument is in Remote, any hardkey that is pressed on the front panel displays this message:

```
Analyzer is in Remote. Press ESC to return to Local
```

The exception is the **Cancel (ESC)** key, which takes the instrument out of Remote.

When the instrument is also in the LLO (local lockout state), the **Local** key is locked out as well. When this is the case, and the **Local** key is pressed, this message is displayed:

```
Local key is locked out by remote computer. Cancel Local Lockout on computer or
release remote control
```

When you see this message, you should disconnect the remote computer, or use it to take the instrument out of the Local Lockout state.

2.6 Onscreen Keyboard key

This key turns the onscreen alpha keyboard (OSK) on and off.

There are two onscreen keyboards:

- The Multitouch OSK, which pops up automatically if, while using the analyzer application, a text field becomes the active function
- The Windows OSK, which you must open manually when a text field must be entered while interacting with Windows or other apps

2.7 Touch On/Off Key

This front-panel key turns the display touch functionality on and off. If off, you can turn it back on using the front panel **Touch On/Off** key. When the touch functionality is off, you can still use a mouse as a pointer.

When toggled, a dialog box appears midscreen that confirms “Touchscreen On” or “Touchscreen Off”.

This function remains in effect until it is turned off or until the app shuts down. The app always starts up with Touch enabled.

2.8 Tab key

This key has the same function as the **Tab** key on a PC keyboard.

You can use this key to display the Windows Taskbar, as follows.

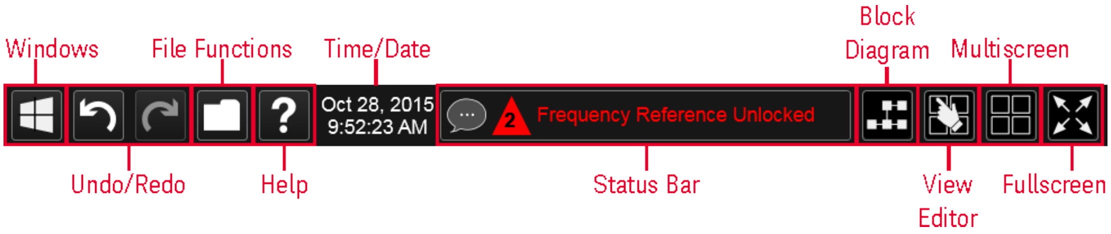
- Alt-Tab to the Desktop
- Touch the desktop
- Touch **TAB**
- The Taskbar appears

2.9 Local Button

Appears in the Menu Panel when the instrument is in remote, and can be brought back to local via the **Local (ESC)** Key. See also "Cancel key" on page 149.

2.10 Control Bar

The Control Bar contains controls and readouts that let you control instrument functions independent of the current measurement.



2.11 Windows

Pressing the Windows icon on the "Control Bar" on page 154 has the same effect as pressing the Windows icon on the Windows taskbar. It displays the Windows taskbar and Start Menu, which allows you to launch Windows programs and access features such as the Control Panel.

2.12 Undo/Redo

The Undo button in the "Control Bar" on page 154,

and the Undo front panel key,

are used to undo the most recently executed function.

If you Undo a function, and then decide you should not have done so, you can use the **Redo** button in the "Control Bar" on page 154 to put it back the way it was. The Redo function may also be executed by pressing **Ctrl+Undo** (holding the **Ctrl** key down while pressing the **Undo** font panel key).

Undo allows you to restore a setting, which you had previously set, back to its value before you changed it. When you press the Undo button or front panel key, the last setting you changed is "undone", that is, its previous setting is restored. You are notified of this fact with an advisory pop up message; for example, if the Center Frequency had been 300 MHz, and you changed it to 1 GHz and then pressed **Undo**, the message would show:

```
UNDO: Center Freq 1 GHz -> 300 MHz
```

The instrument can store 5 levels of action for Undo.

To truly understand Undo and Redo, it helps to think of two "stacks", an Undo stack and a Redo stack,

UNDO stack	REDO stack

Whenever you perform an action, it is placed on the Undo stack. So for example, if you set the Center Frequency to 1 GHz, then set the RBW to 1 MHz, then set the Detector to Peak, each of these actions gets "pushed" onto the Undo stack:

UNDO stack	REDO stack
Det = Peak	
RBW = 1MHz	
CF = 1 GHz	

When you press **Undo**, the top item on the Undo stack is removed, the action represented by that item is undone, and the item is placed on the Redo stack. So pressing **Undo** once in the above case would undo the setting of the peak detector, and the stacks would look like this:

UNDO stack	REDO stack
RBW = 1MHz	Det = Peak
CF = 1 GHz	

Now pressing **Undo** again would undo the RBW = 1 MHz action, and the stacks would look like this:

UNDO stack	REDO stack
CF = 1 GHz	RBW = 1MHz
	Det = Peak

Now pressing Redo would Redo the RBW = 1 MHz action, and the stacks would again look like this:

UNDO stack	REDO stack
RBW = 1MHz	Det = Peak
CF = 1 GHz	

Also, whenever you set a value, the Redo stack is cleared; you can’t redo an action once you have interrupted the original flow of actions. Think of the Undo stack as the past, and the Redo stack as the future; if you have items in both stacks it means you have gone back to a time in the past; if you then *do* something you have changed the future, so the old future (the Redo stack) gets cleared.

For example, in the example above, if you now were to change another setting, such as VBW = 1 kHz, the Redo stack gets cleared, and the stacks would look like this:

UNDO stack	REDO stack
VBW = 1 kHz	
RBW = 1MHz	
CF = 1 GHz	

Undo can undo changes you make with the knob or step keys, however all contiguous events that affect the same parameter are aggregated into one event for the sake of Undo. For example, if CF is the active function and is 1 GHz, and you turn the knob back and forth, then enter a value, then use the step keys, when you press **Undo**, the instrument returns to CF = 1 GHz.

Actions that Cannot be Undone

There are some actions that cannot be undone, because these clear the Undo/Redo stack:

- Restore Mode Defaults clears the stack for that Mode in that Screen
- Sending SCPI commands clears the stack for that Mode in that Screen
- Loading a state file (including User Preset) clears the stack for that Mode in that Screen
- Deleting a Screen clears all the stacks in that screen
- Changing Views

Undo/Redo works within the context of a Mode. Each Mode in each Screen keeps its own record. Settings in the Control Panel or System Settings menus are not undoable.

There are several actions that may change many parameters. Among these are Auto Tune, and Adjust Atten for Min Clipping. After executing such a function, Undo sets all parameters back to their value before the function was selected. Auto Tune appears to be a single action, even though the instrument executes it in several steps.

Redo reverses the effect of the last Undo action, assuming that no other settings have been changed since the last Undo. Changing a setting after an Undo clears memory of all settings after that Undo, that is, it clears the Redo stack, as explained above.

When you press the **Redo** icon or **Ctl** and the **Undo** hardkey, you are notified with an advisory popup message; for example, if the Center Frequency had been 300 MHz, and you changed it to 1 GHz and then pressed **Undo**, the message would say:

```
UNDO: Center Freq 1 GHz -> 300 MHz
```

If you then press **Redo**, the message will say:

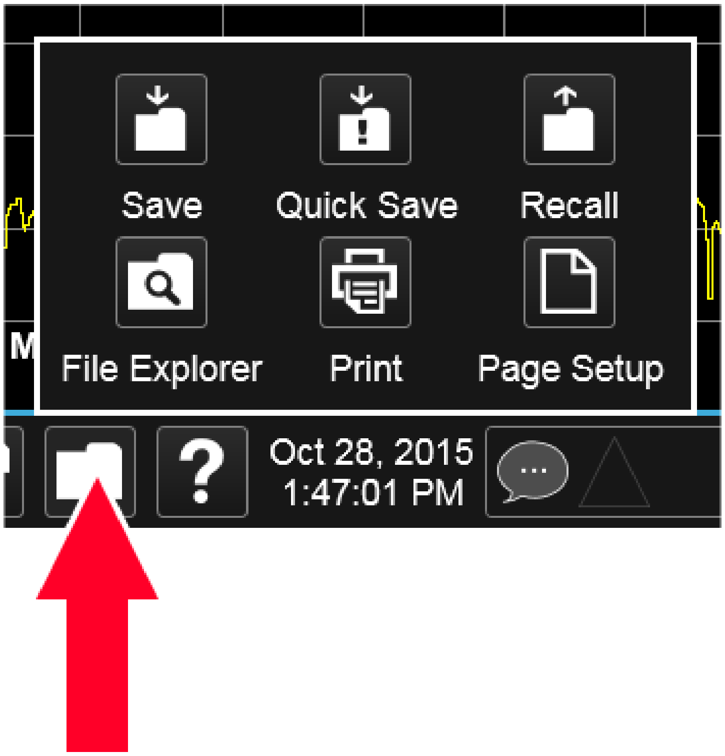
```
REDO: Center Freq 300 MHz -> 1 GHz
```

Neither **Undo** nor **Redo** perform any navigation, and have no effect on which menu panel is displayed nor which function is active.

2.13 File Functions

The File Functions popup contains controls for executing Save, Recall, File and Print operations. You display the File Functions popup by tapping the File Functions icon in the "Control Bar" on page 154.

For more information on a control, tap an icon in the image below.



Tapping this folder icon displays the File Functions popup

2.13.1 File Explorer

Pressing the File Explorer button in the "File Functions" on page 160 dialog opens the Windows File Explorer, which allows you to perform operating system file functions such as Move, Copy and Delete.

File Explorer also allows you to map network drives to drive letters on your PC or intranet, in order to more easily save screen images, states and other data, and load them back into the instrument.

2.14 Help

?

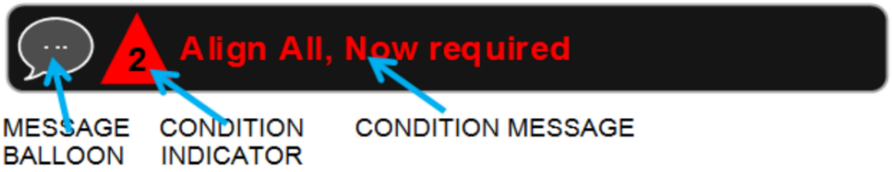
Pressing the **Help** button in the "Control Bar" on page 154, the **Help** front panel key, or the **F1** key if you have a PC keyboard connected, opens the context-sensitive help system. The **Help** button appears in the "Control Bar" on page 154 and in the banner of full-screen dialogs

You can also use the Help window's Contents pane to navigate to Help for any function in the instrument

You can also touch-and-hold a specific control to display a "right-click" menu, in which one of the choices is **Help on this setting**

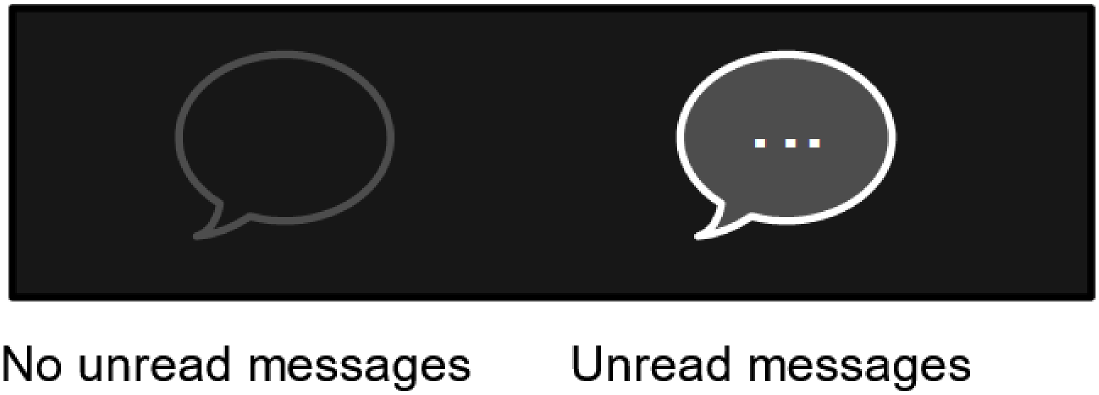
2.15 Status Bar

The Status Panel (or Status Bar) appears at the bottom of the display and contains three fields:



Align All, Now required

The Message Balloon appears on the left side of the Status Panel and lets you know when there is an unread message in the queue.



The Message Balloon has a gray outline and no fill if there are no unread messages; it has a gray fill and a white outline and displays a white ellipsis in the middle if there are unread messages.

The Condition Indicator appears to the right of the Message Balloon and shows the current number of open conditions. Below are some examples of what the Condition Indicator can look like:

The triangle is unfilled if no there are no open conditions, filled with yellow if all open conditions are warnings, and filled with red if at least one open condition is an error. The number displayed is the total number of open conditions.

Touching the Condition Indicator opens up the Show Status dialog (see below) with the Current Conditions tab selected. Touching anywhere else on the Status Bar opens up the Show Status dialog with the History tab selected.

The Condition Message appears to the right of the Condition Indicator. In the example below, the cCondition Message is “Align All, Now required”:

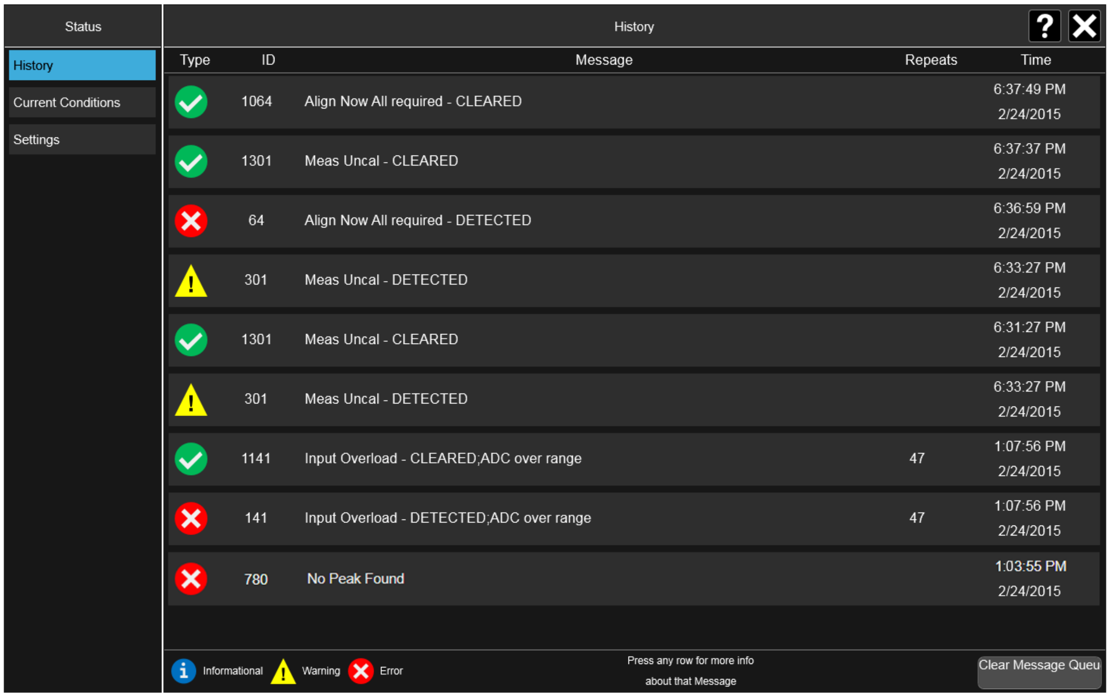
Align All, Now required

Warning condition messages display in yellow, error condition messages display in red.

If there is more than 1 open condition, the Condition Message cycles through the display of all of the open conditions, one at a time. Each message is displayed for 2 seconds, then the next for 2 seconds, and so on.

Show Status Dialog

The Show Status dialog appears if you tap anywhere in the Status Bar. Touching the Condition Indicator (the triangle in the Status Bar) opens up the Show Status dialog with the Current Conditions tab selected. Touching anywhere else on the Status Bar opens up the Show Status dialog with the History tab selected.



Type	ID	Message	Repeats	Time
✓	1064	Align Now All required - CLEARED		6:37:49 PM 2/24/2015
✓	1301	Meas Uncal - CLEARED		6:37:37 PM 2/24/2015
✗	64	Align Now All required - DETECTED		6:36:59 PM 2/24/2015
⚠	301	Meas Uncal - DETECTED		6:33:27 PM 2/24/2015
✓	1301	Meas Uncal - CLEARED		6:31:27 PM 2/24/2015
⚠	301	Meas Uncal - DETECTED		6:33:27 PM 2/24/2015
✓	1141	Input Overload - CLEARED;ADC over range	47	1:07:56 PM 2/24/2015
✗	141	Input Overload - DETECTED;ADC over range	47	1:07:56 PM 2/24/2015
✗	780	No Peak Found		1:03:55 PM 2/24/2015

If the display fills up, scrolling is enabled just as in other X-Series Multi-touch UI displays.

The Status dialog automatically refreshes as new messages and conditions occur.

At the bottom of the screen is a Clear Message Queue button. This button clears all errors in all error queues.

Note the following:

- Clear Message Queue does not affect the current status conditions
- Mode Preset does not clear the message queue
- Restore System Defaults (Super Preset) will clear all message queues
- *CLS only clears the queue if it is sent remotely and *RST does not affect any error queue
- Switching Modes does not affect any error queues

See "More Information" on page 165

Remote Command	`:SYSTem:ERRor[:NEXT]?`
Example	`:SYST:ERR?`
Notes	The return string has the format:

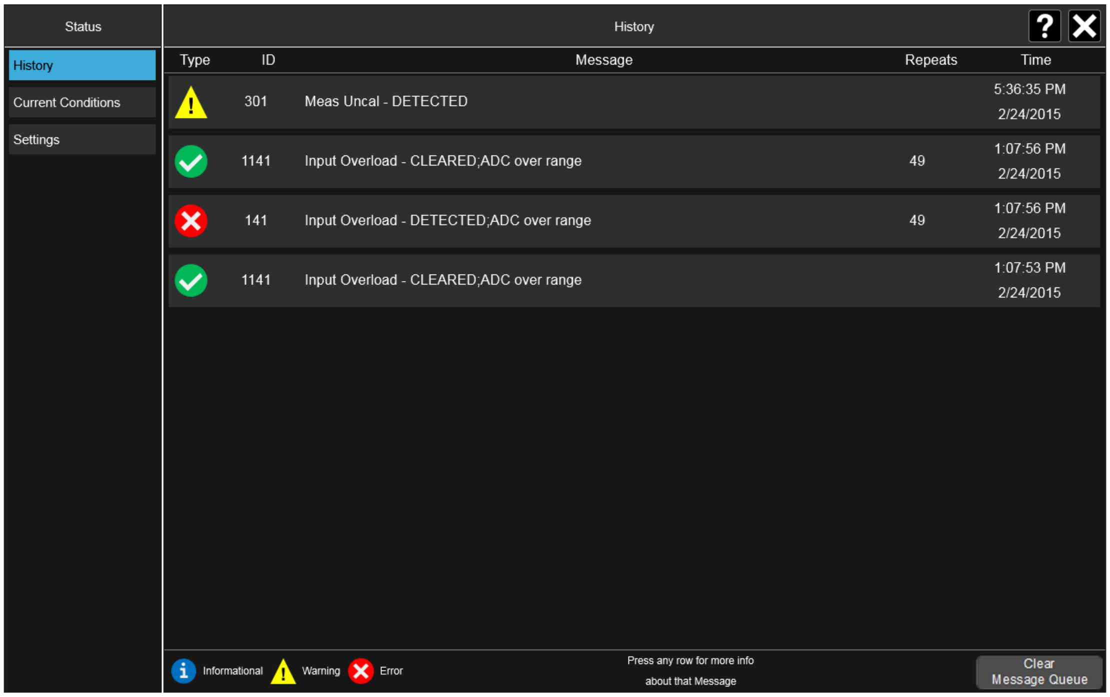
	`<Error Number>,<Error>` Where `<Error Number>` and `<Error>` are those shown on the Show Errors screen
Backwards Compatibility Notes	In some legacy analyzers, the Repeat field shows the number of times the message has repeated since the last time the error queue was cleared. In the X-Series, the Repeat field shows the number of times the error has repeated since the last intervening error. So the count may very well be different than in the past even for identical signal conditions Unlike previous analyzers, in the X-Series all errors are reported through the Message or Status lines and are logged to the event queue. They never appear as text in the graticule area (as they sometimes do in previous analyzers) and they are never displayed in the settings panel at the top of the screen (as they sometimes do, by changing color, in previous analyzers) As a consequence of the above, the user can only see one status condition (the most recently generated) without looking at the queue. In the past, at least in the Spectrum Analyzer, multiple status conditions might display on the right side of the graticule In general, there is no backwards compatibility specified or guaranteed between the error numbers in the X-Series and those of earlier products. Error, event, and status processing code in customers' software will probably need to be rewritten to work with X-Series In the legacy analyzers, some conditions report as errors and others simply turn on status bits. Conditions that report as errors often report over and over as long as the condition exists. In the X-series, all conditions report as start and stop events. Consequently, software that repeatedly queries for a condition error until it stops reporting will have to be rewritten for the X-series

More Information

The Status Dialog has two screens, selectable by the tabs on the right: **History** and **Current Conditions**:

History

History brings up a screen displaying the front panel message queue in chronological order, with the newest event at the top. Remember that the front panel queue contains all of the events generated by front panel actions as well as error events from all of the SCPI queues. A typical History display appears below:



Type	ID	Message	Repeats	Time
⚠	301	Meas Uncal - DETECTED		5:36:35 PM 2/24/2015
✓	1141	Input Overload - CLEARED;ADC over range	49	1:07:56 PM 2/24/2015
✗	141	Input Overload - DETECTED;ADC over range	49	1:07:56 PM 2/24/2015
✓	1141	Input Overload - CLEARED;ADC over range		1:07:53 PM 2/24/2015

The fields on the History display are:

Type	Displays the icon identifying the event or condition as an error or warning
ID	Displays the error number
Message	Displays the message text
Repeat (RPT)	This field shows the number of consecutive instances of the event, uninterrupted by other events. In other words, if an event occurs 5 times with no other intervening event, the value of repeat will be 5 If the value of Repeat is 1 the field does not display. If the value of Repeat is >1, the time and date shown are those of the most recent occurrence. If the value of repeat reaches 999,999 it stops there. The Repeat field can run into some pretty large numbers when apps (like the GSM app) report things like “GSM sync burst not found” as events rather than conditions, which is actually fairly common Note that the repeat count is unavailable over SCPI
Time	Shows the most recent time (including the date) at which the event occurred. Time is displayed to the second

To understand the History dialog, and to properly program the instrument’s messaging system, remember that there are two types of occurrences, events and conditions:

- An event is an occurrence of zero duration. Events generate messages which are displayed in the center of the display for a period of time and then fade away. These may be of an advisory nature or may represent errors, for example “No peak found”

- A condition is an occurrence of finite duration, that is, it has a start and an end. Conditions are states of the analyzer characterized by some combination of settings or some kind of failure that the user needs to be told about while it is happening, but then can stop being told once it goes away; for example “Input overload; ADC over range”

The error queue contains error events as well as the DETECTED and CLEARED events for condition errors, as seen in the figure above.

DETECTED events have numbers less than 1000 and CLEARED events have the same number plus 1000. For example,

301, Meas Uncal – DETECTED

and later

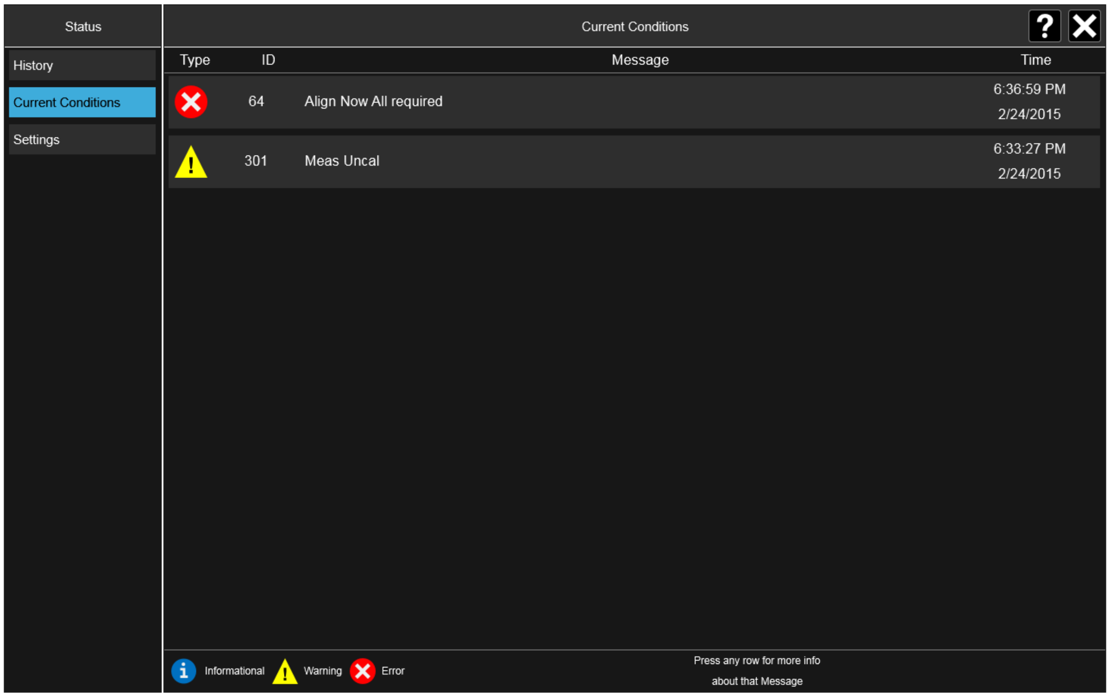
1301, Meas Uncal – CLEARED

To detect a condition error over SCPI, you should read the error queue and note any DETECTED error which is not followed eventually by an associated CLEARED error. This means the condition is still in effect. It is not sufficient to simply read the error queue until you get “No Errors” back. You may still have the condition error; the condition may still be in effect, and if that is the case, all you have done by clearing the error queue is to remove the first event (the DETECTED event) from the queue. For a condition error, you have to read the error queue until you see the CLEARED event for that condition. THEN you know that the condition is gone.

Current Conditions

The **Current Conditions** display shows all of the open conditions in the instrument. An open condition is a condition error or warning for which a start (detected) event has occurred but for which no corresponding stop (cleared) event has occurred.

An example of the Current Conditions screen appears below:



Type	ID	Message	Time
✖	64	Align Now All required	6:36:59 PM 2/24/2015
⚠	301	Meas Uncal	6:33:27 PM 2/24/2015

The fields on the Current Conditions display are:

Type	Displays the icon identifying the event or condition as an error or warning or informational
ID	Displays the error number
Message	Displays the message text
Time	Shows the most recent time (including the date) at which the event occurred. Time is displayed to the second

Touching a condition message expands the display of that message. Touching again collapses it. The description is the same as the one that appears on the message dialog. An example of this is shown in the History section, below.

When there are no open conditions, the display is as shown below:

Show Status
Current Conditions
?
X
History
Current Conditions
Settings
Type
ID
Message
Time
No Conditions Present
Informational
Warning
Error
Press any row for more info about that message

2.16 Block Diagram

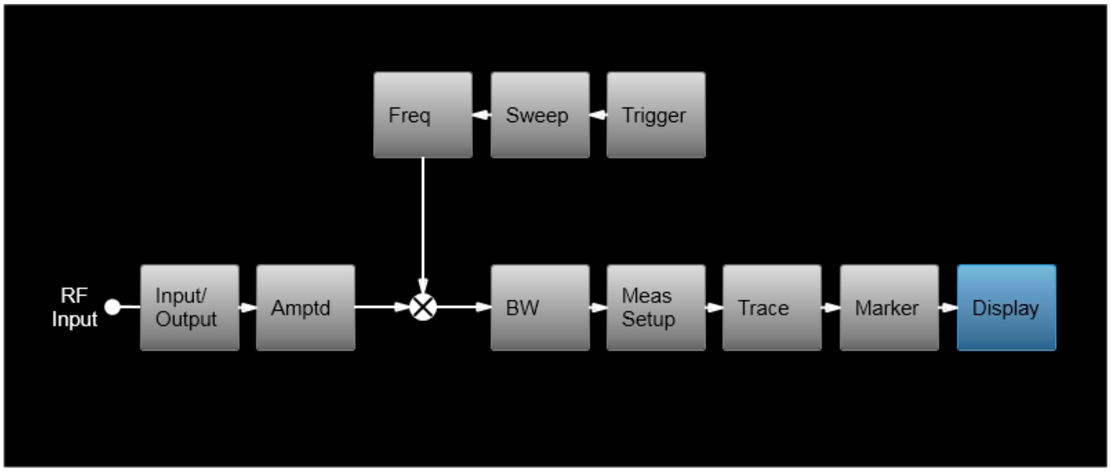
When you press the Block Diagram button in the "Control Bar" on page 154, the display changes to a stylized pictorial representation of the current internal hardware setup and signal processing path. When you touch one of the blocks on the Block Diagram, the corresponding menu panel opens.

When you press the Block Diagram button, the display changes to a stylized pictorial representation of the current internal hardware setup and signal processing path. When you touch one of the blocks on the Block Diagram, the corresponding menu panel opens.

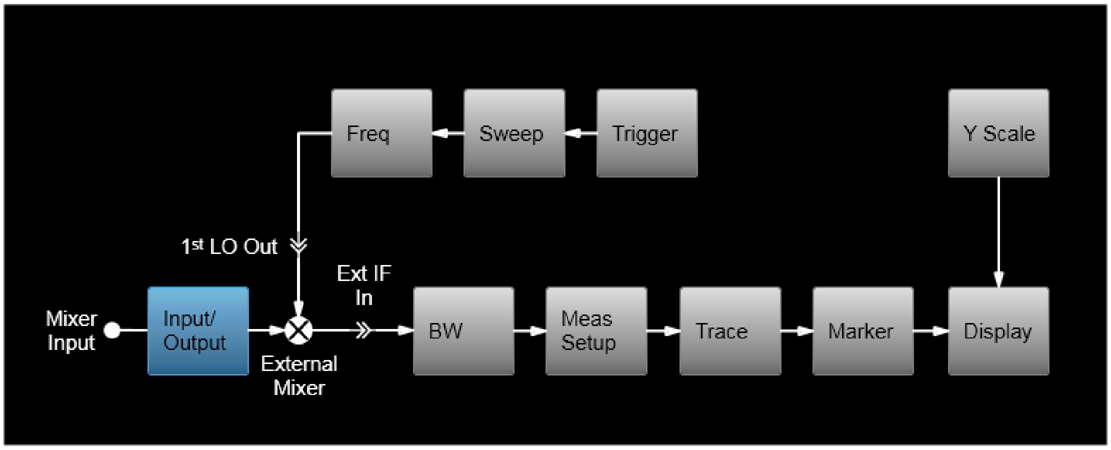
While in the Block Diagram display, the button is blue colored, as:

To exit the Block Diagram display, tap the button again.

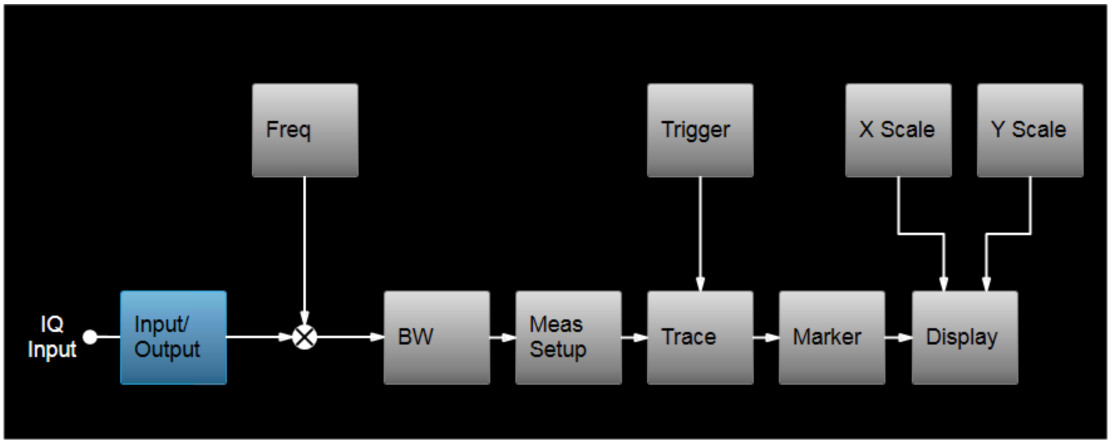
The Block Diagram display is not meant to be a completely accurate representation, but one which can show differences as you change the hardware setup. For example, here is the basic RF Block Diagram:



And here is the Block Diagram when External Mixing is selected:



And here is the Block Diagram when the I/Q inputs are selected:

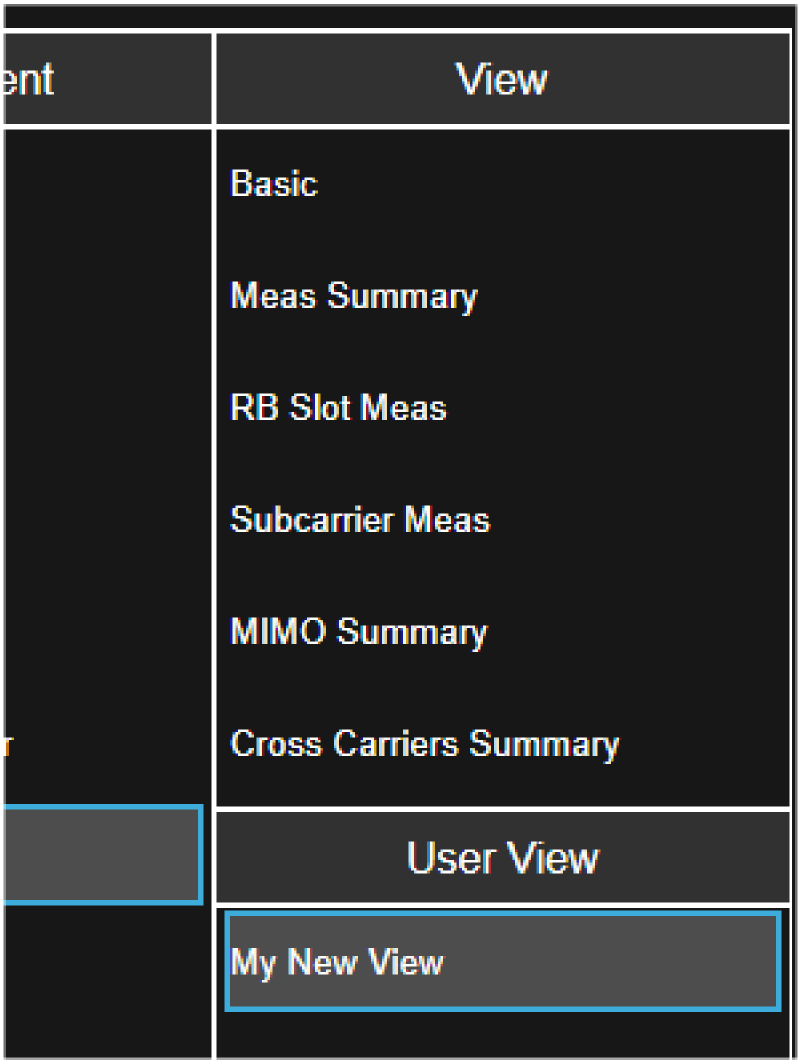


2.17 View Editor

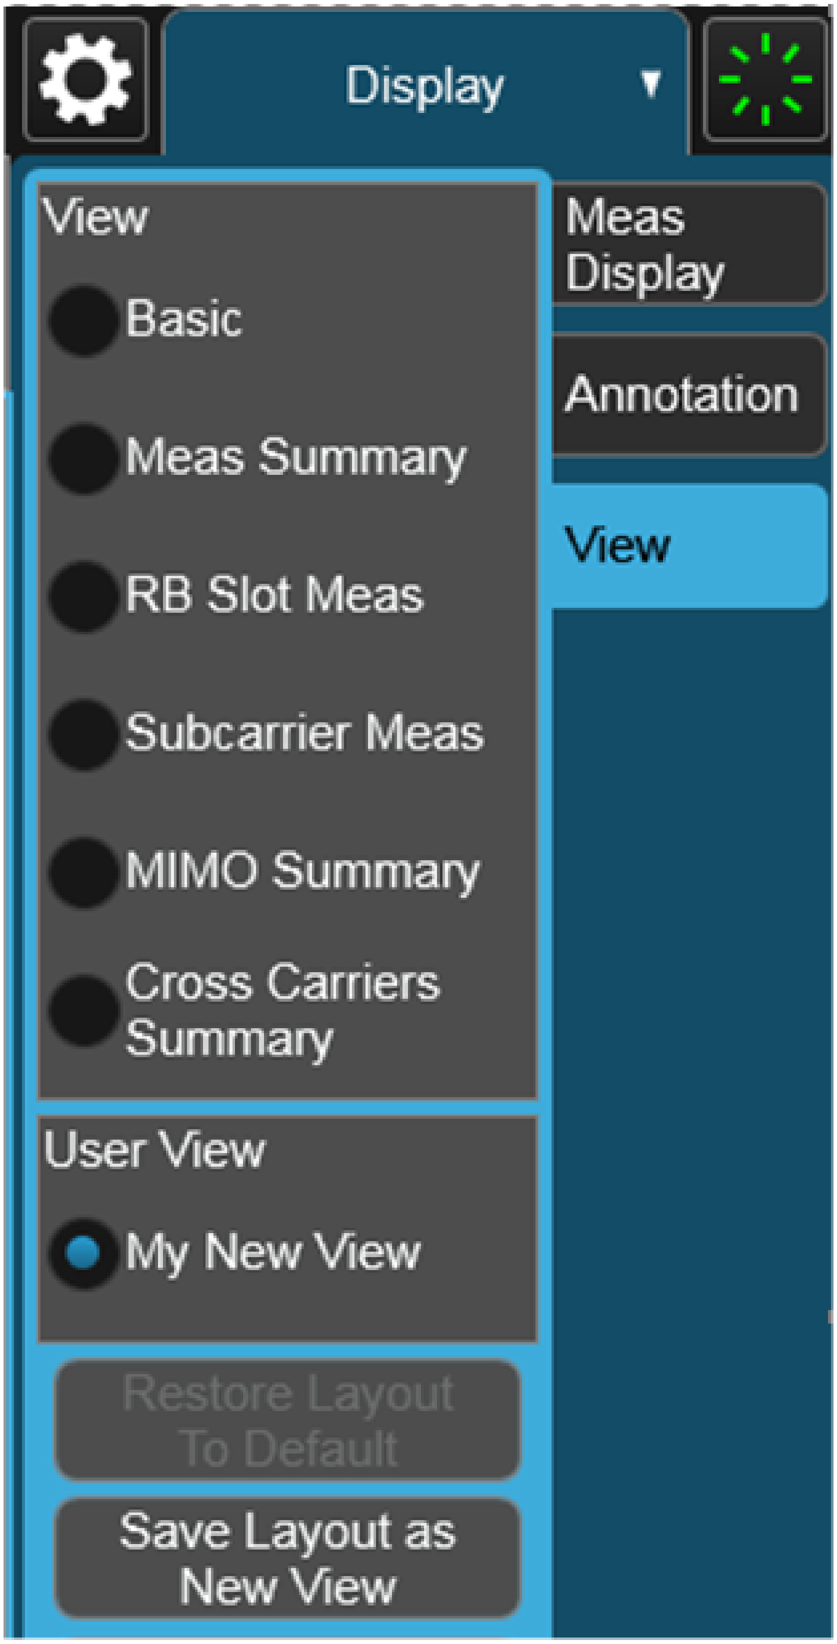
This section describes the use of the View Editor, which allows you to:

- Add windows to and delete windows from the current measurement
- Resize and rearrange windows
- Create User Views

User Views are custom Views that you create by adding, deleting, rearranging, resizing, or changing the contents of the windows in an existing View, and then saving the edited View as a new View. The instrument lists the current User Views for a measurement after the Predefined Views, in the Mode/Meas dialog and on the View menu panel under Display:



ent
View
Basic
Meas Summary
RB Slot Meas
Subcarrier Meas
MIMO Summary
Cross Carriers Summary
User View
My New View



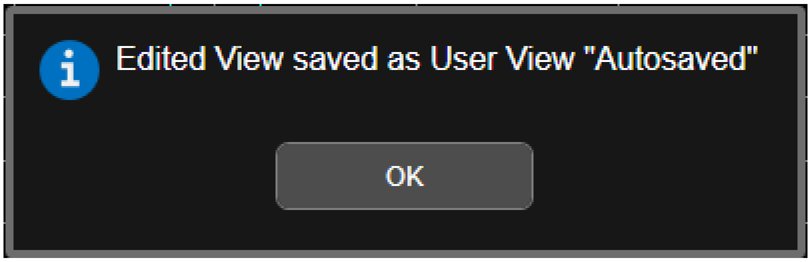
Display
View
Basic
Meas Summary
RB Slot Meas
Subcarrier Meas
MIMO Summary
Cross Carriers Summary
User View
My New View
Restore Layout To Default
Save Layout as New View
Meas Display
Annotation
View

You can save an edited View using the **Save Layout as New View** control in the View menu (see "To Save a User View" on page 185).

On occasion, the instrument may automatically save an edited View for you. If you have edited a View, so that the * is displaying next to the View name, you must save that View as a User View before you save State or switch measurements. If you forget that you have made changes to a View, then to keep from losing your edited View when you switch measurements, the instrument will save it for you. If you have an edited View that has not been saved and you try to do any of the following:

- Enter the “Save” menu
- Switch Measurements
- Switch Modes
- Switch Screens

the edited view will be saved for you with the name “Autosaved”. When this happens, you will receive the following message:



Edited View saved as User View "Autosaved"

If an Autosaved User View already exists, the User View called “Autosaved” will be overwritten with the currently edited view. If you have multiple edited views, the selected edited view will be Autosaved. If there is not an edited view selected the last selected edited view will be Autosaved.

To Open the View Editor

Pressing the View Editor button (shown above) in the "Control Bar" on page 154, at the bottom right of the screen, opens the View Editor.

While in the View Editor, the icon is blue colored, as:

Pressing the View Editor button again exits the View Editor.

To Close the View Editor

Tap the View Editor button again.

The user chooses the desired View through the use of the Mode/Meas/View dialog (see "Mode/Meas/View Dialog" on page 105) or the View menu (a tab under the **Display** key). The View menu allows the user to browse the views in the current measurement. The View menu contains a list of Predefined Views for you to use. If you wish to modify a Predefined View or create your own, new View, you use the View Editor.

User Views & Predefined Views

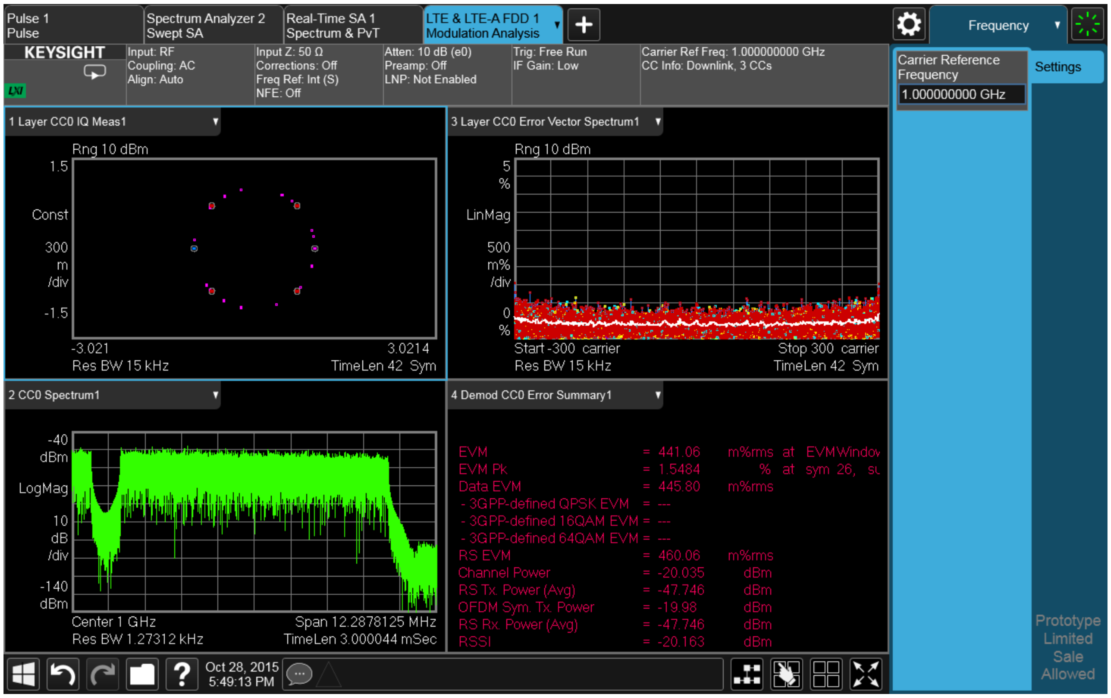
A User View is any View that is not in the list of predefined Views for the current measurement. For example, the Swept SA measurement has four predefined Views: Normal, Spectrogram, Zone Span, and Trace Zoom.

User Views allow you to add, delete, change and rearrange the windows of a predefined View, creating a new custom view.

2.17.1 To Create a User View

Whenever you add or delete a window to/from a predefined View, or change what is being displayed in a Predefined View's window, the Predefined View is marked with an asterisk (*), to show that it has been modified.

For example, to edit the View shown below, you press the Edit View icon.



Input: RF
Coupling: AC
Align: Auto

Input Z: 50 Ω
Corrections: Off
Freq Ref: Int (S)
NFE: Off

Atten: 10 dB (e0)
Preamp: Off
LNP: Not Enabled

Trig: Free Run
IF Gain: Low

Carrier Ref Freq: 1.000000000 GHz
CC Info: Downlink, 3 CCs

Carrier Reference Frequency
1.000000000 GHz

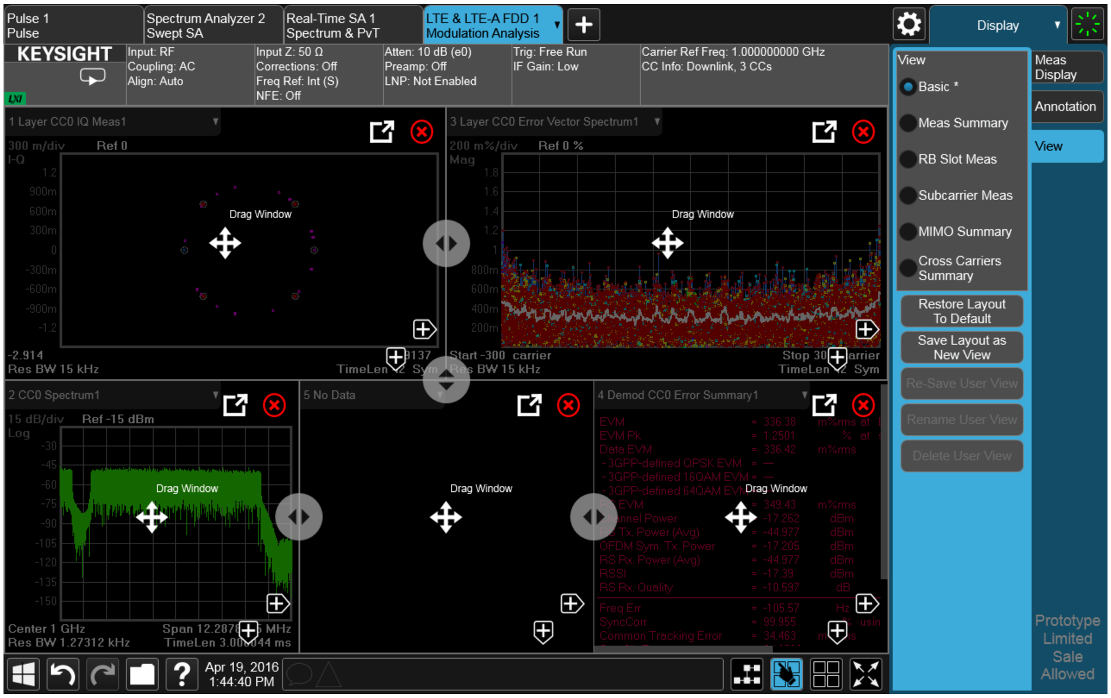
```
EVM                          =  441.06    m%rms  at  EVMWindov
EVM Pk                       =  1.5484        %  at  sym 26,  su
Data EVM                     =  445.80    m%rms
 - 3GPP-defined QPSK EVM     =  ---
 - 3GPP-defined 16QAM EVM    =  ---
 - 3GPP-defined 64QAM EVM    =  ---
RS EVM                       =  460.06    m%rms
Channel Power                =  -20.035     dBm
RS Tx. Power (Avg)           =  -47.746     dBm
OFDM Sym. Tx. Power          =  -19.98      dBm
RS Rx. Power (Avg)           =  -47.746     dBm
RSSI                         =  -20.163     dBm
```

When you do this, you get the View Editor screen, which appears as below. The menu panel switches to the View menu. Here we see that we are in the Predefined View called “Basic”.

Input: RF
Coupling: AC
Align: Auto
Input Z: 50 Ω
Corrections: Off
Freq Ref: Int (S)
NFE: Off
Atten: 10 dB (e0)
Preamp: Off
LNP: Not Enabled
Trig: Free Run
IF Gain: Low
Carrier Ref Freq: 1.000000000 GHz
CC Info: Downlink, 3 CCs

Each window has two arrows containing + signs. Pressing either of the “+” symbols adds a new window on that side. For example, let’s say you press the + symbol on the right of the lower left window:

You would then see this:



Input: RF
Coupling: AC
Align: Auto
Input Z: 50 Ω
Corrections: Off
Freq Ref: Int (S)
NFE: Off
Atten: 10 dB (e0)
Preamp: Off
LNP: Not Enabled
Trig: Free Run
IF Gain: Low
Carrier Ref Freq: 1.000000000 GHz
CC Info: Downlink, 3 CCs

A fifth window has been added, and is automatically assigned the number 5. (The window number, which is displayed in the Window Title region, is used when sending SCPI commands to that window).

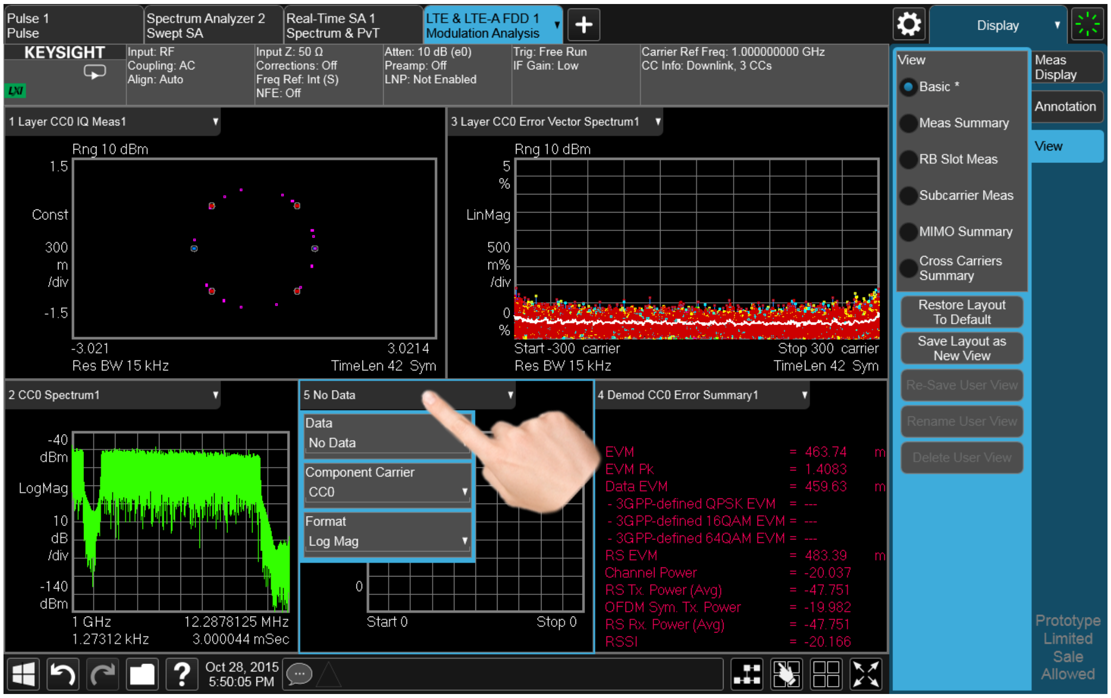
Note the * that now appears next to Basic in the View menu, indicating that you are now in the **modified** Basic View. You see the * if you add, delete or rearrange windows, but simply resizing windows does not display the *. The * means you are in a modified View, which must be saved as a User View before you leave the measurement (if you don't save it, the instrument will save it for you).

Note also that the Restore Layout to Default control is no longer grayed out. If you press this control it restores the Basic View to its default state. Restore Layout to Default becomes available when you add, delete or rearrange windows **and** when you resize them; otherwise it is grayed out.

You can add more windows with the "+" arrow symbols. Note that the "+" arrow symbols only appear if the current measurement has more windows available to display. If you are already displaying all the measurement's windows, the "+" symbols disappear.

You can exit the View Editor by again tapping the Edit View icon.

You can specify which result you want to see in the new window by tapping its title region.



Input: RF
Coupling: AC
Align: Auto

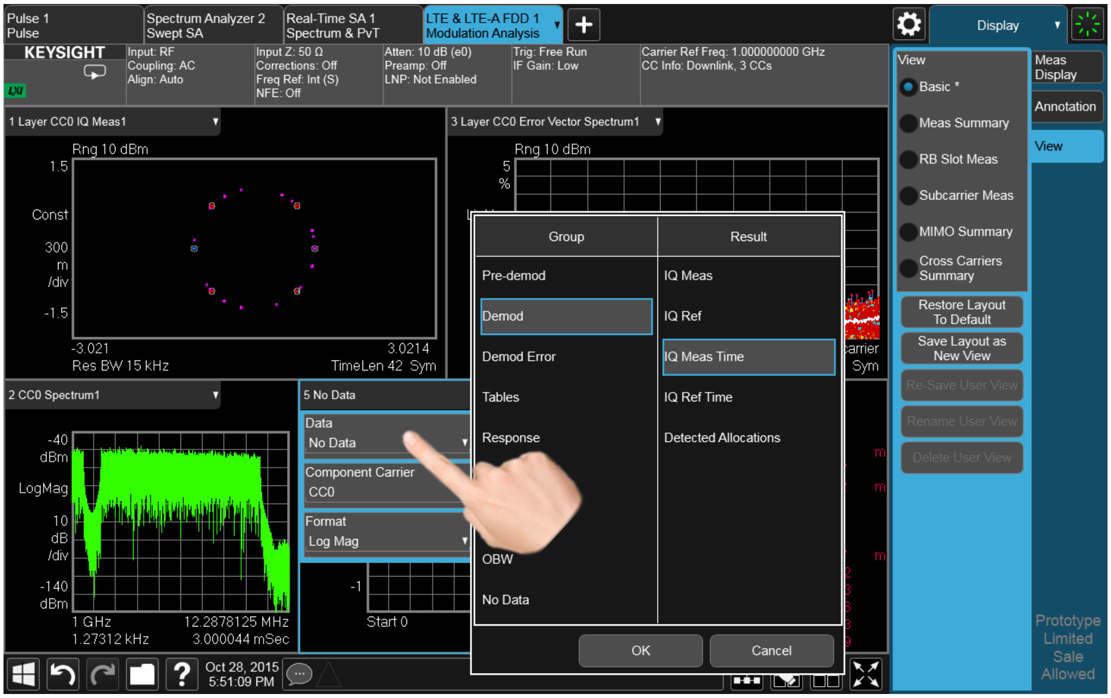
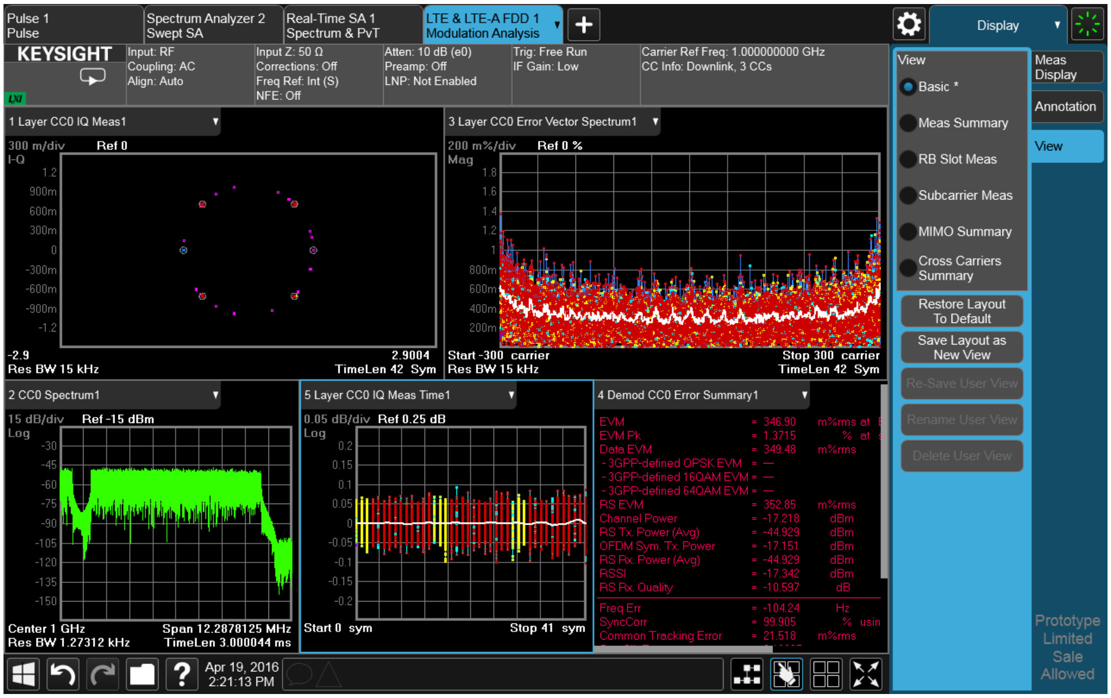
RS Tx. Power (Avg)           =  -47.751
OFDM Sym. Tx. Power          =  -19.982
RS Rx. Power (Avg)           =  -47.751
RSSI                         =  -20.166
```

A panel drops down, containing a Data control for specifying window results. Some measurements, such as LTE-A in this example, also provide controls on this dropdown for specifying other window parameters, such as the Component Carrier and Data Format, Tap the Data control and you will see a list of available results for the window. In some cases, as in LTE-A, this will be a cascading list, due to the number of results available:



Choose the result you want and tap OK. Here we have chosen IQ Meas Time from the Demod group:

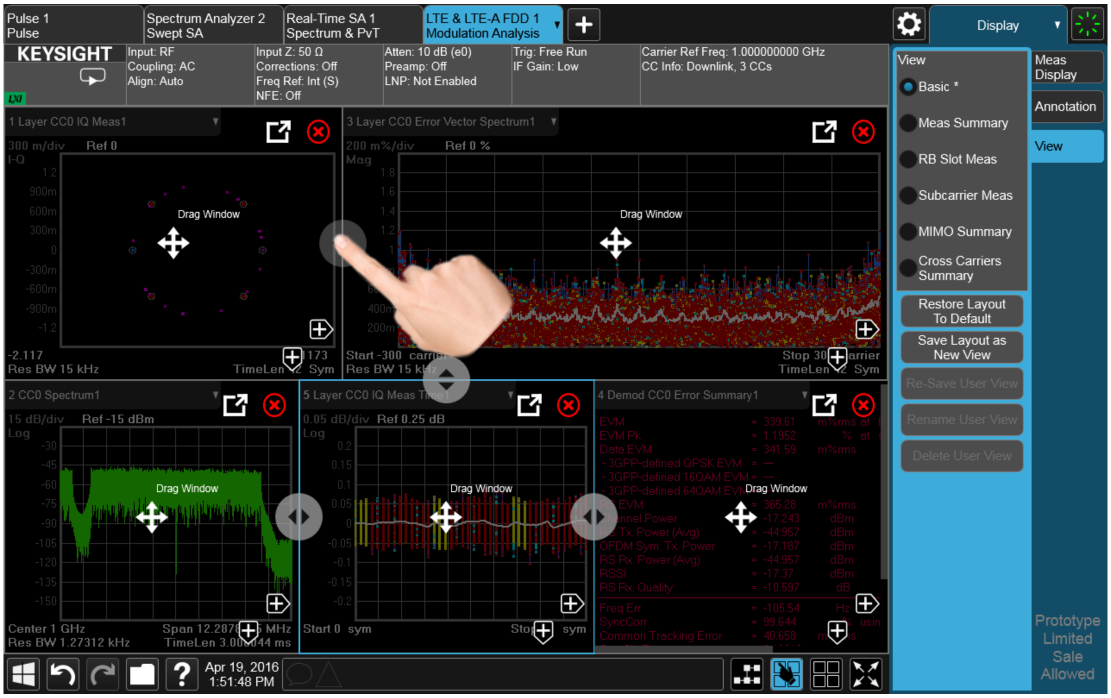


```
EVM                          = 346.90   m%rms at
EVM Pk                       = 1.3715      %  at
Data EVM                     = 349.48   m%rms
 - 3GPP-defined QPSK EVM     = —
 - 3GPP-defined 16QAM EVM    = —
 - 3GPP-defined 64QAM EVM    = —
RS EVM                       = 352.85   m%rms
Channel Power                = -17.218    dBm
RS Tx. Power (Avg)           = -44.929    dBm
OFDM Sym. Tx. Power          = -17.151    dBm
RS Rx. Power (Avg)           = -44.929    dBm
RSSI                         = -17.342    dBm
RS Rx. Quality               = -10.597    dB
Freq Err                     = -104.24    Hz
SyncCorr                     = 99.905      %  usin
Common Tracking Error        = 21.518   m%rms
```

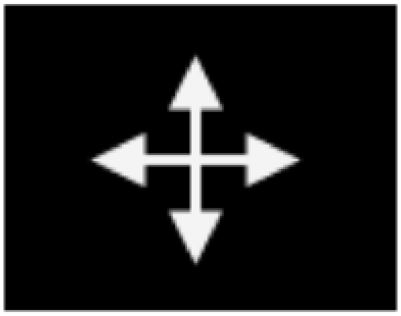
Your new, edited User View is now ready to use.

2.17.2 To Resize or Rearrange Windows in a View

Sometimes you may wish to resize a window. To do this go back into the View Editor and note the large, translucent white circles along the edges of the draggable borders. These are the “resize handles”. You can resize the windows by dragging these handles. Note that in their quiescent state they are slightly translucent; when you touch one it turns solid white, indicating that it is draggable. If you touch and drag one of them it moves the axis to which it is attached.



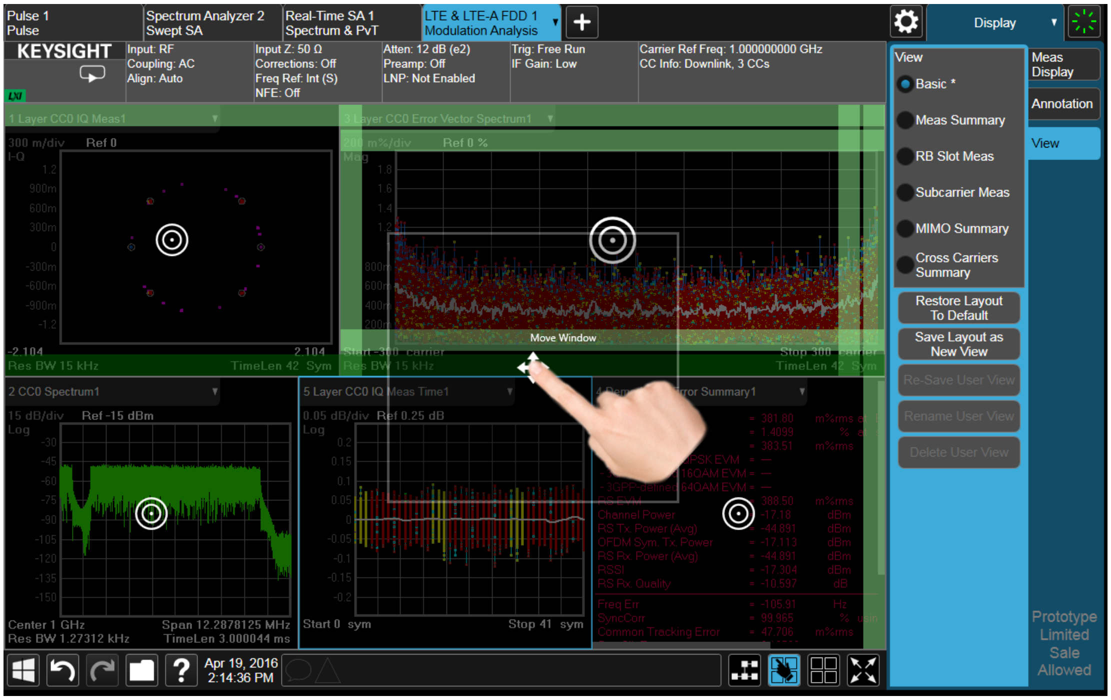
Another feature that comes with the View Editor is the ability to move windows around. You do this by dragging the four-arrow objects in the center of the window; the whole window goes along. Actually you can touch and drag anywhere in the window (except on one of the arrows or the delete circle) and it will drag, but the four-arrow objects give you an indication and a convenient finger target.



The outline of the window appears as it is being dragged. When you start to drag a window, target symbols appear in the other windows:

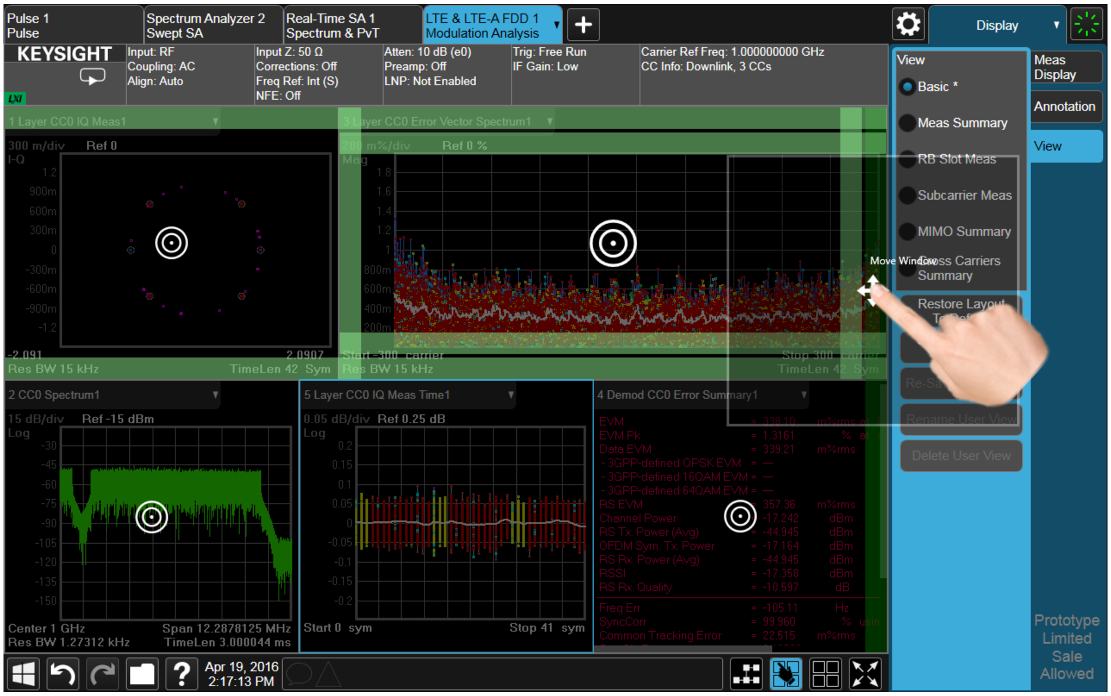
Input: RF
Coupling: AC
Align: Auto
Input Z: 50 Ω
Corrections: Off
Freq Ref: Int (S)
NFE: Off
Atten: 10 dB (e0)
Preamp: Off
LNP: Not Enabled
Trig: Free Run
IF Gain: Low
Carrier Ref Freq: 1.000000000 GHz
CC Info: Downlink, 3 CCs

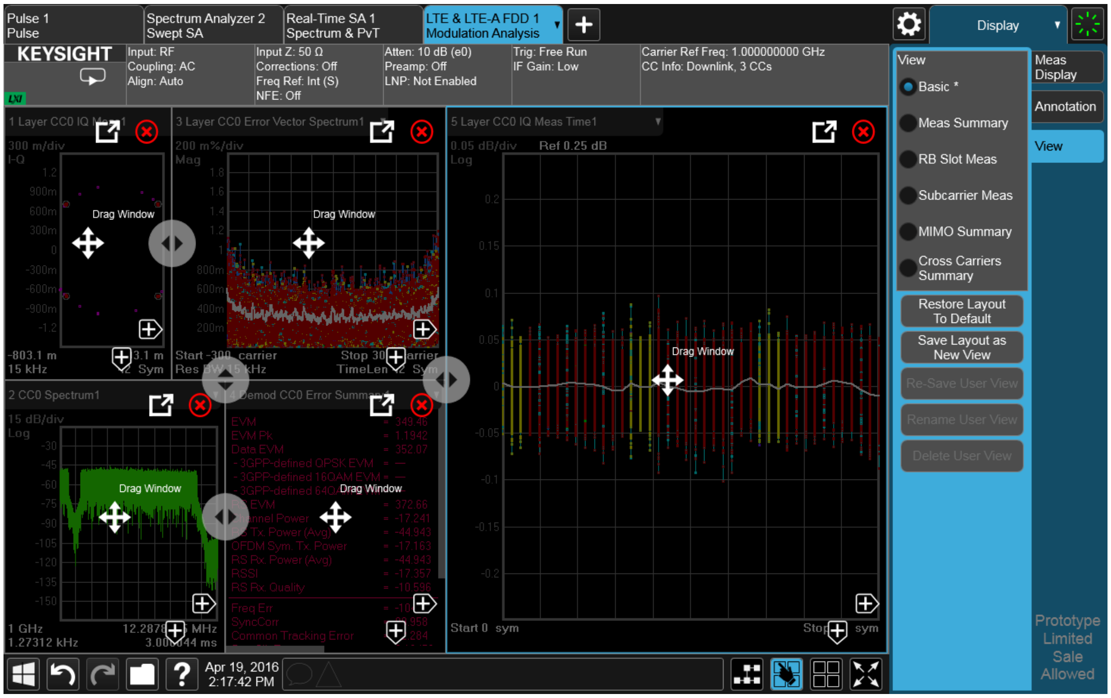
If you drop a window on one of the targets, it swaps positions with the target window. If you drag a window's center into another window, green stripes appear on the edges to show you where the window will go when you release it:



Input: RF
Coupling: AC
Align: Auto
Input Z: 50 Ω
Corrections: Off
Freq Ref: Int (S)
NFE: Off
Atten: 12 dB (e2)
Preamp: Off
LNP: Not Enabled
Trig: Free Run
IF Gain: Low
Carrier Ref Freq: 1.000000000 GHz
CC Info: Downlink, 3 CCs

When you hover over one of the stripes it gets dimmer, to show the position the window being dragged will take on. If you release a window over an inner stripe, the window you are dragging and the window over which you were hovering resize to share the space the target window originally occupied. If you release a window over an outer stripe, as shown below, the window you are dragging takes on a new position outside the array of other windows:



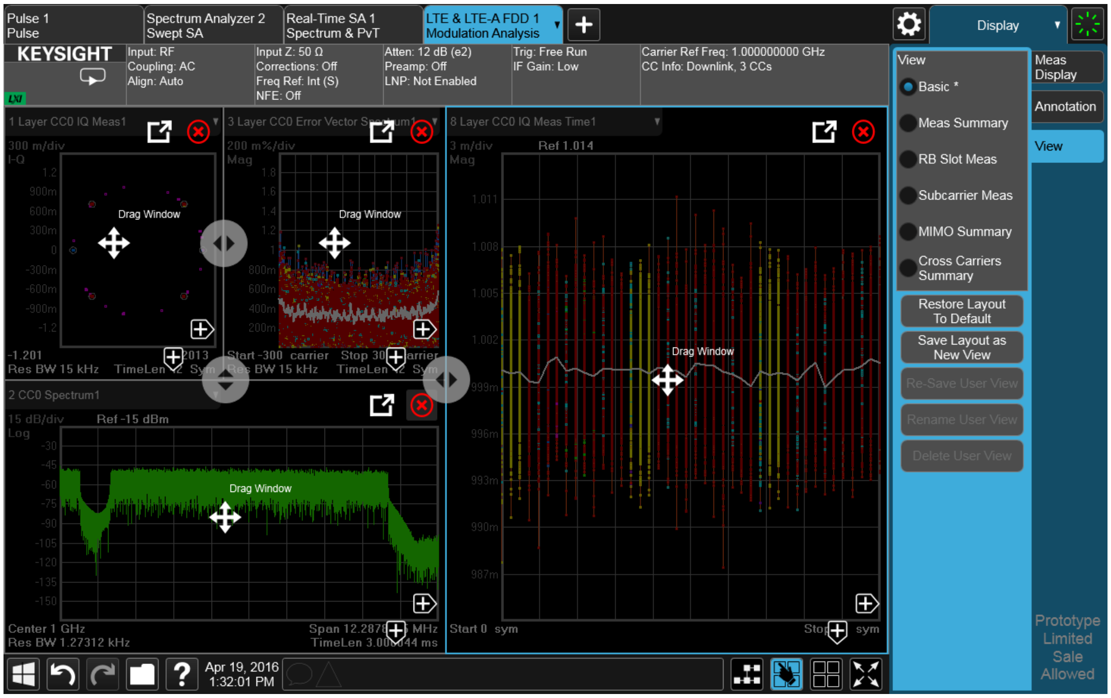


In either case, one or more of the remaining windows resize to occupy the space formerly occupied by the window you were dragging.

2.17.3 To Delete a Window from a View

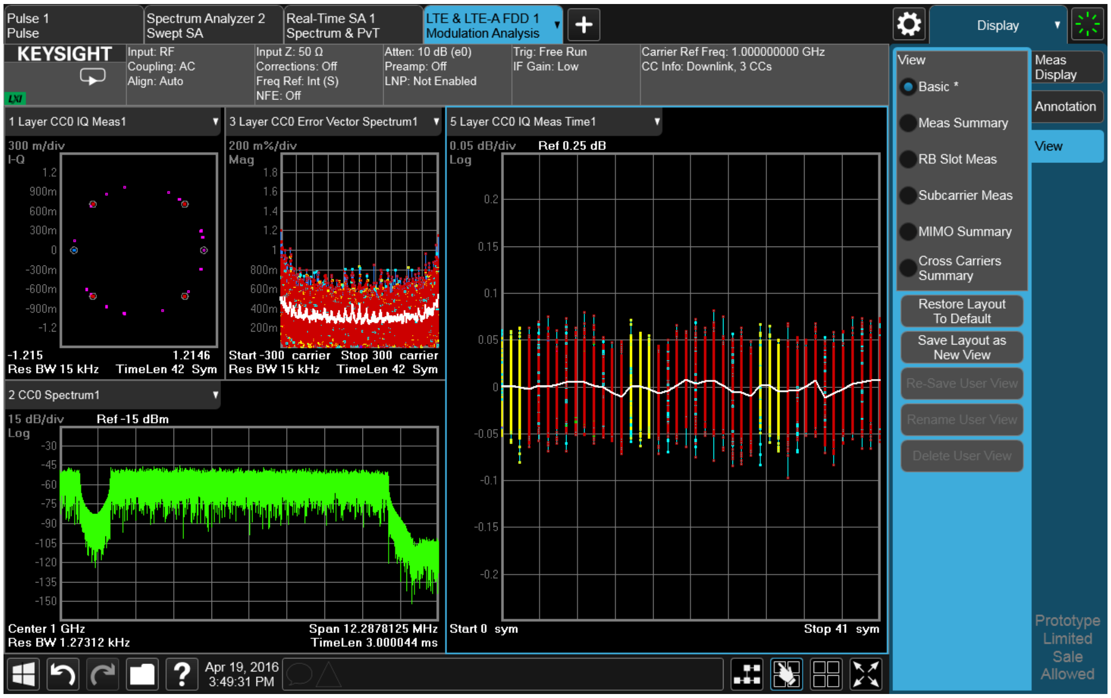
The View Editor also lets you delete a window. To do this, tap one of the circled red X's, as shown below.

There has to be more than one window for you to see the circled red Xs.



Input: RF
Coupling: AC
Align: Auto
Input Z: 50 Ω
Corrections: Off
Freq Ref: Int (S)
NFE: Off
Atten: 12 dB (e2)
Preamp: Off
LNP: Not Enabled
Trig: Free Run
IF Gain: Low
Carrier Ref Freq: 1.000000000 GHz
CC Info: Downlink, 3 CCs

Now press the View Editor button (the blue hand) to exit the View Editor. At this point, you have an edited Predefined View, as shown by the * next to Basic:



Input: RF
Coupling: AC
Align: Auto
Input Z: 50 Ω
Corrections: Off
Freq Ref: Int (S)
NFE: Off
Atten: 10 dB (e0)
Preamp: Off
LNP: Not Enabled
Trig: Free Run
IF Gain: Low
Carrier Ref Freq: 1.000000000 GHz
CC Info: Downlink, 3 CCs

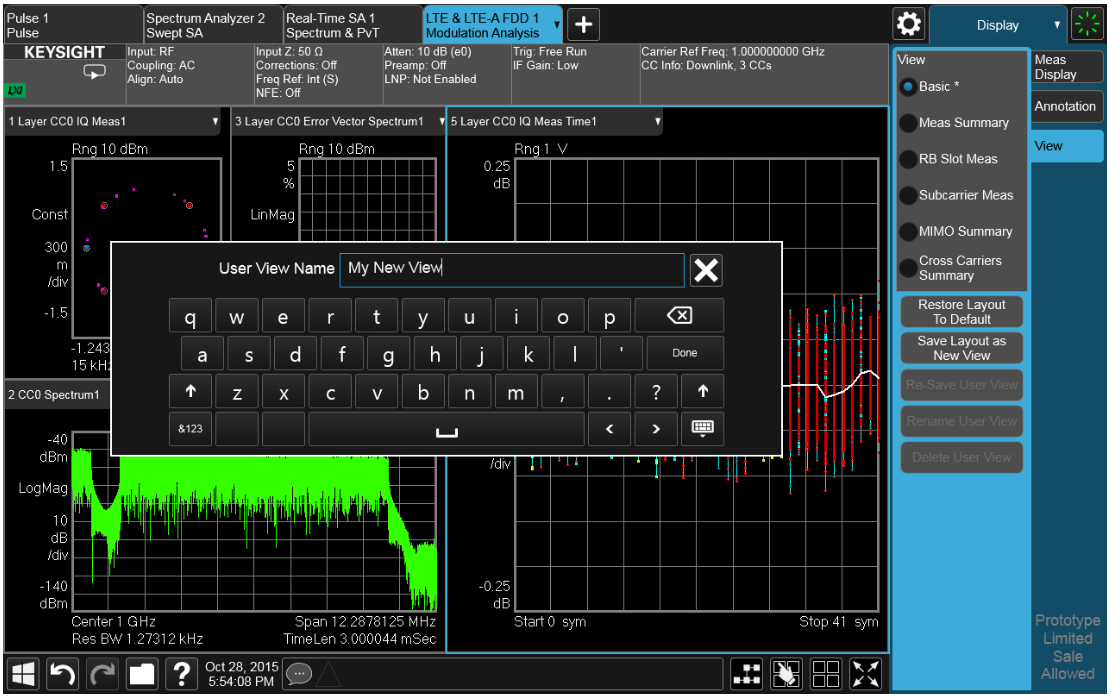
When you are finished with it, you can restore the Layout to the default for Basic by pressing “Restore Layout to Default”. Or you can save your edited View as a “User View” (if you exit the measurement without saving the edited View, the instrument will save it for you as a User View called “Autosaved”).

If you clone the current Screen by pressing the “+” tab, the modified Predefined View will be saved as a User View called “Autosaved”, and it will be available in the new Screen.

2.17.4 To Save a User View

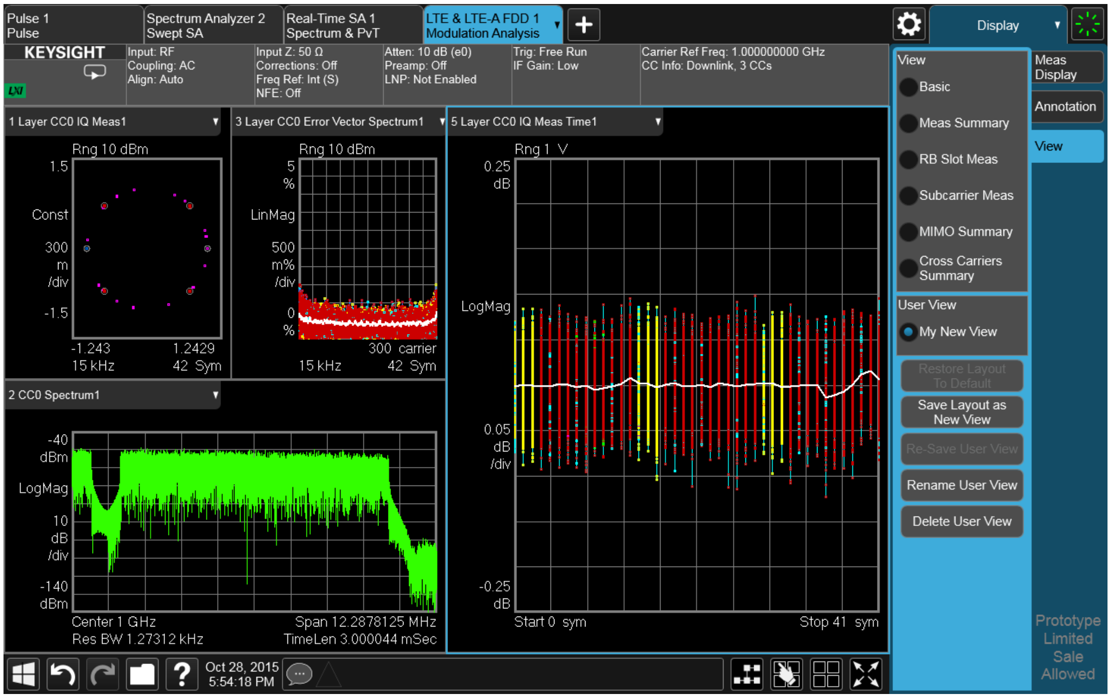
See also "Transferring User Views Between Instruments" on page 187

To save your new View as a User View, tap the “Save Layout as New View” control. You will get an alpha keyboard that lets you name your new View; the default is the old View name with a number. Below, we have typed in “My New View”:



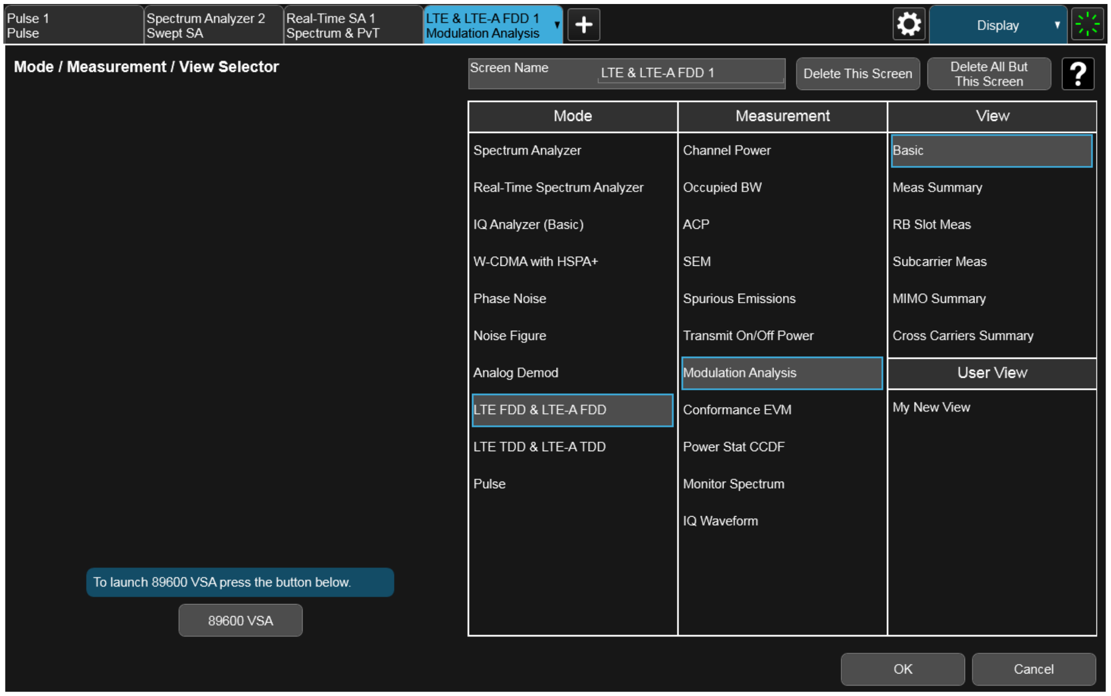
User View Name: My New View

When you tap “Done”, the View is saved:



Notice the User View region which has appeared on the menu panel above, with the new User View called “My New View. Notice also that “Basic” has returned to its original, unedited state and the * is gone from its name. Note also that “Restore

Layout to Default” is grayed out. Note also that if you go to the Mode/Meas dialog, you will see the User View there as well:



Screen Name: LTE & LTE-A FDD 1

To launch 89600 VSA press the button below.

When naming a new View, you must choose a name that is not already in use for any User View in any measurement; this is because User Views get written to permanent memory and are available to all instances of the Measurement in any screen. They survive a Mode Preset and also survive shutdown and restart of the application.

Transferring User Views Between Instruments

To transfer a User View to another instrument, you must copy the desired file to a portable drive or to your network and then copy it to the target instrument.

When you save a User View, a file is created (or updated if it already exists) containing all the User Views for the current measurement. All of these files are saved on the D: drive in the instrument, in the folder:

`D:\Users\Instrument\My Documents\UserViews`

(assuming you are logged in as Instrument, which is the default).

Look for the file for your measurement. The file naming convention is:

`ModeName.MeasName.layout`

Where `ModeName` is the long-form SCPI parameter for the `:INST:SEL` command for your Mode, and `MeasName` is the long-form SCPI parameter for the `:CONF` command for your Measurement.

For a full list of all `ModeName` parameters, see **Index to Modes** in "Mode" on page 106.

The following is a full list of all `MeasName` parameters.

Measurement Name	SCPI ID
ACP, Adjacent Channel Power	`ACPower`
AM	`AM`
AM Depth	`AMD`
Amplitude Probability Distribution	`APD`
Audio Distortion	`AUDDist`
Audio Frequency	`AUDFreq`
Audio Level	`AUDLevel`
Audio SINAD	`AUDSinad`
Automatic Direction Finder	`ADF`
Channel Power	`CHPower`
Code Domain	`CDPower`
Combined GSM	`CGSM`
Combined WCDMA	`CWCDma`
Complex Spectrum	`SPECtrum`
Conformance EVM	`CEVM`
Custom OFDM	`OFDM`
Digital Demod	`DDEMod`
Disturbance Analyzer	`DANalyzer`
EDR In-band Spurious Emissions	`IBSPurious`
EVM	`EEVM`
Fast Capture	`FCAPture`
Fast Spectrum	`FSPectrum`
FM	`FM`
FM Deviation	`FMDeviation`
FM Stereo	`FMStereo`
Frequency Counter	`FCOunter`
Frequency Scan	`FSCan`
GMSK Phase & Freq Error	`PFERror`
Group Delay	`GDELay`
Harmonics	`HARMonics`
HRP UWB Demodulation	`HUWB`
Instrument Landing System	`ILS`

Measurement Name	SCPI ID
IQ Waveform	`WAVeform`
LE In-band Emissions	`IBEMissions`
List Power Step	`LPSTep`
List Sequencer	`LSEQuencer`
List Sweep	`LIST`
Log Plot	`LPLot`
LoRa (CSS) Demodulation	`LORA`
Marker Beacon	`MBE`
Mod Accuracy	`RHO`
Modulation Analysis	`EVM`
Modulation Distortion	`MODDist`
Modulation Rate	`MODRate`
Modulation SINAD	`MODSinad`
Monitor Spectrum	`MONitor`
Noise Figure	`NFIGure`
Occupied BW / Output Spectrum BW	`OBWidth`
Output RF Spectrum	`EORFspectr`
Phase and Amplitude vs Time	`PAVTime`
PM	`PM`
PM Deviation	`PMDeviation`
Power Amplifier	`PAMPlifier`
Power Control	`PCONtrol`
Power Stat CCDF	`PSTatistic`
Power vs Time	`EPVTime`
Pulse	`PULSe`
QPSK EVM	`EVMQpsk`
Real Time Scan	`RTSC`
RF Power	`RFPower`
SEM	`SEMask`
Spectral Flatness	`FLATness`
Spectrum & PvT	`RTSA`
Spot Frequency	`SFRequency`
Spurious Emissions	`SPURious`
Streaming	`STReaming`

Measurement Name	SCPI ID
Strip Chart	`SCHart`
Swept SA	`SANalyzer`
TOI	`TOI`
Transmit Analysis	`TX`
Transmit On/Off Power	`PVTime`
Transmit Power (Burst Power)	`TXPower`
Tuned RF Level	`TRFLevel`
Tuned RF Level with Tracking	`TTRF`
Tx Band Spur	`ETSPur`
VHF Omni-Directional Range	`VOR`

Examples:

- The User View file for the Swept SA measurement is `SA.SANalyzer.layout`
- The User View file for the ACP measurement in the WCDMA mode is `WCDMA.ACPower.layout`

Copy the desired file to a thumb drive or to your network. Then go to the target instrument and copy the file into the `D:\Users\Instrument\My Documents\UserViews` directory on that instrument (again, assuming you are logged in as Instrument).

Note that copying this file to another instrument will overwrite the file already in that instrument, if any, and will destroy any User Views that might have been created on that instrument.

Note that when you delete the last User View for a measurement, the file is removed.

2.17.5 To Rename a User View

You can rename a User View by selecting that View and tapping “Rename User View.” You can also re-edit a User View; if you do this, an asterisk will appear next to the User View’s name. You can then tap “Re-Save User View to save it back to its existing name, or “Save Layout as New View” to add another, new User View.

2.17.6 To Delete a User View

You can delete a User View by doing the following:

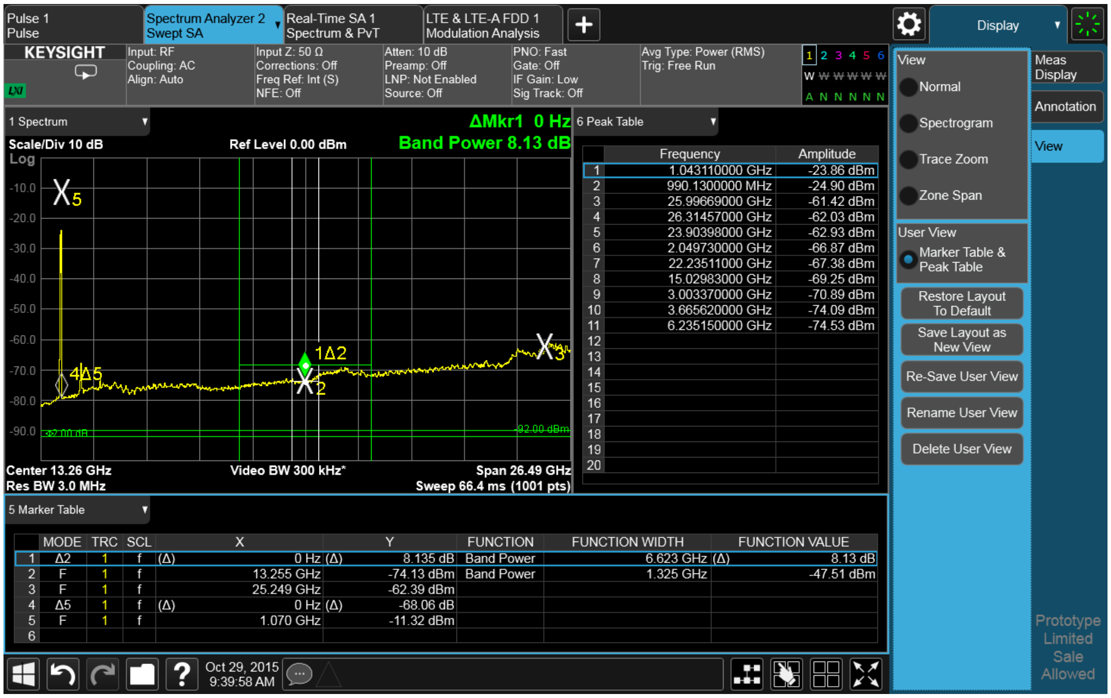
1. From the "Mode/Meas/View Dialog" on page 105, *or* from the **View** menu, select the User View that you want to delete
2. Switch to the **Display** menu
3. Select the **View** tab
4. Tap **Delete User View**

2.17.7 To Delete All User Views

You can delete all User Views by tapping “Delete All User Views.” The default view becomes the current view for the Measurement if a User View was the current view when this control was pressed.

2.17.8 Use Case: Displaying Marker and Peak Tables

One common application for User Views is to create a View that allows the Spectrum Analyzer to display both a Marker Table and a Peak Table at the same time. To do this, simply add a Marker Table Window and a Peak Table window to the Spectrum window of the Swept SA measurement. The result is shown below; note that the new View has been named “Marker Table & Peak Table”:



Input: RF
Coupling: AC
Align: Auto
Input Z: 50 Ω
Corrections: Off
Freq Ref: Int (S)
NFE: Off
Atten: 10 dB
Preamp: Off
LNP: Not Enabled
Source: Off
PNO: Fast
Gate: Off
IF Gain: Low
Sig Track: Off
Avg Type: Power (RMS)
Trig: Free Run

ΔMkr1 0 Hz
Band Power 8.13 dB
Scale/Div 10 dB
Ref Level 0.00 dBm
Center 13.26 GHz
Res BW 3.0 MHz
Video BW 300 kHz*
Span 26.49 GHz
Sweep 66.4 ms (1001 pts)

	Frequency	Amplitude
1	1.043110000 GHz	-23.86 dBm
2	990.1300000 MHz	-24.90 dBm
3	25.99669000 GHz	-61.42 dBm
4	26.31457000 GHz	-62.03 dBm
5	23.90398000 GHz	-62.93 dBm
6	2.049730000 GHz	-66.87 dBm

	MODE	TRC	SCL	X	Y	FUNCTION	FUNCTION WIDTH	FUNCTION VALUE
1	Δ2	1	f	(Δ) 0 Hz	(Δ) 8.135 dB	Band Power	6.623 GHz	(Δ) 8.13 dB
2	F	1	f	13.255 GHz	-74.13 dBm	Band Power	1.325 GHz	-47.51 dBm
3	F	1	f	25.249 GHz	-62.39 dBm			
4	Δ5	1	f	(Δ) 0 Hz	(Δ) -68.06 dB			
5	F	1	f	1.070 GHz	-11.32 dBm			
6								

NOTE: There are legacy displays like Marker Table, Peak Table, Measure at Marker and Gate View, which are not Views but special display modes. These are retained for backwards compatibility, however they are turned on and off with switches and do not use the View system. Turning on one of these switches does not create a modified View, it merely adds the specified window to the current View; turning the switch back off removes the window. While the switch is on, NO View shows as selected in the View menu. These switches are grayed out if you are in a modified View or a User View. Since only one of these switches can be on at a time, and because these switches turn off on a Preset, User Views offer a superior way of adding windows than using the switches.

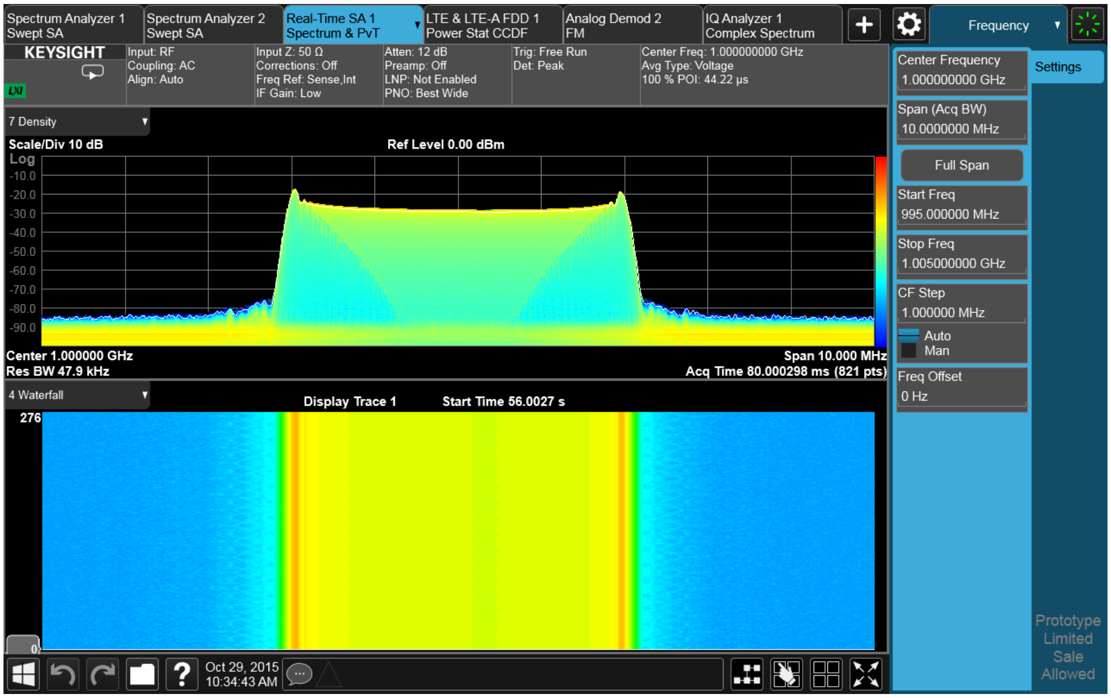
Some measurements do not support User Views; these do not allow adding, deleting or rearranging windows, however they do allow resizing windows. In these measurements you can get into the View Editor but the Add icons, Delete icons and Move icons will not appear. You can still resize the windows and in some cases (e.g. Noise Figure) you can still change window contents.

2.17.9 View Editor Remote Commands

Remote Commands for User Views can be found in the documentation for the **Display, View** tab.

2.18 Multiscreen

You can configure up to 16 different Screens at a time. Normally, you only see one Screen, and the set of configured screens is shown across the top of the display in a series of "Screen Tabs" on page 104. Touching any screen’s tab brings it to the foreground, makes it the current Screen and starts it updating.



Input: RF
Coupling: AC
Align: Auto
Input Z: 50 Ω
Corrections: Off
Freq Ref: Sense,Int
IF Gain: Low
Atten: 12 dB
Preamp: Off
LNP: Not Enabled
PNO: Best Wide
Trig: Free Run
Det: Peak
Center Freq: 1.000000000 GHz
Avg Type: Voltage
100 % POI: 44.22 µs

Scale/Div 10 dB
Ref Level 0.00 dBm
Center 1.000000 GHz
Res BW 47.9 kHz
Span 10.000 MHz
Acq Time 80.000298 ms (821 pts)
Display Trace 1
Start Time 56.0027 s

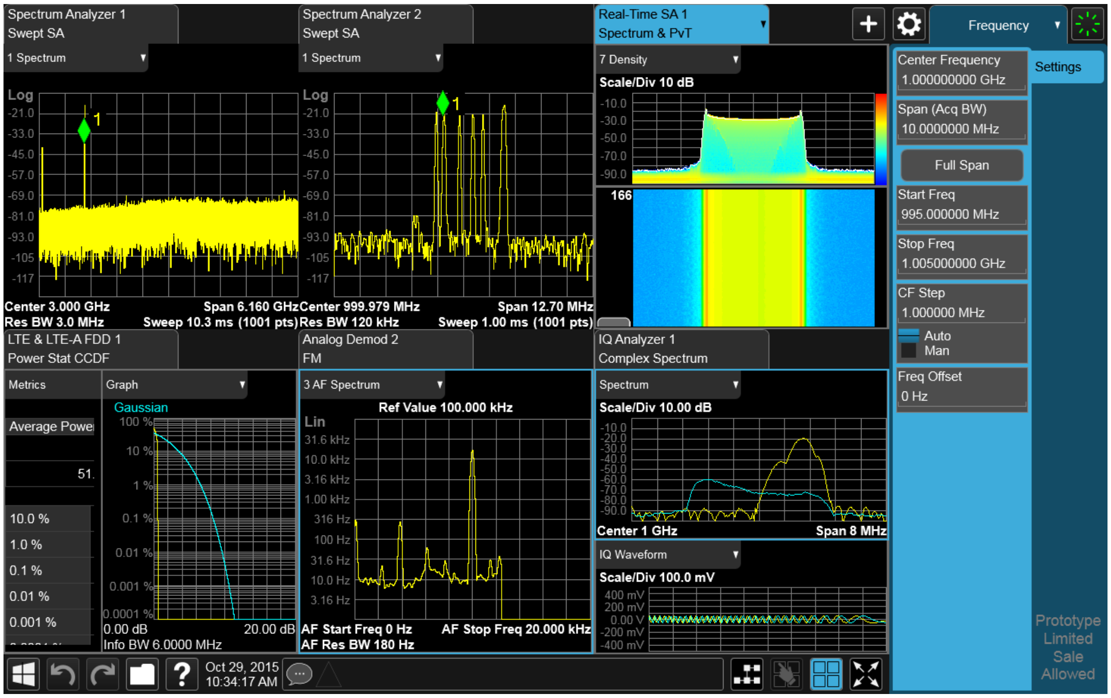
Center Frequency
1.000000000 GHz
Span (Acq BW)
10.0000000 MHz
Start Freq
995.000000 MHz
Stop Freq
1.005000000 GHz
CF Step
1.000000 MHz
Freq Offset
0 Hz

Multiscreen view lets you display all of the configured Screens at once.

You can switch to Multiscreen View by pressing this button in the "Control Bar" on page 154 at the bottom right of the screen:

⊞

Multiscreen View looks like this:



While in Multiscreen View, the button changes from a black background to a blue background:

To exit Multiscreen view, tap the button again.

Multiscreen View cannot be activated if only one screen is configured.

Each Screen contains one Mode, each Mode contains one Measurement, and each Measurement contains a number of Windows arranged in Views. You can configure multiple instances of the same Mode along with any combination of other Modes.

In Multiscreen View, just as in Single Screen View, only one screen is active.

You switch Screens by tapping the Screen Tab you want, or when in Multiscreen View, you can tap the Screen itself. When you switch Screens, the current Screen’s state and measurement results are preserved, the new Screen’s previous state and data are loaded, and the new Screen starts running its Mode.

In Multiscreen View:

– The Meas Bar does not display

– The Screens are presented in an array of equal size boxes, except where the number of Screens means some have to be different sizes (as when you have 3 Screens, 5 Screens, etc.).

- Each Screen has a tab that contains the name of the Mode and Measurement in the box and a number associated with the instance of that Mode. You can enter a custom Screen name that replaces the Mode name, by going into the Mode/Meas dialog
- There is always one and only one selected Screen. It is indicated by a blue tab. Only the selected Screen is actually running a measurement and updating its display
- The selected window in the selected screen is the context for the current menus. It is the only window on the display with a blue border
- As you go from screen to screen, each screen remembers the last menu that was active in that screen and restores it as the active menu

In Multiscreen View, as in Single Screen View, tapping the blue tab or pressing the Mode/Meas front panel key opens the "Mode/Meas/View Dialog" on page 105 which allows you to change the Mode (or Measurement or View) being displayed in that Screen.

Remote Command	`:INSTrument:SCReen:MULTiple[:STATe] OFF | ON | 0 | 1` `:INSTrument:SCReen:MULTiple?`
Example	`:INST:SCR:MULT ON`
Notes	If only one screen is configured, attempting to set Multi-Screen ON generates the error "-221, Settings conflict; Multi-Screen requires >1 screen"
Preset	OFF

For more information, see the following:

- "Select Screen" on page 195
- "Screen List (Remote only command)" on page 196

2.18.1 Select Screen

You can select a screen by touching its tab or, in "Multiscreen" on page 193 mode, touching the screen itself. Selecting the Screen activates the screen and suspends the previously selected screen (if any).

Remote Command	`:INSTrument:SCReen:SELect <screen name>` `:INSTrument:SCReen:SELect?`
Example	`:INST:SCR:SEL "Baseband"`
Notes	If the <screen name> is specified but not found in the list of Screens, the error message "-224, Illegal parameter value; Screen Name not found" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; Screen SCPI cannot be used when Display is disabled" is generated

Preset	Returns the name of the active screen

2.18.2 Screen List (Remote only command)

You can obtain a list of currently configured Screens. This permits your remote program to manage screens for selection, renaming, or deletion.

Remote Command	`:INSTrument:SCReen:CATalog?`
Example	`:INST:SCR:CAT?`
Notes	The query response is a comma separated list of Screen Names. If only 1 Screen is configured, there is no trailing comma For R&S compatibility, the following query is also available: `:INSTrument:SCReen:LIST?`
Preset	Returns list of currently configured Screens

2.19 Fullscreen

The Fullscreen button is in the "Control Bar" on page 154, at the lower right corner of the display.

When **Full Screen** is pressed the measurement window expands horizontally over the entire instrument display. The screen graticule area expands to fill the available display area.

It turns off the display of the menu panel, however the controls that drop down from the Meas Bar and on-screen annotation are still available, and you can still drag the trace and markers and perform a pinch zoom, so you can still operate the instrument.

Pressing **Full Screen** again while Full Screen is in effect cancels Full Screen.

You can get even more screen area for your data display by turning off the Meas Bar using the Annotation tab of the Display menu)

Full Screen is canceled by the **Preset** key.

Remote Command	`:DISPlay:FSCReen[:STATe] OFF | ON | 0 | 1` `:DISPlay:FSCReen[:STATe]?`
Notes	This was set to Off by :SYST:DEF MISC in MXA1, but not by Preset. It is no longer set Off by :SYST:DEF MISC, since it is now meas global instead of mode global
Preset	Unaffected by Preset but set to Off by Restore Misc Defaults or shutdown and restart
State Saved	Not saved in instrument state
Backwards Compatibility SCPI	`:DISPlay:MENU[:STATe] OFF | ON | 0 | 1` This emulates ESA full screen functionality, which is the same as the FSCReen command in PSA except that the sense of on/off is reversed (that is, OFF means the menus are OFF, so Fullscreen is ON) and the default is ON (meaning Fullscreen is OFF)
Backwards Compatibility Notes	In ESA/PSA, Full Screen was turned on with a softkey, so pressing any other key turned Full Screen off. In the X-Series, because a hardkey is provided to turn this function on and off, pressing any other key no longer turns off Full Screen

3 LTE & LTE-A TDD Mode

The LTE Advanced TDD Mode is targeted for testing the transmitter of both the Base Station and User Equipment according to the following 3GPP standards.

LTE-Advanced standards	Version	Date
36.101 (UE Radio Tx/Rx)	11.7.0	12/2013
36.104 (BS Radio Tx/Rx)	12.6.0	12/2014
36.141 (BS Conformance)	12.6.0	12/2014
36.521-1 (UE Conformance)	11.3.0	12/2013

The mode supports the following measurements:

- Channel Power
- Occupied BW
- ACP
- SEM
- Spurious Emissions
- Transmit On|Off Power
- Modulation Analysis
- Conformance EVM
- Power Stat CCDF
- Monitor Spectrum
- IQ Waveform

The display mode and supported command set depend on the installed licenses, as follows.

- N9082EM0E LTE and LTE-Advanced TDD measurement application

Example	`:INSTrument[:SELect] LTEATDD` `:INSTrument:NSELect 108`
Status Bits/OPC dependencies	Changing Modes resets all SCPI status registers and mask registers to their power-on defaults. Therefore, event or condition register masks must be re-established after a Mode change

3.1 Measurement Commands

The commands for selecting each measurement are shown below. The commands relating to the Views and Windows for each measurement are described in the documentation for each measurement.

Example	Channel Power measurement:
	`:CONFigure:CHPower`
	Occupied Bandwidth measurement
	`:CONFigure:OBWidth`
	Adjacent Channel Power measurement
	`:CONFigure:ACPower`
	Spectrum Emissions Mask measurement
	`:CONFigure:SEMask`
	Spurious Emissions measurement
	`:CONFigure:SPURious`
	Transmit On|Off measurement
	`:CONFigure:PVTime`
	Modulation Analysis measurement
	`:CONFigure:EVM`
	Conformance EVM measurement
	`:CONFigure:CEVM`
	Power Stat CCDF measurement
	`:CONFigure:PSTatistic`
	Monitor Spectrum measurement
	`:CONFigure:MONitor`
	IQ Waveform measurement
	`:CONFigure:WAVeform`

Preset	MONitor
State Saved	Instrument State

3.2 Channel Power Measurement

This measurement is used to find the total power present in a specified bandwidth. Power Spectral Density (signal power normalized to 1 Hz) is also reported.

When in WLAN Mode, or when WLAN radio standard is selected in SA Mode, the peak Power Spectral Density for 1 MHz is reported.

Measurement Commands

The general functionality of "CONFigure" on page 2997, "INITiate" on page 2998, "FETCh" on page 2998, "MEASure" on page 3000, and "READ" on page 2999 are described in the section **SCPI Operation and Results Query** in the topic **Programming the Instrument**.

Note that, in general, `:CONF:<Measurement>` resets the specified measurement settings to their defaults. X-Series permits the addition of the `NDEFault` node to the command, which prevents a measurement preset after a measurement switch.

The tables below list setup commands for this measurement and queries to retrieve results.

Command	Function
`:INITiate:CHPower`	Initiates a trigger cycle for the `CHP` measurement, but does not return any data. You must then use `:FETC:CHP[n]?` to retrieve data Does not change any measurement settings
`:CONFigure?`	Returns the long form name of current measurement, in this case, `CHPower`
`:CONFigure:CHPower`	Selects `CHP` measurement with **Meas Setup** settings in preset state – same as "Meas Preset" on page 286
`:CONFigure:CHPower:NDEFault`	Selects `CHP` measurement *without* affecting settings

The following queries are used to retrieve data. The type of data returned depends on the value of `n`.

Query	Function
`:FETCh:CHPower[n]?`	Retrieves the data defined by `n`
`:MEASure:CHPower[n]?`	Switches to `CHP` measurement, restores default values, starts the measurement, then retrieves the data defined by `n`
`:READ:CHPower[n]?`	Starts the measurement, then retrieves the data defined by `n`

Backwards Compatibility Queries

Query	Return Value

`:FETCh:CHPower:CHPower?`
`:MEASure:CHPower:CHPower?`
`:READ:CHPower:CHPower?`
	Returns the Channel Power (dBm)

`:FETCh:CHPower:DENSity?`
`:MEASure:CHPower:DENSity?`
`:READ:CHPower:DENSity?`
	Returns the Power Spectral Density (dBm/Hz)

The results returned by the queries depend on the currently-selected Mode and the value of `n` (where required). The sections below provide mode-specific details for each Mode.

SA Mode Measurement Results

n	Results Returned		
1 or not specified	Returns scalar results:		
	1	Channel Power	A floating-point number representing the total channel power in the specified integration bandwidth
	2	PSD (Power Spectral Density)	The power in the specified unit bandwidth. The unit bandwidth is selected by "PSD Unit" on page 282; either dBm/Hz or dBm/MHz
2	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 1. The frequency span of the captured trace data is specified by "Span" on page 269		
3	n/a		
4	n/a		
5	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 2. The frequency span of the captured trace data is specified by **Span**		
6	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 3. The frequency span of the captured trace data is specified by **Span**		
7	Returns Marker Table data as a series of comma separated values in the following form: <Marker Number>,<Marker Trace>,<X>,<Y>,<Reserved>,<Reserved> Only markers that are enabled are included. <Reserved> are returned as NaN (“Not a Number”, 9.91e+37). The data is returned in the current sort order as displayed in the Marker Table		

MSR Mode Measurement Results

n	Results Returned
1 or not specified	Returns scalar results:

<table>
<tr><th>n</th><th>Results Returned</th></tr>
<tr><td></td><td>
<table>
<tr><td>1</td><td>Channel Power</td><td>A floating-point number representing the total channel power in the specified integration bandwidth</td></tr>
<tr><td>2</td><td>PSD (Power Spectral Density)</td><td>The power in the specified unit bandwidth. The unit bandwidth is selected by "PSD Unit" on page 282; either dBm/Hz or dBm/MHz</td></tr>
</table>

</table>

WLAN Channel Power Measurement Results

n	Results Returned
1 or not specified	Returns scalar results: When the radio standard is *not* 802.11ac 80 + 80 MHz or 802.11ax 80 + 80 MHz: **Channel Power** A floating-point number representing the total channel power in the specified integration bandwidth **Peak PSD (Power Spectral Density)** The peak PSD over the integration bandwidth. The unit bandwidth is selected by "PSD Unit" on page 282 in either dBm/Hz or dBm/MHz **Mean PSD (Power Spectral Density)** The mean PSD over the integration bandwidth. The unit bandwidth is selected by **PSD Unit** in either dBm/Hz or dBm/MHz When the radio standard is 802.11ac 80 + 80 MHz or 802.11ax 80 + 80 MHz: **Channel Power** of the carrier of which the center frequency is indicated by Freq Segment 1 A floating-point number representing the total channel power of the first segment in the specified integration bandwidth **Peak PSD (Power Spectral Density)** of the carrier of which the center frequency is indicated by Freq Segment 1 The power in the specified unit bandwidth of the first segment. The unit bandwidth is selected by **PSD Unit** in either dBm/Hz or dBm/MHz **Channel Power** of the carrier of which the center frequency is indicated by Freq Segment 2 A floating-point number representing the total channel power of the second segment in the specified integration bandwidth **Peak PSD (Power Spectral Density)** of the carrier of which the center frequency is indicated by Freq Segment 2 The power in the specified unit bandwidth of the second segment. The unit bandwidth is selected by **PSD Unit** in either dBm/Hz or dBm/MHz **Mean PSD (Power Spectral Density)** of the carrier of which the center frequency is indicated by Freq Segment 1 The power in the specified unit bandwidth of the first segment. The unit bandwidth is selected by **PSD Unit** in either dBm/Hz or dBm/MHz **Mean PSD (Power Spectral Density)** of the carrier of which the center frequency is indicated by Freq Segment 2 The power in the specified unit bandwidth of the second segment. The unit bandwidth is selected by **PSD Unit** in either dBm/Hz or dBm/MHz
2	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 1. The frequency span of the captured trace data is specified by "Span" on page 269
3	n/a
4	n/a

n	Results Returned
5	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 2. The frequency span of the captured trace data is specified by **Span**
6	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 3. The frequency span of the captured trace data is specified by **Span**
7	Returns Marker Table data as a series of comma separated values in the following form: <Marker Number>,<Marker Trace>,<X>,<Y>,<Reserved>,<Reserved> Only markers that are enabled are included. <Reserved> are returned as NaN ("Not a Number", 9.91e+37). The data is returned in the current sort order as displayed in the Marker Table

Additionally, WLAN Mode supports an `n` parameter for the following queries:

`:FETCh:CHPower:DENSity[n]?`

`:MEASure:CHPower:DENSity[n]?`

`:READ:CHPower:DENSity[n]?`

For these queries *in WLAN Mode only*, the results returned depend on the value of `n` as follows:

n	Radio Standard	Results Returned
1 or not specified	*Not* 802.11ac 80 +80 MHz or 802.11ax80 +80 MHz	**Peak PSD (Power Spectral Density)** The Peak PSD over the integration bandwidth. The unit bandwidth is selected by "PSD Unit" on page 282 in either dBm/Hz or dBm/MHz
	802.11ac 80 +80 MHz or 802.11ax80 +80 MHz	The first value is the peak PSD for segment 1, the second value is the peak PSD for segment 2
2	*Not* 802.11ac 80 +80 MHz or 802.11ax80 +80 MHz	**Mean PSD (Power Spectral Density)** The Mean PSD over the integration bandwidth. The unit bandwidth is selected by **PSD Unit** in either dBm/Hz or dBm/MHz
	802.11ac 80 +80 MHz or 802.11ax80 +80 MHz	The first value is the mean PSD for segment 1, the second value is the mean PSD for segment 2

3.2.1 Views

In SA, WCDMA, WLAN, SRCOMMS, and VMA Modes, there is only one predefined view, the "Normal" on page 207 view.

In MSR, LTEAFDD, LTEATDD, and 5GNR Modes, this measurement has two predefined views:

View	SCPI	View Number
"Normal" on page 207	`PRESult`	1
"Carrier Info" on page 207	`CINFormation`	2

View selection by name

Selects the results view by specifying the View name.

Remote Command	`:DISPlay:CHPower:VIEW[:SELect] PRESult | CINFormation` `:DISPlay:CHPower:VIEW[:SELect]?`
Example	`:DISP:CHP:VIEW PRES` `:DISP:CHP:VIEW?`
Preset	`PRESult`
State Saved	Saved in instrument state
Range	Power Results | Carrier Info

View selection by number

Selects the results view by specifying the View number.

Remote Command	`:DISPlay:CHPower:VIEW:NSELect <integer>` `:DISPlay:CHPower:VIEW:NSELect?`
Example	`:DISP:CHP:VIEW:NSEL 1` `:DISP:CHP:VIEW:NSEL?`
Preset	1
State Saved	Saved in instrument state
Min/Max	1 / 2

3.2.1.1 Normal

Windows: "Graph" on page 208, "Metrics" on page 209

Dual window view: Channel Power graph and Channel Power metrics.

Example	`:DISP:CHP:VIEW PRES`

3.2.1.2 Carrier Info

Windows: "Graph" on page 208, "Metrics" on page 209

Dual window view: Channel Power graph and Carrier Info table.

Example	`:DISP:CHP:VIEW CINF`
Dependencies	Only available in MSR, LTE-A FDD/TDD and 5G NR Modes

3.2.2 Windows

This section describes the windows that are available in the Channel Power measurement:

Window	Number
"Graph" on page 208	1
"Metrics" on page 209	2
"Gate" on page 212	3
"Marker Table" on page 213	4

3.2.2.1 Graph

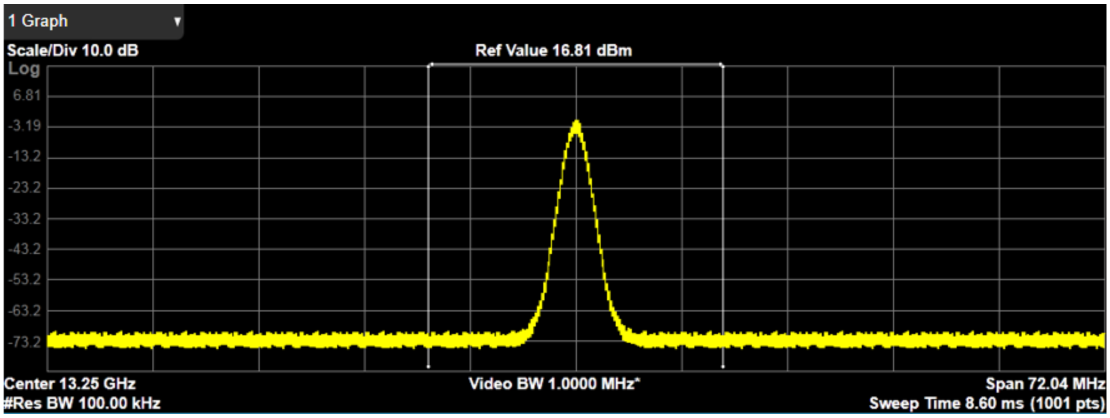
Window #1

Used to display the spectrum trace and power bars.

The results of the measurement can be displayed as a single spectrum trace view or displayed with a Bar Graph trace on the spectrum trace. The Bar Graph appears between the markers that indicate the measured output power level. The bar graph is activated when the “Bar Graph” control is set to ON under the Display menu. The Graph window appears in the following views.

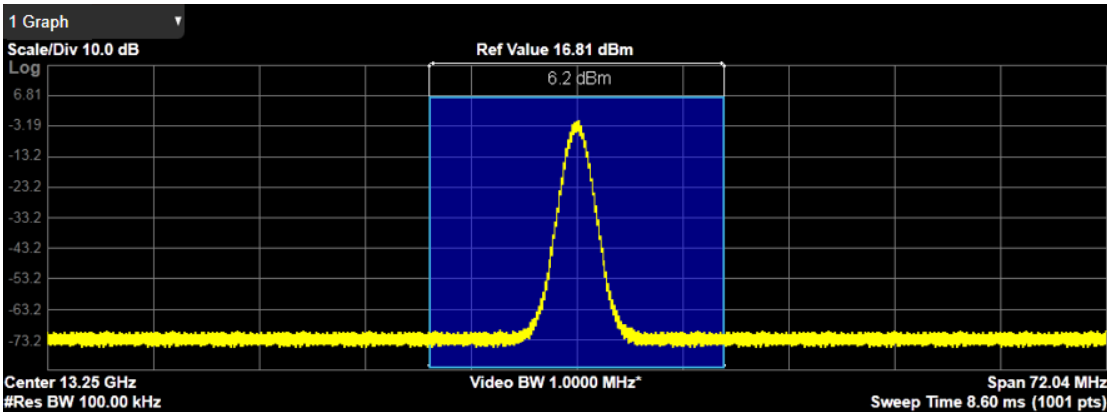
View	Size	Position
Normal	Two thirds, full width	Top
Gate View	One third, full width	Middle

Spectrum View with Bar Graph Off



Spectrum View with Bar Graph On

This is the same as the **Spectrum** view, but has a blue bar between the markers that indicates the measured output power level. The bar graph is activated when the “Bar Graph” control is set to ON under the **Display** hardkey. The actual measured output power level is displayed on the display at the top of the bar.



If the current Mode is WLAN and the format is WLAN 802.11ac 80+80 MHz, Spectrum View is slightly different so that the results of both carrier segments can be displayed.

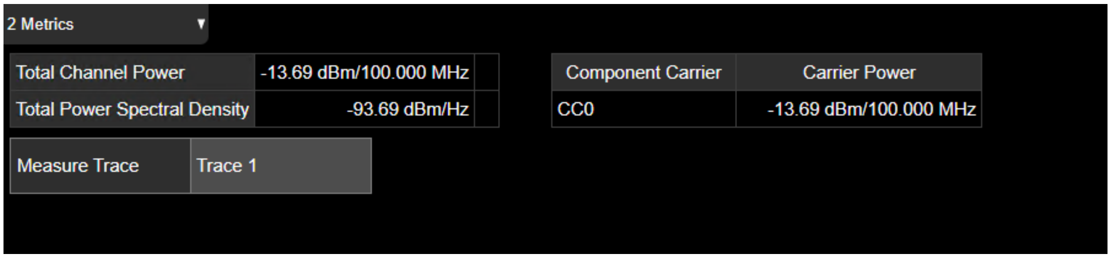
3.2.2.2 Metrics

Window #2

The actual measured output power level is displayed in the Metrics window

The **Metrics** window appears in the following Views.

View	Size	Position
Normal	One third, full width	Bottom
Gate View	One third, full width	Bottom



Total Channel Power	-13.69 dBm/100.000 MHz
Total Power Spectral Density	-93.69 dBm/Hz

Component Carrier	Carrier Power
CC0	-13.69 dBm/100.000 MHz

Measure Trace	Trace 1

Measure Trace

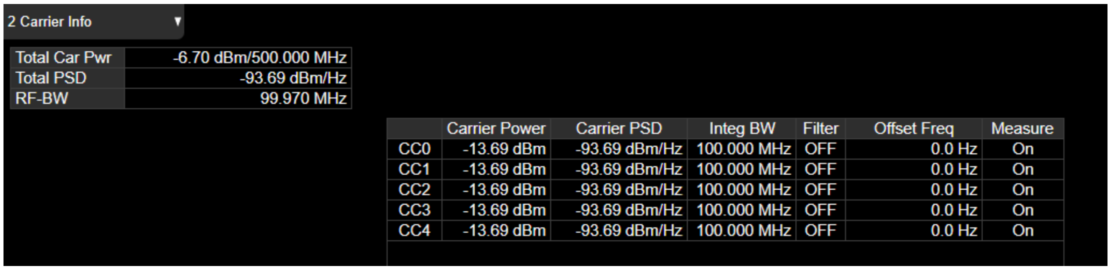
See: "Measure Trace" on page 1155.

Power Results

Total carrier power, total PSD and total format carrier power are displayed in the lower window. Total format carrier power is total power of carriers of the same Radio Format. If there is no carrier of the corresponding format, it is not displayed. Thus, items in the total format power table changes depending on the carrier configuration. Since the metrics window of MSR, LTE-Advanced FDD/TDD and 5G NR is slightly denser than that for common CHP, the vertical positions of total power and power spectral density are raised.

Carrier Info: LTE-Advanced FDD/TDD and 5G NR Modes

The following diagram shows the Metrics Window in the Carrier Info view for LTE-Advanced FDD/TDD and 5G NR. The Power Results window is replaced by the carrier info table.



Total Car Pwr	-6.70 dBm/500.000 MHz
Total PSD	-93.69 dBm/Hz
RF-BW	99.970 MHz

	Carrier Power	Carrier PSD	Integ BW	Filter	Offset Freq	Measure
CC0	-13.69 dBm	-93.69 dBm/Hz	100.000 MHz	OFF	0.0 Hz	On
CC1	-13.69 dBm	-93.69 dBm/Hz	100.000 MHz	OFF	0.0 Hz	On
CC2	-13.69 dBm	-93.69 dBm/Hz	100.000 MHz	OFF	0.0 Hz	On
CC3	-13.69 dBm	-93.69 dBm/Hz	100.000 MHz	OFF	0.0 Hz	On
CC4	-13.69 dBm	-93.69 dBm/Hz	100.000 MHz	OFF	0.0 Hz	On

The text window displays the following results:

Total Carrier Power

This is the total power of all the carriers with carrier measure state setting to On. The power is calculated by integrating across the bandwidth declared by the Carrier Integ Bw parameter for each carrier and then totaling the sums. The total integration bandwidth is shown as part of the result. This will be the total of the Carrier Integ Bw of the carriers used in calculating the total carrier power. If the RRC Filter is on, then the integration bandwidth used is (1 + alpha)/T where T = 1/(Carrier Integ Bw) multiplied by the number of carriers with carrier measure state setting to yes.

RF-BW

Displays the total bandwidth from the lowest carrier to the highest carrier, whether their measurement states are on or off.

Carrier Power

This is the power in all the currently defined carriers. If the carrier is with measurement state being on, the power will be absolute. If the carrier is defined as not having power present, the power will be shown up as dash. The power is calculated by integrating across the bandwidth declared by the Carrier Integ Bw parameter. The integration bandwidth is shown as part of the result. This is the value of the Carrier Integ Bw for the carrier unless the RRC Filter is on, then the integration.

Integration Bandwidth

Displays the channel bandwidth of each carrier.

Filter

Displays whether RRC filter is used or not.

Offset Frequency

Shows the offset frequency from the carrier reference frequency in multi-carrier measurements. The carrier frequency display type determines whether the relative frequency or absolute frequency will be displayed.

Sub-block (LTE-Advanced FDD/TDD Modes only)

For intra-band non-contiguous spectrum operation, the sub-block concept is introduced, which refers to one contiguous allocated block of spectrum for transmission and reception in the intra-band non-contiguous aggregation mode. We support two sub-blocks. It displays which sub-block the carrier belongs to in the intra-band non-contiguous aggregation mode. The column is displayed when the carrier allocation mode is non-contiguous.

Measure

Shows whether the carrier power presents or not.

The highlighted row changes as either Carrier Result or Select Carrier is changed. The highlighted row and these keys are not coupled.

Carrier Info: MSR Mode

The text window displays the following results:

Total Carrier Power

This is the total power of all the carriers with carrier measure state setting to On. The power is calculated by integrating across the bandwidth declared by the Carrier Integ Bw parameter for each carrier and then totaling the sums. The total integration bandwidth is shown as part of the result. This will be the total of the Carrier Integ Bw of the carriers used in calculating the total carrier power. If the RRC Filter is on, then the integration bandwidth used is (1 + alpha)/T where T = 1/(Carrier Integ Bw) multiplied by the number of carriers with carrier measure state setting to yes.

RF-BW

Displays the total bandwidth from the lowest carrier to the highest carrier, whether their measurement states are on or off.

Carrier Power

This is the power in all the currently defined carriers. If the carrier is with measurement state being on, the power will be absolute. If the carrier is defined as not having power present, the power will be shown up as dash. The power is calculated by integrating across the bandwidth declared by the Carrier Integ Bw parameter. The integration bandwidth is shown as part of the result. This is the value of the Carrier Integ Bw for the carrier unless the RRC Filter is on, then the integration.

Integration Bandwidth

Displays the channel bandwidth of each carrier.

Filter

Displays whether RRC filter is used or not.

Offset Frequency

Shows the offset frequency from the carrier reference frequency in multi-carrier measurements. The carrier frequency display type determines whether the relative frequency or absolute frequency will be displayed.

Sub-block

For intra-band non-contiguous spectrum operation, the sub-block concept is introduced, which refers to one contiguous allocated block of spectrum for transmission and reception in the intra-band non-contiguous aggregation mode. We support two sub-blocks. It displays which sub-block the carrier belongs to in the intra-band non-contiguous aggregation mode. The column is displayed when the carrier allocation mode is non-contiguous.

Measure

Shows whether the carrier power presents or not.

The highlighted row changes according to whether Carrier Result or Select Carrier is changed. The highlighted row and these keys are not coupled.

Parameter Set

Displays which format parameter set is selected.

3.2.2.3 Gate

Window #3

Turning on **Gate** View displays the **Gate** Window, which allows you to see your gating signal at the same time as the measured data. See the description under "Gate View On/Off" on page 2915 in **Trigger**, **Gate Settings**.

View	Size	Position
Gate View	One third, full width	Top

3.2.2.4 Marker Table

Window #4

Displays a table containing detailed information about all the markers in the current measurement. It can be selected from the Data control on the Window Title. There is no specific view in which the **Marker Table** window turns on, it is on by demand.

3.2.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.2.3.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The reference line is at the top, center, or bottom of the graticule, depending on the value of "Ref Position" on page 215.

Remote Command	`:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:RLEVel <real>` `:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:RLEVel?`
Example	`:DISP:CHP:WIND:TRAC:Y:RLEV 10 dBm` `:DISP:CHP:WIND:TRAC:Y:RLEV?`
Couplings	When "Auto Scaling" on page 215 is ON (default), this value is automatically determined by the measurement result. When you set a value manually, **Auto Scaling** changes to `OFF` Attenuation is not coupled to **Ref Value**

Preset	10.00 dBm
State Saved	Saved in instrument state
Min/Max	–/+250.00 dBm
Annotation	Ref <value> top left of graph
Backwards Compatibility SCPI	`:DISPlay:CHPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RLEVel`

Scale/Div

Sets the height of one division of the graticule in the current Y-Axis unit.

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule divisions on the display, the total amplitude range of the graph is typically 10x this amount. For example, if **Scale/Div** is 10 dB, then the total range of the graph is 100 dB.

Remote Command	`:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:PDIVision <rel_ampl>` `:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:PDIVision?`
Example	`:DISP:CHP:WIND:TRAC:Y:PDIV 5` `:DISP:CHP:WIND:TRAC:Y:PDIV?`
Couplings	Coupled to "Scale Range" on page 1002 as follows: **Scale/Div** = **Scale Range**/10 (number of divisions) When "Auto Scaling" on page 215 is `ON`, this value is automatically determined by the measurement result When you change a value, **Auto Scaling** automatically changes to `OFF`
Preset	10.00 dB / Div
State Saved	Saved in instrument state
Min	0.10 dB
Max	20 dB
Annotation	<value> dB/ left upper of graph
Backwards Compatibility SCPI	`:DISPlay:CHPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PDIVision`

Scale Range

Sets the Y-Axis scale range.

Remote Command	Replace `<meas>` with the identifier for the current measurement `:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe <rel_ampl>`

	`:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe?`
Example	`:DISP:CHP:WIND:TRAC:Y:RANG 100` `:DISP:CHP:WIND:TRAC:Y:RANG?`
Couplings	Coupled to **Scale/Div** as follows **Scale Range** = **Scale/Div** * 10 (number of divisions) When you change this value, **Auto Scaling** automatically changes to `OFF`
Preset	100 dB
State Saved	Saved in instrument state
Min	1
Max	200

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change the reference level value.

Remote Command	`:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:RPOSition TOP | CENTer | BOTTom` `:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:RPOSition?`
Example	`:DISP:CHP:WIND:TRAC:Y:RPOS CENT` `:DISP:CHP:WIND:TRAC:Y:RPOS?`
Preset	`TOP`
State Saved	Saved in instrument state
Range	`TOP|CENTer|BOTTom`
Annotation	The greater than (>) and less than (<) symbols are displayed on both sides of the graph to indicate the Reference Position
Backwards Compatibility SCPI	`:DISPlay:CHPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RPOSition`

Auto Scaling

Toggles **Auto Scaling** On or Off.

Remote Command	`:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:COUPle 0 | 1 | OFF | ON` `:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:COUPle?`
Example	`:DISP:CHP:WIND:TRAC:Y:COUP OFF` `:DISP:CHP:WIND:TRAC:Y:COUP?`
Couplings	When **Auto Scaling** is `ON`, and the **Restart** front-panel key is pressed, this function automatically sets the scale per division to 10 dB and determines the reference values based on the measurement results

	When you change the value of **Scale/Div**, **Ref Value**, or **Scale Range**, **Auto Scaling** automatically changes to `OFF`
Preset	1
State Saved	Saved in instrument state
Range	`OFF|ON`
Backwards Compatibility SCPI	`:DISPlay:CHPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:COUPle`

3.2.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

– See "Dual-Attenuator Configurations" on page 216

– See "Single-Attenuator Configuration" on page 217

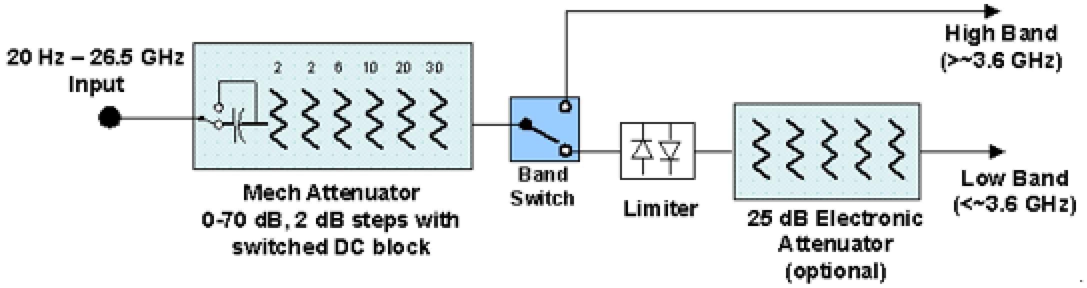
Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9420A/10A/11A/15A/16A, M9410E/11E/15E/16E, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

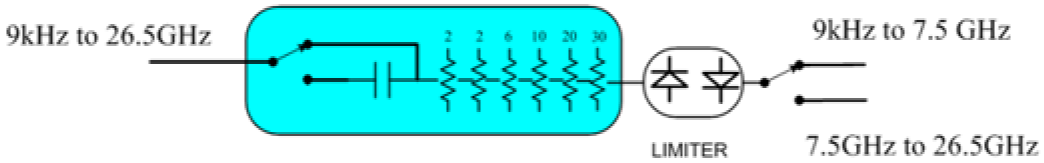
Dependencies	In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the **Range** tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

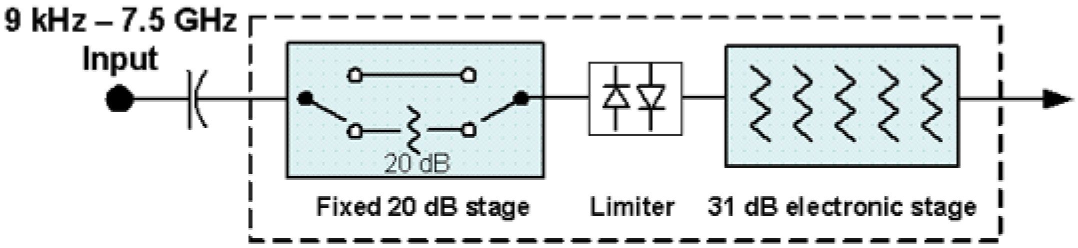


Configuration 2: Mechanical attenuator, no optional electronic attenuator

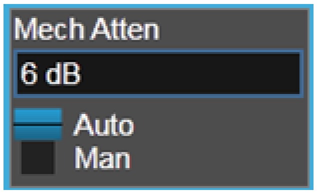


Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

Single-Attenuator Configuration

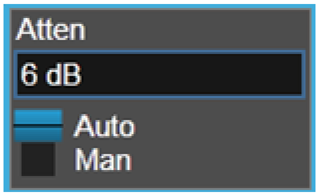


You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.



Mech Atten
6 dB
Auto
Man

Dual Attenuator



Atten
6 dB
Auto
Man

Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	`[:SENSe]:POWer[:RF]:FRATten <rel_ampl>` `[:SENSe]:POWer[:RF]:FRATten?`
Example	`:POW:FRAT 14` `:POW:FRAT?`
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See **Reference Level** and "Mech Atten" on page 2161 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	When the **Input** is **RF**, and the **Input Port** is **RF Input 2**, and the Full Range Attenuator is installed: On the Meas Bar, the field “Atten” displays as follows: – If the sweep is entirely < 50 GHz, the value shown after “Atten:” is equal to Mech Atten + Elec Atten + Full Range Atten – If the sweep is entirely > 50 GHz, the value shown after “Atten:” is equal to Full Range Atten – If the sweep straddles 50 GHz, the value shown after “Atten:” is preceded by the symbol “>=” and is equal to Full Range Atten

In the **Amplitude**, "Y Scale" on page 2153 menu, and the Atten **Meas Bar** dropdown menu panel, a summary is displayed as follows:

"Total Atten below 50 GHz" followed by the value of Full Range Atten + Mech Atten + Elec Atten

"Total Atten above 50 GHz" followed by the value of Full Range Atten

For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown:

- Attenuator summary:
- Total Atten below 50 GHz: 30 dB
- Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models, and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to **Ref Level**, "Internal Preamp" on page 2183 Gain, any External Gain that is entered, and **Max Mixer Level** (if available), as described in the table below.

See "Attenuator Configurations and Auto/Man" on page 221

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation <rel_ampl>` `[:SENSe]:POWer[:RF]:ATTenuation?`
Example	`:POW:ATT 20` Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of "main" attenuation) In either case, if the attenuator was in Auto, it is set to Manual
Dependencies	Some measurements do not support **Auto** setting of **Mech Atten**. In these measurements, the **Auto/Man** selection is not available, and the **Auto/Man** toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the **Auto/Man** toggle function is not available. The state of **Auto/Man** is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 2164 See "Attenuator Configurations and Auto/Man" on page 221 for more information on the **Auto/Man** functionality
Couplings	If the RF Input Port is the RF Input: – If the USB Preamp is connected to USB, use 0 dB for **Mech Atten** – Otherwise compute the auto-selected value of **Mech Atten** based on **Reference Level**, **Int Preamp**,

<table>
<tr><td></td><td>
External Gain, Ref Level Offset, Max Mixer Level, µW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto)
– In N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the value of "Full Range Atten" on page 2160 from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto)
In External Mixing and BBIQ, where the attenuator is not in the signal path, the attenuator setting changes as described above when Mech Atten is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input
For CXA-m with Option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is <= 7.5 GHz. So, when the frequency is changed from below 7.5 GHz to above 7.5 GHz, the attenuation setting changes to a multiple of 10 dB that is no smaller than the previous setting. For example, 4 dB attenuation changes to 10 dB
</td></tr>
<tr><td>Preset</td><td>Auto
The Auto value is 10 dB</td></tr>
<tr><td>State Saved</td><td>Saved in instrument state</td></tr>
<tr><td>Min</td><td>0 dB
The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased</td></tr>
<tr><td>Max</td><td>
<table>
<tr><td>CXA Option 503 or 507</td><td>50 dB</td></tr>
<tr><td>EXA</td><td>60 dB</td></tr>
<tr><td>All other models</td><td>70 dB</td></tr>
</table>
Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
</td></tr>
<tr><td>Annotation</td><td>The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as:
<i>Atten: <total> dB (e<elec>)</i>
The e letter is in amber in Single-Attenuator configurations
For example:
Dual-Attenuator configuration:
<i>Atten: 24 dB (e14)</i>
Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB
Single-Attenuator configuration:
<i>A: 24 dB (e14)</i>
Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation)
</td></tr>
</table>

When in Manual, a # sign appears in front of Atten in the annotation

Auto Function

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:ATTenuation:AUTO?`
Example	Turn **Auto Mech Atten** ON: `:POW:ATT:AUTO ON`
Dependencies	`:POW:ATT:AUTO` is only available in measurements that support **Auto**, such as Swept SA
Preset	ON

Attenuator Configurations and Auto/Man

As described under "Attenuation" on page 2158, there are two distinct attenuator configurations available in the X-Series, the Single Attenuator and Dual-Attenuator configurations.

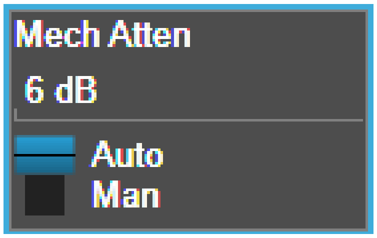
In Dual-Attenuator configurations, we have mechanical attenuation and electronic attenuation, and current total attenuation is the sum of electronic + mechanical attenuation.

In Single-Attenuator configurations, we refer to the attenuation set using "Mech Atten" on page 219 (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then current total attenuation is the sum of main + soft attenuation.

See "Elec Atten" on page 2164 for more about “soft” attenuation.

NOTE

In some measurements, the **Mech Atten** control has an **Auto/Man** function. In these measurements, an **Auto/Man** switch is shown on the **Mech Atten** control:



Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no **Auto/Man** function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten

10 dB

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details of the Electronic Attenuator, see "More Information" on page 224

Remote Command	`[:SENSe]:POWer[:RF]:EATTenuation <rel_ampl>` `[:SENSe]:POWer[:RF]:EATTenuation?`
Example	`:POW:EATT 10` `:POW:EATT?`
Notes	Electronic Attenuation's specification is defined only when **Mech Atten** is 6 dB
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no "electronic attenuator"; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, `EATT` SCPI commands are accepted for compatibility with other X-series instruments, and set a "soft" attenuation. The "soft" attenuation is treated as an addition to the "main" attenuation value set by the **Attenuation** control or `:POW:ATT`, and affects the total attenuation displayed on the **Attenuation** control and the Meas Bar The electronic attenuator, and the "soft" attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out If "Internal Preamp" on page 2183 is `ON` (that is, set to Low Band or Full), the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned If both the above are true, pressing the control generates error message -221, in other words, the

	frequency range lockout takes precedence If the electronic/soft Attenuator is enabled, then the **Stop Freq** of the instrument is limited to 3.6 GHz and **Internal Preamp** is unavailable If "LNA" on page 2185 is `ON`, the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out. This coupling works in the following modes/measurements: – Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes – Transmit On|Off Power measurement in 5GNR Mode – Power vs. Time and Transmit Power measurement in GSM/EDGE Mode – Burst Power measurement in Spectrum Analyzer Mode The SCPI-only "soft" electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement
Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in "Mechanical Attenuator Transition Rules" on page 224
Preset	0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the **Mech Atten** control description

Auto Function

Remote Command	`[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:EATTenuation:STATe?`
Example	`:POW:EATT:STAT ON` `:POW:EATT:STAT?`
Preset	`OFF` (Disabled) for Swept SA measurement `ON` (Enabled) for all other measurements that support the electronic attenuator

NOTE The maximum **Center Frequency** for Low Band can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values <= 40 MHz have a maximum Low Band frequency of 3.6 GHz, while 40 MHz < IFBW <= 1 GHz have a maximum of

3.3 GHz, and 1 GHz < IFBW <= 1.5 GHz have a maximum of 3.5 GHz. This frequency is reflected in the disabled message displayed for Electrical Attenuator. For N9032B and N9042B IFBW values > 1.5 GHz do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, the Electrical Attenuator will remain disabled no matter the Center Frequency.

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See "Using the Electronic Attenuator: Pros and Cons" on page 225 for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the “soft” attenuation feature replaces the Dual-Attenuator configuration’s electronic attenuator. All the same couplings and limitations apply. See "Attenuator Configurations and Auto/Man" on page 2163

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled
- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled

- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "Pre-Adjust for Min Clipping" on page 2168.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Example	`:POW:RANG:OPT IMM`
Notes	Executing **Adjust Atten for Min Clipping** initiates the measurement
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate` is executed.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLy | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?`
Example	`:POW:RANG:OPT:TYPE EONL` `:POW:RANG:OPT:TYPE?`
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	`COMBined`
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is `ON`, it applies the adjustment described under "Adjust Atten for Min Clipping" on page 2167 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "Adjustment Algorithm" on page 228

Selection	SCPI	Note
Off	`OFF`	This is the default setting
On	`ON`	Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the `ON` parameter is supported and mapped to `COMBined`
Elec Atten Only	`ELECtrical`	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Elec+Mech Atten	`COMBined`	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Example	`:POW:RANG:OPT:ATT OFF` `:POW:RANG:OPT:ATT?`
Notes	The parameter option `ELECtrical` sets this function to `ON` in Single-Attenuator models The parameter option `COMBined` is mapped to `ELECtrical` in Single-Attenuator models. If you send `COMBined`, it sets the function to `ON` and returns `ELEC` to a query For SCPI compatibility with models that do not have an input attenuator, the `ON` parameter is honored and mapped to `COMBined`
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when "Elec Atten" on page 2164 is `OFF` or grayed-out, "Pre-Adjust for Min Clipping" on page 226 is grayed-out Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	`OFF` when Elec Atten is Disabled at preset, otherwise `ELEC`
State Saved	Saved in instrument state
Range	Dual-Attenuator models: Off | Elec Atten Only | Mech + Elec Atten Single-Attenuator models: Off | On

Backwards Compatibility Command

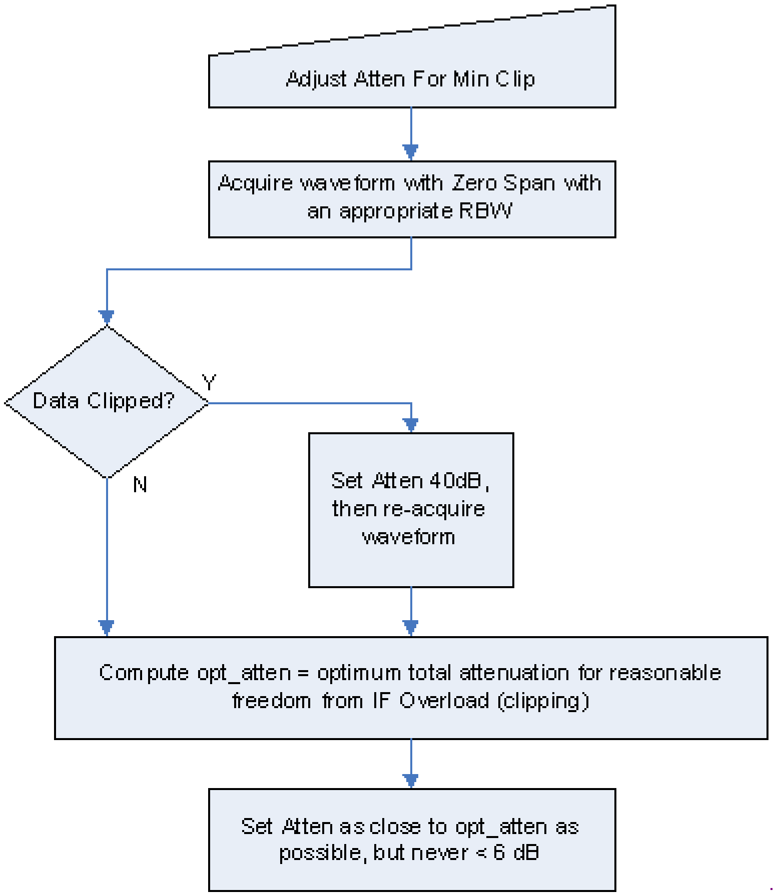
Notes	`ON` aliases to "Elec Atten Only" (`:POW:RANG:OPT:ATT ELEC`) `OFF` aliases to "Off" (`:POW:RANG:OPT:ATT OFF`)

	`:POW:RANG:AUTO?` returns true if `:POW:RANG:OPT:ATT` is not `OFF`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:RANGe:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:RANGe:AUTO?`

Adjustment Algorithm

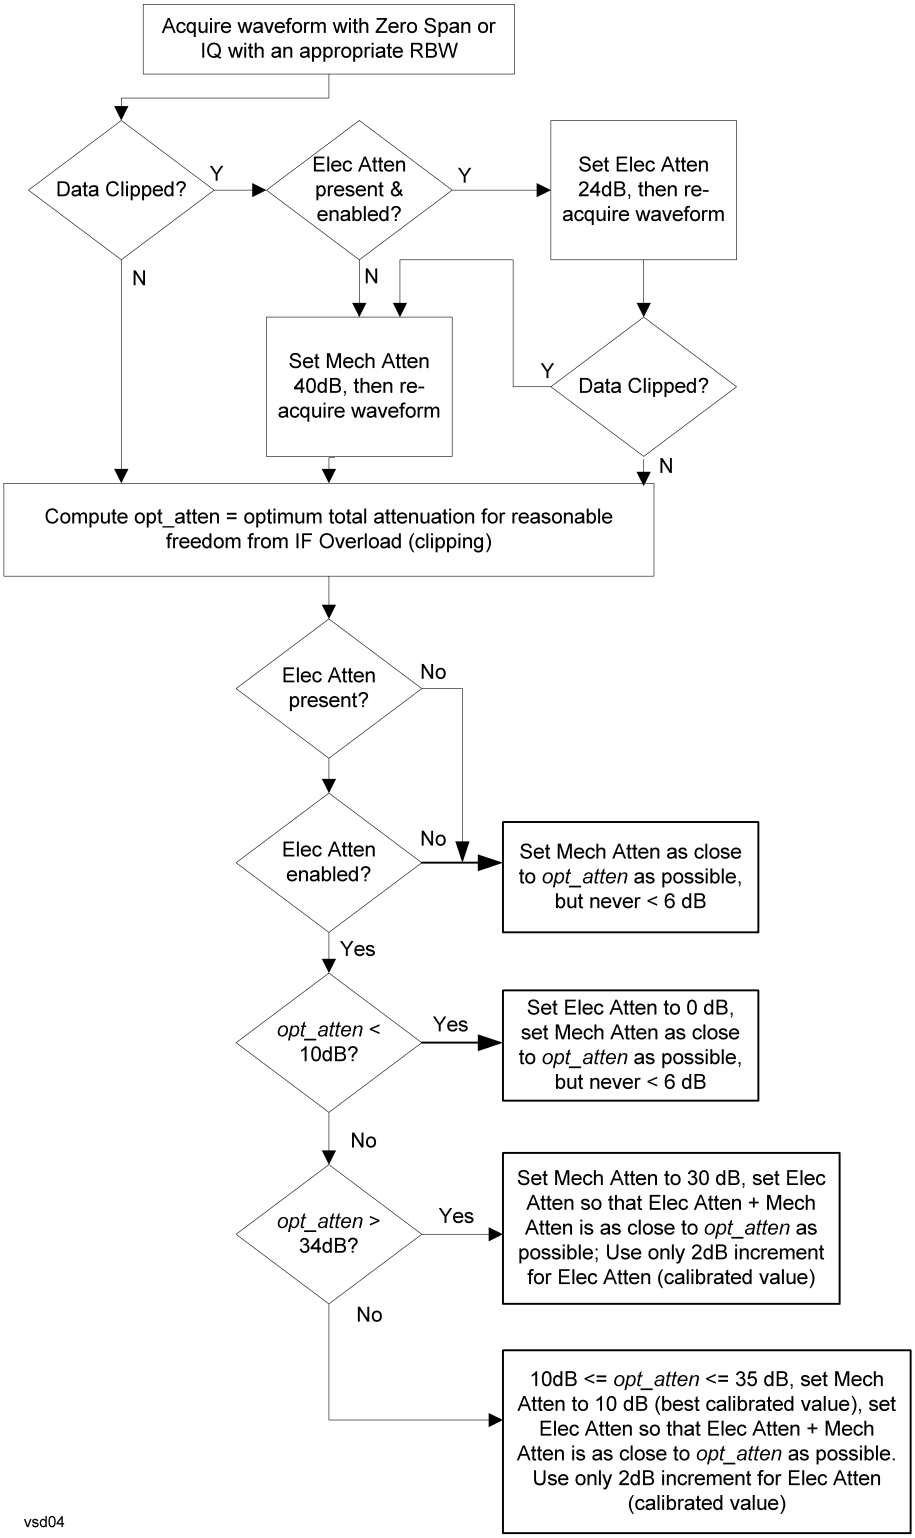
The algorithms for the adjustment are documented below:

Single-Attenuator Models



Dual-Attenuator models

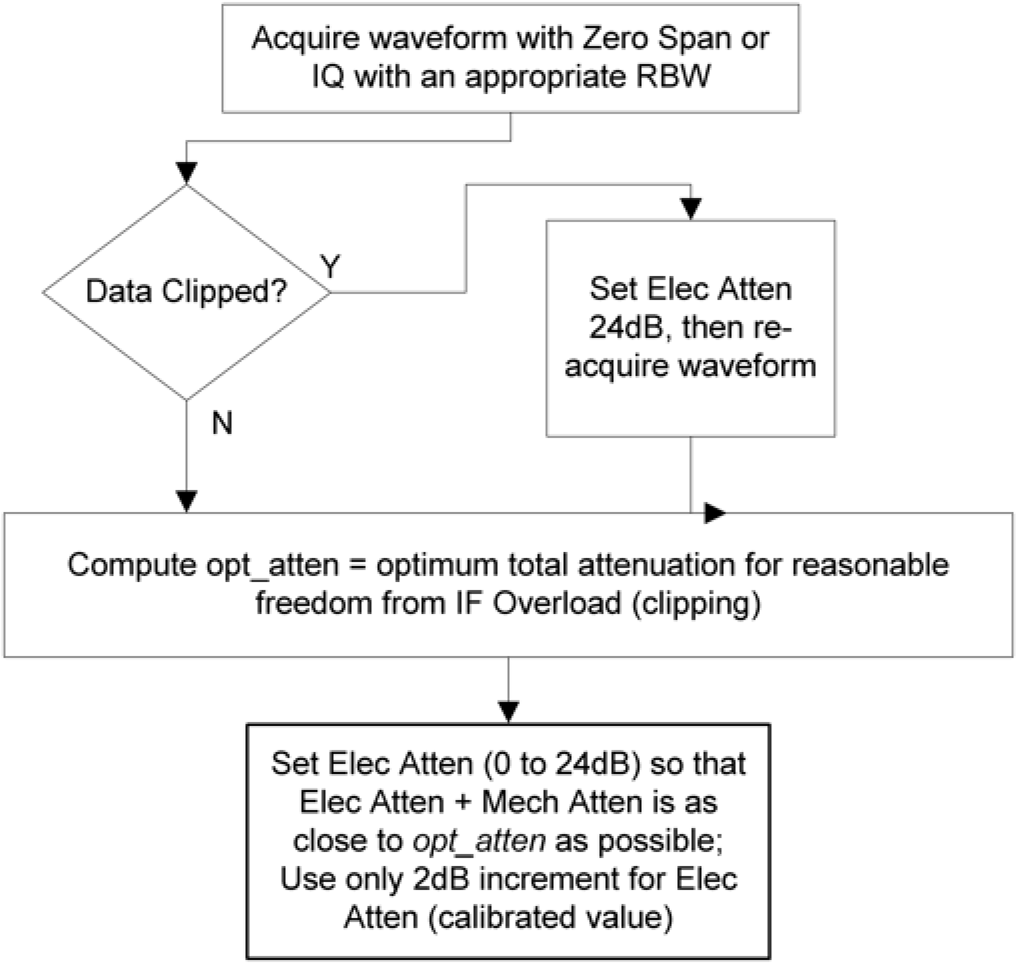
"Adjust Atten for Min Clipping" on page 2167 or "Pre-Adjust for Min Clipping" on page 226 selection is Mech + Elec Atten:



Acquire waveform with Zero Span or IQ with an appropriate RBW
Data Clipped?
Y
N
Elec Atten present & enabled?
Y
N
Set Elec Atten 24dB, then re-acquire waveform
Set Mech Atten 40dB, then re-acquire waveform
Y
Data Clipped?
N
Compute opt_atten = optimum total attenuation for reasonable freedom from IF Overload (clipping)
Elec Atten present?
No
Elec Atten enabled?
No
Set Mech Atten as close to *opt_atten* as possible, but never < 6 dB
Yes
opt_atten < 10dB?
Yes
Set Elec Atten to 0 dB, set Mech Atten as close to *opt_atten* as possible, but never < 6 dB
No
opt_atten > 34dB?
Yes
Set Mech Atten to 30 dB, set Elec Atten so that Elec Atten + Mech Atten is as close to *opt_atten* as possible; Use only 2dB increment for Elec Atten (calibrated value)
No
10dB <= *opt_atten* <= 35 dB, set Mech Atten to 10 dB (best calibrated value), set Elec Atten so that Elec Atten + Mech Atten is as close to *opt_atten* as possible. Use only 2dB increment for Elec Atten (calibrated value)
vsd04

"Pre-Adjust for Min Clipping" on page 226 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.



Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?`
Example	`:POW:ATT:STEP 2` `:POW:ATT:STEP?`
Notes	Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

3.2.3.3 Range (Non-attenuator models)

Only available for Keysight’s modular signal analyzers and certain other Keysight products, such as VXT and M941xE.

State Saved	No

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe <real>` `[:SENSe]:POWer[:RF]:RANGe?`
Example	`:POW:RANG 10 dBm` `:POW:RANG?`
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the **Center Frequency** The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min/Max	–/+100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements

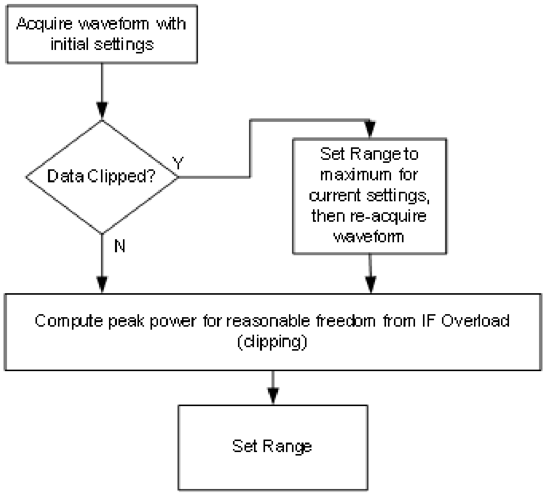
Pre-Adjust for Min Clipping

If this function is `ON`, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Notes	Because there is no attenuator control available in these models, the control displays only `ON` and `OFF` choices. However, for SCPI compatibility with other platforms, all three parameters (`ELECtrical`, `COMBined`, and `ON`) are honored and all are mapped to `ELECtrical`, so if any of these three parameters is sent, a subsequent query will return `ELEC`
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements
Preset	`OFF` for Swept SA measurement; `ON` for all other measurements that support **Pre-Adjust for Min Clipping**
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:



Peak-to-Average Ratio

Used with "Range (Non-attenuator models)" on page 2177 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:PARatio <real>` `[:SENSe]:POWer[:RF]:RANGe:PARatio?`	
Example	`:POW:RANG:PAR 12 dB`	
Notes	In some Modes, this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempts to change the value via SCPI are ignored, but no error message is generated	
Dependencies	Does not appear in Spectrum Analyzer Mode	
Preset	VXT Models M9410A/11A	0 dB
	All Others	10 dB
State Saved	Saved in instrument state	
Min	0 dB	
Max	VXT Models M9410A/11A	50 dB
	All Others	20 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "Peak-to-Average Ratio" on page 2179. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real>` `[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?`	
Example	`:POW:RANG:MIX:OFFS -5 dB`	
Preset	0 dB	
State Saved	Saved in instrument state	
Min	VXT Models M9410A/11A	-34 dB
	All Others	-35 dB
Max	30 dB	

3.2.3.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9420A, or UXM.

This tab *does* appear in VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E, because "Software Preselection" on page 2195 is under this tab, and VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range

between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "Preselector Adjust" on page 2182 changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in "Proper Preselector Operation" on page 235.

Remote Command	`[:SENSe]:POWer[:RF]:PCENter`
Example	`:POW:PCEN`
Notes	The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command
Dependencies	Does not appear in CXA-m, nor in VXT Models M9410A/11A/15A/16A, M9410E/11E/15E/16E Grayed-out if the microwave preselector is off – If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken – Grayed-out if entirely in Band 0, that is, if **Stop Freq** is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if **Start Freq** is above 50 GHz – Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 – Grayed-out in the **Spectrogram** View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering appears in "Preselector Adjust" on page 2182
Status Bits/OPC dependencies	When centering the preselector, `*OPC` does not return true until the process is complete and a subsequent measurement has completed, nor are results returned in response to `:READ` or `:MEASure` queries The `Measuring` bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak

search to find

2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "Presel Center" on page 2181 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	`[:SENSe]:POWer[:RF]:PADJust <freq>` `[:SENSe]:POWer[:RF]:PADJust?`
Example	`:POW:PADJ 100KHz` `:POW:PADJ?`
Notes	The value on the control is displayed to 0.1 MHz resolution
Dependencies	– Does not appear in CXA-m – Does not appear in VXT Models M9410A/11A/15A/16A – Does not appear in M9410E/11E/15E/16E – Grayed-out if microwave preselector is off – Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz – Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the **Spectrogram** View
Preset	0 MHz

State Saved	The **Preselector Adjust** value set by "Presel Center" on page 2181, or by manually adjusting **Preselector Adjust** Not saved in instrument state, and does not survive a Preset or power cycle
Min/Max	–/+500 MHz
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PADJust` `[:SENSe]:POWer[:RF]:MMW:PADJust`

Backwards Compatibility Command

Notes	The command has no effect, and the query always returns `MWAVe`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVe | MMWave | EXTernal` `[:SENSe]:POWer[:RF]:PADJust:PRESelector?`

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	:POW:GAIN OFF	
Low Band	:POW:GAIN ON :POW:GAIN:BAND LOW	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	:POW:GAIN ON :POW:GAIN:BAND FULL	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE The maximum **Center Frequency** for **Low Band**, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values <= 40 MHz have a maximum **Low Band** frequency of 3.6 GHz, while 40 MHz < IFBW <= 1 GHz have a maximum of 3.3 GHz, and 1 GHz < IFBW <= 1.5 GHz have a maximum of 3.5 GHz. IFBW values > 1.5 GHz do not support a **Center Frequency** that can reach the **Low Band** maximum frequency. In these cases, **N/A** is displayed in the square brackets for **Low Band**.

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:BAND LOW | FULL` `[:SENSe]:POWer[:RF]:GAIN:BAND?`
Example	`:POW:GAIN:BAND LOW` `:POW:GAIN:BAND?`
Dependencies	Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A nor in M9410E/11E/15E/16E If `:POW:GAIN:BAND FULL` is sent when a low band preamp is available, the preamp band parameter is set to `LOW` instead of `FULL`, and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled
Preset	`LOW`
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says “Off” if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says “3.6 GHz”. If it is a 13.6 GHz preamp and it is set to Full Range the annotation says “13.6 GHz” When the USB Preamp is connected to USB, the Preamp annotation says “Preamp: USB” if the internal preamp is off or “Preamp: USB, Int” if the internal preamp is on (only for measurements that support the USB preamp)

Auto Function

Remote Command	`[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN[:STATe]?`
Example	`:POW:GAIN OFF` `:POW:GAIN?`
Preset	`OFF`

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to "Internal Preamp" on page 2183. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

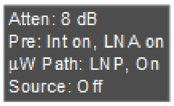
For best possible sensitivity, **LNA** can be turned on *together* with "Internal Preamp" on page 2183, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see "More Information" on page 239

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?`
Example	`:POW:GAIN:LNA ON`
Dependencies	Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9420A/10A/11A M9410E/11E/15E/16E support LNA May not appear in some measurements **LNA** is not available when the electronic/soft attenuator is enabled
Preset	`OFF`
State Saved	Saved in State

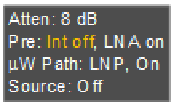
More Information

When **LNA** is installed, the preamp annotation changes to show the state of both **LNA** and **Internal Preamp**. Below is an example:



Atten: 8 dB
Pre: Int on, LNA on
µW Path: LNP, On
Source: Off

Note that when operating entirely in the low band (below about 3.6 GHz), if **LNA** is on, **Internal Preamp** is switched off (even if you have its switch set to `ON`). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:



Atten: 8 dB
Pre: Int off, LNA on
µW Path: LNP, On
Source: Off

µW Path Control

Options for this control include **µW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the µW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **µW Preselector Bypas**s, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the µW Preselector’s bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21-26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp’s compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **µW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. µW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See "Low Noise Path Enable" on page 244
µW Preselector Bypass	:POW:MW:PATH MPB	See "µW Preselector Bypass" on page 246
Full Bypass Enable	:POW:MW:PATH FULL	See "Full Bypass Enable" on page 247

<table>
<tr><td>Remote Command</td><td><code>[:SENSe]:POWer[:RF]:MW:PATH STD | LNPath | MPBypass | FULL</code>
<code>[:SENSe]:POWer[:RF]:MW:PATH?</code></td></tr>
<tr><td>Example</td><td><code>:POW:MW:PATH LNP</code>
Enables the Low Noise path
<code>:POW:MW:PATH?</code></td></tr>
<tr><td>Notes</td><td>When "Presel Center" on page 2181 is performed, the instrument momentarily switches to the Standard Path, regardless of the setting of µW Path Control
The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean “when the low noise path is enabled” but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is Low Noise Path Enable or Full Bypass Enable. In the case where the DC Block is switched in, the instrument is now AC-coupled. However, if you selected DC coupling, the UI would still behave as though it were DC-coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC-coupled
Alignment switching ignores the settings in this menu, and restores them when finished</td></tr>
<tr><td>Dependencies</td><td>Does not appear in CXA-m, VXT Models M9410A/11A/15A/16A, nor in M9410E/11E/15E/16E, BBIQ and External Mixing
– The Low Noise Path Enable selection does not appear unless Option LNP is present and licensed
– The µW Preselector Bypass selection does not appear unless Option MPB is present and licensed
– The Full Bypass Enable selection does not appear unless options LNP and MPB are both present as well as option FBP
In any of these cases, if the required options are not present and the SCPI command is sent, error -241, "Hardware missing; Option not installed" is generated
Low Noise Path Enable and Full Bypass Enable are grayed-out if the current measurement does not support them
Low Noise Path Enable and Full Bypass Enable are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, “Setting Conflict; Feature not supported for this measurement”</td></tr>

Annotation	In the Meas Bar, if the Standard path is chosen: µW Path: Standard If Low Noise Path is enabled but the LNP switch is not thrown: µW Path: LNP,Off If the Low Noise Path is enabled and the LNP switch *is* thrown: µW Path: LNP,On If the preselector is bypassed: µW Path: Bypass If Full Bypass Enable is selected but the LNP switch is not thrown: µW Path: FByp,Off If Full Bypass Enable is selected and the LNP switch *is* thrown: µW Path: FByp,On

µW Path Control Auto

In VMA, WLAN, 5G NR, CQM Modes, an **Auto/Man** switch is added to **µW Path Control**:

This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

Measurement	µW Path Control Auto behavior
Digital Demod	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Custom OFDM	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Measurement	µW Path Control Auto behavior
ACP	Always Presel Bypass
SEM	Always Presel Bypass
Spurious Emissions	Always Standard Path

WLAN Mode

Measurement	µW Path Control Auto behavior
Modulation Analysis	Always Presel Bypass
Spectral Flatness	Always Presel Bypasss
Power vs Time	Always Presel Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Always Presel Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Always Presel Bypass
SEM	For 11be 320M, when ‘Enabled Wideband IF for FFT’ is OFF or ‘Sweep Type Rule’ is Best Dynamic Range, auto µW path is standard For other cases, auto µW path is presel bypass if presel bypass is enabled, auto µW path is standard if presel bypass is not enabled
Spurious Emissions	Always Standard Path

5G NR Mode

Measurement	µW Path Control Auto behavior
Modulation Analysis	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Channel Power	Always Standard Path
Occupied BW	Always Standard Path
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Standard Path
SEM	Always Standard Path
Spurious	Always Standard Path

Measurement	µW Path Control Auto behavior
Emissions	
Transmit On|Off Power	Use Standard Path unless tuned frequency > 3.6 GHz and Info BW > 15 MHz, in which case choose Preselector Bypass

Channel Quality Mode

Measurement	µW Path Control Auto behavior
Group Delay	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Remote Command	`[:SENSe]:POWer[:RF]:MW:PATH:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:MW:PATH:AUTO?`
Example	`:POW:MW:PATH:AUTO ON` `:POW:MW:PATH:AUTO?`
Dependencies	Only appears in VMA, WLAN, 5G NR and CQM Modes
Couplings	See "µW Path Control Auto" on page 242 above
Preset	`ON`
Range	`ON|OFF`

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used,

whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

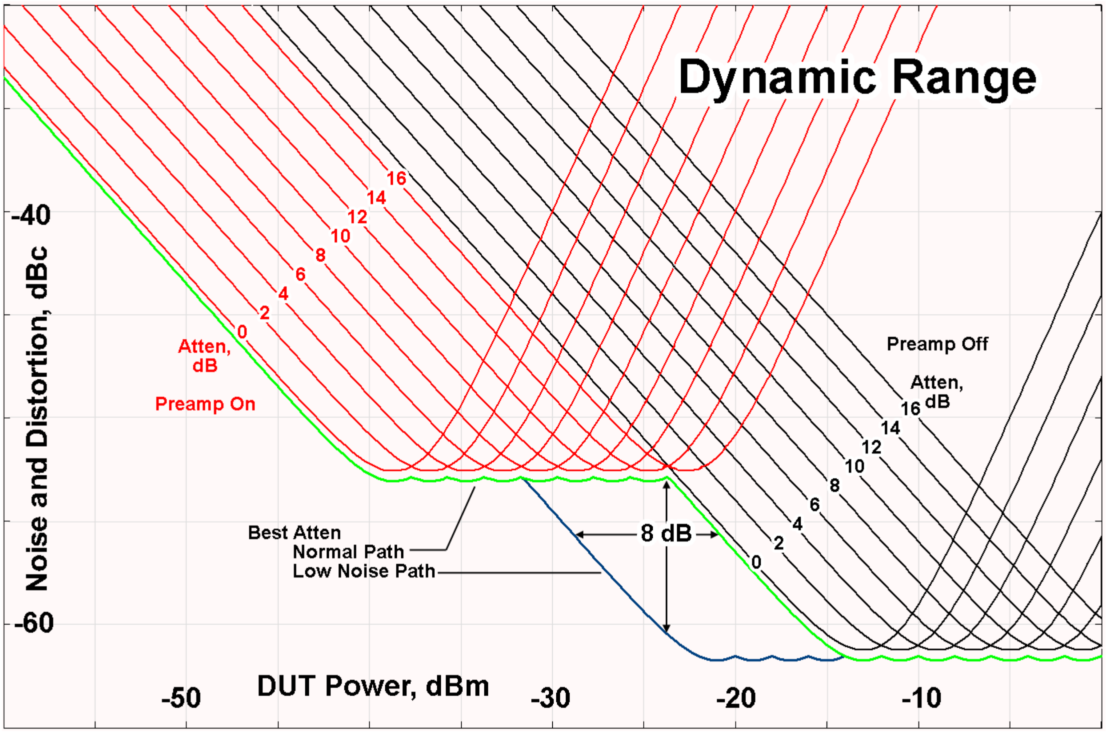
Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.



There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

µW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave presel is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and "Y Scale" on page 2153 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently,

whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:
“Full Bypass Enabled, maximum safe input power reduced”

Microwave Preselector Bypass Backwards Compatibility

Example	Bypass the microwave preselector: `:POW:MW:PRES OFF`
Notes	Included for Microwave Preselector Bypass backwards compatibility The `ON` parameter sets the `STD` path (`:POW:MW:PATH STD`) The `OFF` parameter sets path `MPB` (`:POW:MW:PATH MPB`)
Preset	`ON`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON | OFF | 0 | 1` `[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?`

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender’s preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is `OFF`, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

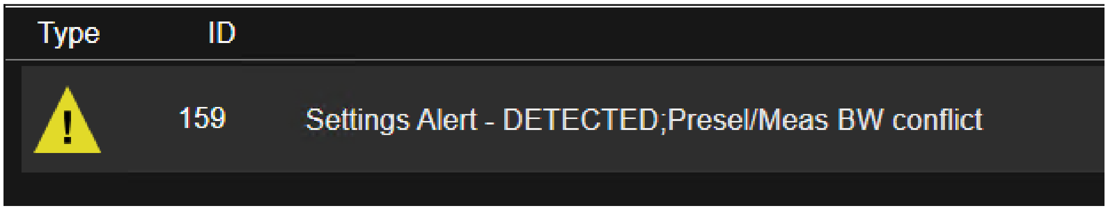
An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert;Presel/Meas BW conflict

Settings Alert message in the error queue

.



159 Settings Alert - DETECTED;Presel/Meas BW conflict

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A/15A/16A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection `ON` at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:STATe 0 | 1 | ON | OFF` `[:SENSe]:POWer[:RF]:SWPresel:STAT?`
Example	`:POW:SWPR:STAT 1` `:POW:SWPR:STAT?`
Dependencies	Only appears in N9041B, N9042B+V2050A, VXT models M9410A/11A and M9410E/11E. Does not appear in all measurements
Couplings	Affects **Sweep Time** **Auto Tune** supports **Software Preselection**, so **Auto Tune** should be performed after setting the **Software Preselection** state
Preset	N9041B: `OFF` N9042B+V3050A: `ON` M9410A/11A: `ON`
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by 2 * IF / N. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- `NORMal` - mathematically removes all image and multiple responses of signals present at the input
- `ADVanced` - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel NORMal | ADVanced` `[:SENSe]:POWer[:RF]:SWPResel?`
Example	`:POW:SWPR NORM` `:POW:SWPR?`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 2195 is `OFF`. The grayout message is “Unavailable unless SW Presel enabled”
Preset	N9041B: `ADVanced` N9042B+V3050A: `NORMal`
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- `NORMal` – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for `NARRow` (below)
- `NARRow`– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from

wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:BW NORMal | NARRow` `[:SENSe]:POWer[:RF]:SWPResel:BW?`
Example	`:POW:SWPR:BW NARR`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 2195 is `OFF`. The grayout message is "Unavailable unless SW Presel enabled" For N9042B+V3050A, the parameter is SCPI-only, and always set to `NARRow` when **Software Preselection** is enabled
Preset	N9041B: `NORMal` N9042B+V3050A: `NARRow`
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A and M9410E/11E in bypass frequency range (1310MHz~5GHz), the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the "Prefilter" bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	`[:SENSe]:<measurement>:PFILter[:STATe] ON | OFF | 1 | 0` `[:SENSe]:<measurement>:PFILter[:STATe]?`

Example	Enable High Freq Prefilter for the Complex Spectrum Measurement in `BASIC` Mode:
	`:SPEC:PFIL ON`
	Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes:
	`:WAV:PFIL ON`
	Enable High Freq Prefilter for the Swept SA Measurement in `SA` Mode:
	`:SAN:PFIL ON`

Dependencies	Only appears in VXT models M9410A/11A with center frequency above 1310 MHz, and M9410E/11E in frequency range 1310MHz~5GHz
Preset	See "Prefilter Presets" on page 253 below
State Saved	Saved in instrument state

Prefilter Presets

Meas	Mode	Preset
`SPEC`	`BASIC`	`OFF`
`WAV`	`BASIC, WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA`	`OFF`
`MON`	`WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA`	`OFF`
`RHO`	`WCDMA`	`OFF`
`CDP`	`WCDMA`	`OFF`
`PCON`	`WCDMA`	`OFF`
`EVMQ`	`WCDMA`	`OFF`
`CHP`	`WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA`	`OFF`
`OBW`	`WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA`	`OFF`
`ACP`	`WCDMA, LTEAFDD, LTEATDD, 5GNR, VMA, SA`	`OFF`
`SEM`	`WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA`	`OFF`
`PST`	`WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA`	`OFF`
`PVT`	`WLAN, LTEAFDD, LTEATDD, 5GNR`	`OFF`
`EVM`	`WLAN, LTEAFDD, LTEATDD, 5GNR`	`OFF`
`FLAT`	`WLAN`	`OFF`
`EVMM`	`WLAN`	`OFF`
`CEVM`	`LTEAFDD, LTEATDD`	`OFF`
`PAVT`	`5GNR, VMA`	`OFF`
`DDEM`	`VMA`	`OFF`
`OFDM`	`VMA`	`OFF`
`SAN`	`SA`	`ON`
`HARM`	`SA`	`ON`

3.2.4 BW

Opens the Bandwidth (**BW**) menu, which contains controls for the Resolution Bandwidth and Video Bandwidth functions of the instrument.

The Resolution BW functions control filter bandwidth and filter type. There are two filter types, Gaussian and Flattop. The Gaussian filters have a response curve that is parabolic on a log scale. The Flattop filter shape is a close approximation of a rectangular filter.

3.2.4.1 Settings

Contains the basic bandwidth functions. In most measurements it is the only tab under Bandwidth.

Res BW

Activates the resolution bandwidth active function, which allows you to manually set the resolution bandwidth (RBW) of the instrument.

Normally, **Res BW** (**Auto**) selects automatic coupling of **Res BW** to "Span" on page 269, using the ratio set by **Span:3 dB RBW** (some measurements do not have a Span:3 dB RBW control, in which case the measurement chooses the optimal ratio). To decouple the resolution bandwidth, press the **Auto/Man** toggle on **Res BW**, or simply enter a different value for **Res BW**.

When **Res BW** is manually selected, you can return it to the coupled state by pressing the **Auto/Man** toggle on **Res BW**. This may also be done by pressing "Auto Couple" on page 2242 or by performing a **Preset**.

For more details, see "More Information" on page 255

Remote Command	`[:SENSe]:CHPower:BANDwidth[:RESolution] <bandwidth>` `[:SENSe]:CHPower:BANDwidth[:RESolution]?`
Example	`:CHP:BAND 5 MHz` `:CHP:BAND?`
Notes	For numeric entries, all RBW Types choose the nearest (arithmetically, on a linear scale, rounding up) available RBW to the value entered The setting and querying of values depend on the current bandwidth type
Couplings	Sweep time is coupled to RBW. As RBW changes, the sweep time (if set to **Auto**) is changed to maintain amplitude calibration Video bandwidth (VBW) is coupled to RBW. As the resolution bandwidth changes, the video bandwidth (if set to **Auto**) changes to maintain the ratio of VBW/RBW (10:1) When Res BW is set to **Auto**, the resolution bandwidth is auto-coupled to the span. The ratio of Span/RBW is approximately 106:1 when auto coupled. When Res BW is set to Man, and the bandwidths are entered manually, these bandwidths are used regardless of other instrument settings
Preset	See "RBW Presets" on page 255
State Saved	Saved in instrument state
Min	1 Hz
Max	8 MHz is the max equivalent –3 dB RBW, which means that the named RBW (the one shown on the control etc.) can actually exceed 8 MHz if using a filter other than –3 dB Gaussian
Annotation	A “#” mark appears before “RBW” in the annotation when it is switched from Auto to Manual coupling
Backwards Compatibility Notes	For backwards compatibility, this command supports both the `BANDwidth` and `BWIDth` forms

Auto Function

Remote	`[:SENSe]:CHPower:BANDwidth[:RESolution]:AUTO ON | OFF | 1 | 0`

Command	`[:SENSe]:CHPower:BANDwidth[:RESolution]:AUTO?`
Example	`:CHP:BAND:AUTO ON` `:CHP:BAND:AUTO?`

RBW Presets

Mode	Preset Value
`LTEAFDD`	Auto
`LTEATDD`	Auto
`MSR`	100 kHz
`NR5G`	Auto
`SA`	Auto
`SRCOMMS`	3.9 kHz
`VMA`	240 kHz
`WCDMA`	240 kHz
`WLAN`	100 kHz

More Information

When **Res BW** is set to **Auto**, the bandwidth selected depends on "RBW Filter Type" on page 258.

Only certain discrete resolution bandwidths are available. The available bandwidths are dependent on **Filter Type** or **EMC Standard**. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

In some PowerSuite measurements, in the LTE-Advanced (both FDD and TDD) and 5G NR modes, when **Res BW** is in **Auto**, the resolution bandwidth is predefined based on the corresponding bandwidth of the single carrier, as shown in the table below. In the Multi-carrier case, the narrowest RBW among the active carriers is used.

LTE-A FDD/TDD Modes

Carrier BW	Auto RBW, kHz
1.4 MHz	20
3 MHz	43
5 MHz	68
10 MHz	150
15 MHz	220
20 MHz	270
200 kHz (NB-IoT in FDD)	10

5G NR Mode

Bandwidth	Auto RBW, kHz
5 MHz	68
10 MHz	150
15 MHz	220
20 MHz	270
25 MHz	360
30 MHz	430
35 MHz	510
40 MHz	560
45 MHz	620
50 MHz	680
60 MHz	820
70 MHz	1000
80 MHz	1100
90 MHz	1300
100 MHz	1500
200 MHz	2700
400 MHz	3000
800 MHz	3000
1600 MHz	3000
2000 MHz	3000

Video BW

Lets you change the instrument post-detection filter (VBW or “Video Bandwidth”) from 1 Hz to 8 MHz in approximately 10% steps. In addition, a wide-open video filter bandwidth may be chosen by selecting 50 MHz. The VBW is annotated at the bottom of the display, in the center.

Normally, **Video BW (Auto)** selects automatic coupling of the Video BW to RBW using the ratio set by **VBW:3 dB RBW**. To decouple the resolution bandwidth, press the **Auto/Man** toggle on **Video BW**, or simply enter a different value for **Video BW**.

When the **Video BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on **Video BW**. This may also be done by pressing "Auto Couple" on page 2242 or by performing a **Preset**.

Remote Command	`[:SENSe]:CHPower:BANDwidth:VIDeo <bandwidth>` `[:SENSe]:CHPower:BANDwidth:VIDeo?`
Example	`:CHP:BAND:VID 2.4 MHz`

	`:CHP:BAND:VID?`
Notes	For numeric entries, the instrument chooses the nearest (arithmetically, on a linear scale, rounding up) available VBW to the value entered. The 50 MHz VBW is defined to mean "wide open" The values shown in this table reflect the conditions after a Mode Preset
Dependencies	Sometimes the displayed **Video BW** is not actually used to process the trace data: When the Average Detector is selected and **Sweep Type** is set to **Swept,** the video bandwidth filter cannot be used, because it uses the same hardware as the Average Detector When the Quasi-Peak, EMI Average or RMS Average detector is selected the VBW is implemented by the digital IF as part of the detector When this is the case, VBW still acts to change the Sweep Time, if "Sweep Time" on page 2125 is in **Auto**, and still affects the data on other traces for which this is not the case
Couplings	Video bandwidth (VBW) is normally coupled to "Res BW" on page 254. If **VBW** is set to **Auto**, then VBW is changed as RBW changes, to maintain the ratio set by **VBW:3 dB RBW** (usually 10:1 for measurements that do not have a **VBW:3 dB RBW** control)
Preset	Auto (unless noted in table below)
State Saved	Saved in instrument state
Min	1 Hz
Max	50 MHz
Annunciation	A "#" mark appears before "VBW" in the annotation when it is not coupled
Annotation	In the bottom center of the screen, "VBW <value> <units>" indicates the current video bandwidth value. Note that for some detectors this is not the value actually used for VBW (see above)
Backwards Compatibility Notes	For backwards compatibility, this command supports both the `BANDwidth` and `BWIDth` forms

Auto Function

Remote Command	`[:SENSe]:CHPower:BANDwidth:VIDeo:AUTO ON | OFF | 1 | 0` `[:SENSe]:CHPower:BANDwidth:VIDeo:AUTO?`
Example	`:CHP:BAND:VID:AUTO OFF` `:CHP:BAND:VID:AUTO?`
Preset	`ON`

VBW Presets

Unless noted in the table below, the Preset value of VBW is **Auto**.

Mode	Preset Value
WCDMA	2.40 MHz

RBW Filter Type

Selects the type for the resolution bandwidth filters. Historically, the Res BW filters in HP/Agilent/Keysight spectrum instruments were Gaussian filters, specified using the –3 dB bandwidth of the filter. That is, a 10 MHz Res BW filter was a Gaussian shape with its –3 dB points 10 MHz apart. In X-Series, the **RBW Filter BW** menu lets you choose between a Gaussian and Flat Top filter shape, for varying measurement conditions.

Filter Type	SCPI Example
Gaussian	`:BAND:SHAP GAUS`
Flattop	`:BAND:SHAP FLAT`

Remote Command	`[:SENSe]:CHPower:BANDwidth:SHAPe GAUSsian | FLATtop` `[:SENSe]:CHPower:BANDwidth:SHAPe?`
Example	`:CHP:BAND:SHAP GAUS` `:CHP:BAND:SHAP?`
Notes	`GAUSsian`= Gaussian `FLATtop` = Flattop We use `SHAPe` instead of `TYPE` (even though the control name uses Type) because `TYPE` is used for backwards compatibility
Preset	"Auto Couple" on page 2242 selects the preset value
State Saved	Saved in instrument state
Annotation	The annotation under RBW in the bottom left of the screen shows the type of filter or bandwidth that is being used. The following examples illustrate this:

–3 dB (Normal) filter BW	Res BW 300 Hz
–6 dB filter BW	Res BW (–6 dB) 422 Hz
Noise filter BW	Res BW (Noise) 317 Hz
Impulse filter BW	Res BW (Impulse) 444 Hz
CISPR filter BW	Res BW (CISPR) 200 Hz
MIL filter BW	Res BW (MIL) 1 kHz
Flattop filter type	Res BW (Flattop) 300 Hz

Backwards Compatibility SCPI	`[:SENSe]:CHPower:BWIDth:SHAPe`

3.2.5 Display

Lets you configure display items for the current Mode, Measurement View or Window.

3.2.5.1 Meas Display

Contains controls for setting up the display for the current Measurement, View or Window.

Bar Graph On/Off

Turns the Bar Graph On or Off.

Remote Command	`:DISPlay:CHPower:WINDow[1]:BGRaph ON | OFF | 1 | 0` `:DISPlay:CHPower:WINDow[1]:BGRaph?`
Example	`:DISP:CHP:WIND:BGR ON` `:DISP:CHP:WIND:BGR?`
Preset	`OFF`
State Saved	Saved in instrument state
Range	`ON|OFF`
Backwards Compatibility SCPI	`:DISPlay:CHPower:VIEW[1]:WINDow[1]:BGRaph`

Carrier Frequency Type

Set the carrier frequency display type:

- `OFFSet`- The carrier center frequencies are displayed as offsets from Carrier Ref Freq
- `ABSolute`- The carrier center frequencies are displayed as absolute frequencies

Remote Command	`:DISPlay:CHPower:VIEW:WINDow:CINFormation:FREQuency OFFSet | ABSolute` `:DISPlay:CHPower:VIEW:WINDow:CINFormation:FREQuency?`
Example	`:DISP:CHP:VIEW:WIND:CINF:FREQ ABS` `:DISP:CHP:VIEW:WIND:CINF:FREQ?`
Dependencies	Only available in MSR, LTE-Advanced FDD/TDD and 5G NR Modes
Preset	`OFFSet`

State Saved	Saved in instrument state
Range	`OFFSet|ABSolute`

3.2.5.2 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	`:DISPlay:GRATicule[:STATe] OFF | ON | 0 | 1` `:DISPlay:GRATicule[:STATe]?`
Example	`:DISP:GRAT OFF`
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	`ON`
State Saved	Saved in instrument state

Backwards Compatibility SCPI	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF | ON | 0 | 1`
	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?`
	This command is accepted for backwards compatibility with older instruments, but the `WINDow`, `TRACe` and `GRID` parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When `OFF`, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	`:DISPlay:ANNotation:SCReen[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:SCReen[:STATe]?`
Example	`:DISP:ANN:SCR OFF`
Dependencies	Grayed-out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`

Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with ….

Remote Command	`:DISPlay:ANNotation:TRACe[:STATe] ON | OFF | 1 | 0` `:DISPlay:ANNotation:TRACe[:STATe]?`
Example	`:DISP:ANN:TRAC OFF`
Preset	`OFF`
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	`:DISPlay:ACTivefunc[:STATe] ON | OFF | 1 | 0` `:DISPlay:ACTivefunc[:STATe]?`
Example	`:DISP:ACT OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	`:DISPlay:ANNotation:MBAR[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:MBAR[:STATe]?`
Example	`:DISP:ANN:MBAR OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. Theare three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor :SYSTem:PRESet enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are using either the `:SYSTem:KLOCk` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is `OFF`, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

Name	Command
Select User View	`:DISPlay:VIEW:ADVanced:SELect`
Rename User View	`:DISPlay:VIEW:ADVanced:REName`
Delete User View	`:DISPlay:VIEW:ADVanced:DELete`

Name	Command
Create User View	`:DISPlay:VIEW:ADVanced:NAME`
Select Screen	`:INSTrument:SCReen:SELect`
Delete Screen	`:INSTrument:SCReen:DELete`
Delete All But This Screen	`:INSTrument:SCReen:DELete:ALL`
Add Screen	`:INSTrument:SCReen:CREate`
Rename Screen	`:INSTrument:SCReen:REName`
Sequencer On/Off	`:SYSTem:SEQuencer`

Remote Command	`:DISPlay:ENABle OFF | ON | 0 | 1` `:DISPlay:ENABle?`
Example	`:DISP:ENAB OFF`
Couplings	`:DISP:ENAB OFF` turns Backlight `OFF` and `:DISP:ENAB ON` turns Backlight `ON`, but changing Backlight settings does *not* change the state of `:DISP:ENAB`
Preset	`ON` Set by `:SYST:DEF MISC`, but not affected by `*RST` or `:SYSTem:PRESet`
State Saved	Not saved in instrument state
Backwards Compatibility Notes	`:SYST:PRES` no longer turns on `:DISPlay:ENABle` as it did in legacy analyzers

3.2.5.3 View

Contains controls for selecting the current **View**, and for editing User Views.

View

See "Views" on page 206.

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:SELect <alphanumeric>` `:DISPlay:VIEW:ADVanced:SELect?`
Example	Select Baseband as the current View `:DISP:VIEW:ADV:SEL “Baseband”`

Notes	You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command
	For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	because “Trace Zoom” is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu
	You *cannot* use the legacy View parameter (which in this case would be `TZOom`) with `:DISP:VIEW:ADV:SEL`
	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	`:DISP:VIEW:ADV:SEL "TRACE ZOOM"`
	If the specified view is not a valid View, the query returns the error message “-224, Illegal parameter value; View with the name <alphanumeric> does not exist”
	If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated

Backwards Compatibility SCPI	The legacy node `:DISPlay:VIEW[:SELect]` is retained for backwards compatibility, but it only supports predefined views

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a “User View”.

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	`:DISPlay:VIEW:ADVanced:NAME <alphanumeric>`
Example	`:DISP:VIEW:ADV:NAME “Baseband”` Creates a new View named `Baseband` from the current View, and selects it as the current View
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case

	If `<alphanumeric>` name already exists as a View, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; User View SCPI cannot be used while Display is disabled" is generated

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View's name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	`:DISPlay:VIEW:ADVanced:REName <alphanumeric>`
Example	`:DISP:VIEW:ADV:REN "Baseband"`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` specifying the new name is already present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot rename a Predefined View" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete`
Example	`:DISP:VIEW:ADV:DEL`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case

	If the `<alphanumeric>` is not present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> does not exist" is generated If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot delete a Predefined View" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete:ALL`
Example	`:DISP:VIEW:ADV:DEL:ALL`
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SELect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:CATalog?`
Example	`:DISP:VIEW:ADV:CAT?`
Notes	Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for *all* the Views, including User Views, available for the current Measurement Example: `"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"` No distinction is made between Predefined and User Views If you switch measurements with the display disabled (via `:DISP:ENAB OFF`), then query the list of available Views, the result is undefined

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:USER:CATalog?`
Example	`:DISP:VIEW:ADV:USER:CAT?`
Notes	Returns a quoted string of the available User Views for the current measurement, separated by commas. Example: `"Baseband,myView1,yourView1"` If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 2211), then query the list of available Views, the result is undefined

3.2.6 Frequency

Contains controls that allow you to control the frequency and channel parameters of the instrument.

Some features in the **Frequency** menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called "Meas Global" and are unaffected by "Meas Preset" on page 286. For example, **Center Frequency** is the same for all measurements — it does not change as you change measurements.

3.2.6.1 Settings

Contains controls that pertain to the X axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Carrier Reference Frequency

Sets **Carrier Reference Frequency**. The center frequencies of carriers are defined as offset frequency from this value. This reference frequency is also the reference of carrier configuration preset.

Because LTE-A, MSR and 5G NR measurements often deal with multiple carriers with distinct bandwidths, the simple **Center Frequency** parameter used in most measurements does not apply here. Instead, **Carrier Reference Frequency** is the key parameter. This must be distinct from the **Center Frequency** parameter used in other measurements, because Center Frequency can be a global parameter. It makes no sense for **Carrier Reference Frequency** to use the global value.

In LTE-A and 5G NR Modes, if the following conditions are satisfied at the same time:

- **Number of Component Carriers** is 1
- **Center Freq Offset** is 0 Hz
- **Center Frequency** mode is Auto

then **Center Frequency** is equivalent to **Carrier Ref Frequency**. When **Center Frequency** changes in such conditions, its mode remains **Auto**, and **Carrier Reference Frequency** changes to the same value. The main purpose of this coupling is to maintain backwards compatibility with legacy LTE/LTE TDD Modes, in which `:SENSe:FREQuency:CENTer` is used to set up the frequency of the measurement.

See "More Information" on page 268

Remote Command	For LTE-A, 5G NR Modes
	`[:SENSe]:CCARrier:REFerence <freq>`
	`[:SENSe]:CCARrier:REFerence?`
	For MSR Mode
	`[:SENSe]:CARRier:REFerence <freq>`
	`[:SENSe]:CARRier:REFerence?`

Example	For LTE-A, 5G NR Modes
	`:CCAR:REF 2GHz`
	For MSR Mode
	`:CARR:REF 2GHz`

Dependencies	Only available in LTE-A FDD/TDD, 5G NR and MSR Modes
Preset	`1GHz`
State Saved	Saved in instrument state
Min/Max	Depends on instrument minimum center frequency. Same as **Center Frequency**

More Information

In most applications, **Center Frequency** is generally the location of the carrier center, and thus plays a very important role. However, in LTE-Advanced TDD/FDD Modes, the measurements are done based on carrier center frequencies and its bandwidths, both of which are calculated or obtained according to the carriers' configuration.

The **Center Frequency** defined here is only for the Monitor Spectrum, IQ Waveform and CCDF measurements, because these three are general type measurements and focus on a certain frequency range, which may be the entire BS RF bandwidth, a frequency range of one of the component carriers or a range far away from the component carriers to see spurious. The **Center Frequency** in these three measurements has a different meaning, therefore it should be a separate setting from **Carrier Reference Frequency**.

Carrier center frequencies are defined using offsets from **Carrier Reference Frequency**, which determines absolute frequency locations, and which can be set as both absolute and relative frequency from the carrier reference frequency.

Since **Center Frequency** is only used in those three measurements, Monitor Spectrum, IQ Waveform and CCDF, this control only appears on the **Frequency** menu of these measurements.

Span

Changes the displayed frequency range symmetrically about the center frequency. While adjusting **Span**, **Center Frequency** is held constant, which means that both Start Frequency and Stop Frequency will change.

If **Span** is set to a value greater than the maximum allowable span of the instrument, an error message is generated indicating the data is out of range and was clipped to upper limit.

The default (and minimum) **Span** is calculated using the number of carriers and the carrier width where;

Span = (Upper Carrier Freq + (max offset IBW * (1 + alpha)) / 2) – (Lower Carrier Freq – (max offset IBW * (1 + alpha)) / 2)

If the RRC Filter is on, then span is increased by a factor of 1 + Filter Alpha.

See "Span Presets" on page 271

Remote Command	`[:SENSe]:CHPower:FREQuency:SPAN <freq>` `[:SENSe]:CHPower:FREQuency:SPAN?`
Example	`:CHP:FREQ:SPAN 10 MHz` `:CHP:FREQ:SPAN?`
Dependencies	If the electrical attenuator is enabled, any attempt to set Span such that the Stop Frequency would be >3.6 GHz results in an error In instruments with an RF Preselector, such as MXE, you cannot sweep across the band break at 3.6 GHz while the RF Preselector is on in Continuous sweep, as there is a mechanical switch which bypasses the RF Preselector above 3.6 GHz. See the Stop Frequency control description for details of this limitation For MSR Mode, this control is not shown For WLAN 802.11ac (80 MHz + 80 MHz), the control is not enabled, and its value is coupled with the spacing between the center frequencies of the two carriers Span = | Center Frequency 1 – Center Frequency 2| + Integ BW + 40 MHz Margin

	When the calculated span is over 1 GHz, it is still coupled to its maximum value, which is 1 GHz
Couplings	**Span** affects "Res BW" on page 254, Sweep Time, FFT & Sweep choice (including FFT Width, Phase Noise Optimization and ADC Dither auto couplings) Any value of **Center Frequency** or **Span** that is within the frequency range of the instrument is allowed *when* the value is being set through the front panel numeric keypad or the SCPI command. The other parameter is forced to a different value if needed, to keep the Start and the Stop Frequencies within the instrument's frequency range When using the knob or the step up/down keys or the `UP |DOWN` keywords in SCPI, the value that is being changed, that is, **Center Frequency** or **Span**, is limited so that the other parameter is not forced to a new value When **Res BW** is set to **Auto**, the resolution bandwidth is auto-coupled to span. The ratio of span /RBW is approximately 106:1. When **Res BW** is set to **Man**, bandwidths are entered by the user, and these bandwidths are used regardless of other instrument settings Since **Span** is coupled to **Integ BW** in the factory default condition, if you change the Integ BW setting, the span setting changes by a proportional amount until a limit value is reached. However, the span can be individually set. The minimum value of the span is coupled with the integration bandwidth **Span** cannot be set less than the **Integ BW** value. When **Span** is changed, the ratio of Span/Integ BW is set, and retained when Integ BW is changed
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See "Span Presets" on page 271
State Saved	Saved in instrument state
Min	100 Hz In 5GNR, LTEAFDD, and LTEATDD Modes, this value is the minimum value required for the measurement, which depends on the Component Carrier configuration
Max	Depends on instrument maximum frequency, mode, measurement, and selected input. See "Span Presets" on page 271 If the knob or step keys are being used, depends on the value of the other three interdependent parameters Center Frequency, Start Frequency, Stop Frequency
Annunciation	Data out of range, value clipped to upper limit
Annotation	Span <value> appears on the first line of the annotation in the lower right corner of display

LTE, 5G NR Modes only:

Remote Command	`[:SENSe]:CHPower:FREQuency:SPAN:AUTO ON | OFF | 1 | 0` `[:SENSe]:CHPower:FREQuency:SPAN:AUTO?`
Example	`:CHP:FREQ:SPAN:AUTO OFF` `:CHP:FREQ:SPAN:AUTO?`
Notes	The span value is adjusted when the relevant carrier parameters such as bandwidth, integration bandwidth, number of component carriers etc., are changed, whatever the span state (**Auto** or **Man**) When in **Man** state, if the input value is less than the required sum of total integration bandwidths and gaps of the multi-carriers, the required span value is set
Dependencies	Only available in LTE/LTE-Advanced FDD/TDD Modes and 5G NR Mode, CHP measurement

Preset	`ON`
State Saved	Saved in instrument state
Range	`Auto`|`Man`

Span Presets

The following table provides the Max Span, for the various frequency options:

Freq Option	Max Span (can't set higher than this)
503 (all but CXA)	3.7 GHz
503, F03 (CXA, CXA-m)	3.08 GHz
507 (all but CXA)	7.1 GHz
507 (CXA, CXA-m)	7.575 GHz
508 (all but MXE)	8.5 GHz
508 (MXE)	8.5 GHz
513, F13	13.8 GHz
526 (all but CXA and MXE)	27.0 GHz
526 (MXE)	27.0 GHz
526, F26 (CXA, CXA-m)	26.55 GHz
544	44.5 GHz
550	52 GHz
F06 (VXT models M9410A/11A)	5.75 GHz
F06 & EP6 (VXT models M9410A/11A)	6.27 GHz
F06 & LFE & EP6 (VXT models M9411A)	6.5999935 GHz
M9415A-F06	6.27 GHz
M9415A-F08	8.27 GHz
M9415A-F12	12.57 GHz

Input 2:

Model	Max Span (can't set higher than this)
CXA opt C75	1.58 GHz
MXE	1.000025 GHz

Note that if you are in External Mixing, the maximum Span will be equal to the Maximum Stop Frequency – Minimum Start Frequency for the currently selected mixer.

Span Presets by Mode

Mode	Radio Std	Preset Value
SA		3 MHz
WCDMA		7.5 MHz
LTE		7.5 MHz
LTETDD		7.5 MHz
5G NR		150 MHz
WLAN	802.11a/g(OFDM/DSSS-OFDM)	30 MHz
	802.11b	37.5 MHz
	802.11n/ac/ax/be 20MHz	30 MHz
	802.11n/ac/ax/be 40MHz	60 MHz
	802.11n/ac/ax/be 80 MHz	120 MHz
	802.11n/ac/ax/be 160 MHz	240 MHz
	802.11n/ac/ax/be 80 MHz + 80 MHz	360 MHz
	802.11be 320 MHz	480MHz
	802.11be 160MHz + 160MHz	440MHz

CF Step

Changes the step size for **Center Frequency** and start and stop frequency functions. Once a step size has been selected and the center frequency function is active, the step keys (and the `UP|DOWN` parameters for **Center Frequency** from remote commands) change the center frequency by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the instrument.

Note that the start and stop frequencies also step by the **CF Step** value.

Remote Command	`[:SENSe]:FREQuency:CENTer:STEP[:INCRement] <freq>` `[:SENSe]:FREQuency:CENTer:STEP[:INCRement]?`

Example	Increase the current center frequency value by 500 MHz:
	`:FREQ:CENT:STEP 500 MHz`
	`:FREQ:CENT UP`

Notes	Preset and Max values depend on Hardware Options
Dependencies	If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the Up-arrow key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning Not available in the MSR, LTE-A FDD/TDD and 5G NR Modes
Couplings	When auto-coupled, the center frequency step size is set to 10% of the span
Preset	Auto
State Saved	Saved in instrument state
Min/Max	–/+ (the maximum frequency of the instrument) That is, 27 GHz max freq instrument has a CF step range of ±27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Status Bits/OPC dependencies	non-overlapped

Auto Function

Remote Command	`[:SENSe]:FREQuency:CENTer:STEP:AUTO OFF | ON | 0 | 1` `[:SENSe]:FREQuency:CENTer:STEP:AUTO?`
Example	`:FREQ:CENT:STEP:AUTO ON` `:FREQ:CENT:STEP:AUTO?`

Full Span (Remote Command Only)

Changes the span to show the full frequency range of the instrument. It maximizes the span within a range not changing the center frequency.

Remote Command	`[:SENSe]:CHPower:FREQuency:SPAN:FULL`
Example	`:CHP:FREQ:SPAN:FULL`
Couplings	Selecting full span changes the measurement span value

3.2.7 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, **Marker** selects marker 1, sets it to Normal and places it at the center of the display. If the selected marker is Off, it is set to Normal and placed it at the center of the screen on the trace determined by the **Marker Trace** rules.

3.2.7.1 Select Marker

Specifies the *selected marker*. The term “selected marker” is used throughout this document to specify which marker will be affected when you change marker settings, perform a Peak Search, etc.

This control appears above the menu panel, indicating that it applies to all controls in the **Marker** menu panels. If you select a tab whose controls do *not* depend on the selected marker (for example, Counter), then this control is blanked.

For any menu that includes **Select Marker**, the first control is always **Marker Frequency**.

Notes	The selected marker is remembered even when not in the Marker menu and is used if a Search is done or a Band Function is turned on or for Signal Track or Continuous Peak
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for **Normal, Delta** and **Fixed** markers

3.2.7.2 Settings

The controls on this tab include the Marker active function and a radio button selection of the marker control mode (**Normal**, **Delta**, or **Off**) for the selected marker, as well as additional functions that help you use markers.

Marker Frequency

Sets the marker X Axis value in the current marker X Axis Scale unit. It has no effect if the control mode is **Off,** but is the SCPI equivalent of entering an X value if the control mode is **Normal** or **Delta**.

Remote Command	`:CALCulate:CHPower:MARKer[1]|2|…|12:X <freq>` `:CALCulate:CHPower:MARKer[1]|2|…|12:X?`
Example	`:CALC:CHP:MARK3:X 0` `:CALC:CHP:MARK3:X?`
Notes	If no suffix is sent, uses the fundamental units for the current marker X Axis Scale. If a suffix is sent that does not match the current marker X Axis Scale unit, an error “Invalid suffix” is generated The query returns the marker’s absolute X Axis value if the control mode is **Normal**, or the offset from the marker’s reference marker if the control mode is **Delta.** The query is returned in the fundamental units for the current marker X Axis scale: Hz for **Frequency** and Inverse Time, seconds for Period and Time

Preset	After a preset, all markers are turned `OFF`, so Marker X-Axis Value query returns Not A Number (`NAN`)
State Saved	Saved in instrument state
Min/Max	–/+9.9E+37
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Marker X Axis Position (Remote Command Only)

Sets the marker X-Axis Scale position in trace points. This setting has no effect if the control mode is **Off**, but is the SCPI equivalent of entering a value if the control mode is **Normal** or **Delta**, except in trace points rather than X-Axis Scale units. The entered value is immediately translated into the current X-Axis Scale units for setting the value of the marker.

Remote Command	`:CALCulate:CHPower:MARKer[1]|2|…|12:X:POSition <real>` `:CALCulate:CHPower:MARKer[1]|2|…|12:X:POSition?`
Example	`:CALC:CHP:MARK10:X:POS 0` `:CALC:CHP:MARK10:X:POS?`
Notes	The query returns the marker's absolute X-Axis value in trace points if the control mode is **Normal**, or the offset from the marker's reference marker in trace points if the control mode is **Delta**. The value is returned as a real number, not an integer, corresponding to the translation from X-Axis Scale units to trace points . When a marker is turned on, it is placed at the center of the screen on the trace. Therefore, the default value depends on instrument condition. If the marker is **Off**, the response is Not A Number
Preset	After a preset, all markers are turned **Off**, so the query returns Not A Number (`NAN`)
State Saved	Saved in instrument state
Min/Max	–/+9.9E+37

Marker Y Axis Value (Remote Query only)

Returns the marker Y Axis value in the current marker Y-Axis unit.

Remote Command	`:CALCulate:CHPower:MARKer[1]|2|…|12:Y?`
Example	`:CALC:CHP:MARK11:Y?`
Notes	Returns the marker Y-Axis result if the control mode is **Normal** or **Delta** If the marker is **Off**, then the response is Not A Number
Preset	Result dependent on Markers setup and signal source
State Saved	No
Backwards Compatibility SCPI	`:CALCulate:CHPower:MARKer[1]|2|…|12:FUNCtion:RESult?`

Marker Mode

Sets the marker control mode to `POSition` (**Normal**), `DELTa`, or `OFF`. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is `OFF`, pressing **Marker** sets it to `POSition` and places it at the center of the screen on the trace determined by the **Marker Trace** rules. At the same time, **Marker X Axis Value** appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is `OFF`, there is no active function, and the active function is turned off.

Remote Command	`:CALCulate:CHPower:MARKer[1]|2|…|12:MODE POSition | DELTa | OFF` `:CALCulate:CHPower:MARKer[1]|2|…|12:MODE?`
Example	`:CALC:CHP:MARK3:MODE POS` `:CALC:CHP:MARK3:MODE?`
Preset	`OFF`
State Saved	Saved in instrument state
Range	`POSition|DELTa|OFF`
Annotation	Mkr # <X value> and <Marker value> upper right on graph When Marker Trace is Polar in WCDMA mode: Mkr # <Chip Value (RHO & QPSKEVM)/Symbol Value (CDP)>, <X value> and <Y value> upper right on graph

Backwards Compatibility SCPI Commands

Sets or queries the state of a marker. Setting a marker that is `OFF` to `ON` (1) puts it in `POSition` (**Normal**) mode and places it at the center of the screen.

Example	`:CALC:CHP:MARK3:STAT ON` `:CALC:CHP:MARK3:STAT?`
Preset	`OFF`
State Saved	Saved in instrument state
Range	`OFF|ON`
Backwards Compatibility SCPI	`:CALCulate:CHPower:MARKer[1]|2|…|12:STATe OFF | ON | 0 | 1` `:CALCulate:CHPower:MARKer[1]|2|…|12:STATe?`

Delta Marker (Reset Delta)

This control has the same effect as pressing **Delta** in "Marker Mode" on page 276. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

Marker Settings Diagram

Lets you configure the Marker system using a visual utility.

All Markers Off

Turns off all markers.

Remote Command	`:CALCulate:CHPower:MARKer:AOFF`
Example	`:CALC:CHP:MARK:AOFF`

3.2.7.3 Peak Search

The controls on this tab let you move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with "Marker Delta" on page 278.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a peak search.

Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a peak search.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as "Marker Frequency" on page 274 in the **Settings** tab.

Peak Search

Moves the selected marker to the trace point that has the maximum Y-Axis value for that marker’s trace.

NOTE Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a peak search.

Remote Command	`:CALCulate:CHPower:MARKer[1]|2|…|12:MAXimum`

Example	`:CALC:CHP:MARK2:MAX`
	`:SYST:ERR?`
	can be used to query the errors to determine if a peak is found. Following an unsuccessful search, the message “No peak found” is returned

Notes	Sending this command selects the subopcoded marker In W-CDMA Mode, this command does not work when the selected marker is located on the polar trace. In this case, the command is ignored

Marker Delta

Pressing this button has the same effect as pressing **Delta** in "Marker Mode" on page 276 on the **Settings** tab. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the delta to zero.

The control is duplicated here to allow you to conveniently perform a peak search and change the marker’s control mode to **Delta** without having to access two separate menus.

3.2.7.4 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as "Marker Frequency" on page 274 in the **Settings** tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the “reference marker” for that marker. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	`:CALCulate:CHPower:MARKer[1]|2|…|12:REFerence <integer>` `:CALCulate:CHPower:MARKer[1]|2|…|12:REFerence?`
Example	`:CALC:CHP:MARK:REF 5` `:CALC:CHP:MARK:REF?`
Notes	Causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded the value is clipped A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: “Settings conflict; marker cannot be relative to itself” When queried a single value is returned (the specified marker numbers relative marker)
Couplings	If the reference marker is **Off**, it is turned on in **Normal** mode at the delta marker location
Preset	The preset default “Relative To” marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then its default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by using **Restore Mode Defaults.** Not reset by **Marker Off**, **All Markers Off**, or **Preset**
State Saved	Saved in instrument state. Not affected by Marker Off, and hence not affected by Preset or power cycle
Min	1
Max	12
Annunciation	Appears in the marker label of a **Delta** marker

Marker Trace

Selects the trace on which you want your marker placed. A marker is associated with one and only one trace. This trace is used to determine the placement, result, and X-Axis Scale of the marker. All markers have an associated trace; it is from that trace that they determine their attributes and behaviors, and it is to that trace that they go when they become **Normal** or **Delta** markers.

Specifying a **Marker Trace** manually or with this command associates the marker with the specified trace. If the marker is not **Off**, it moves the marker from the trace it was on to the new trace. If the marker is **Off**, it stays off but is now associated with the specified trace.

The query returns the number of the trace on which the marker is currently placed.

Remote Command	`:CALCulate:CHPower:MARKer[1]|2|…|12:TRACe 1 | 2 | 3` `:CALCulate:CHPower:MARKer[1]|2|…|12:TRACe?`
Example	`:CALC:CHP:MARK2:TRAC 2` `:CALC:CHP:MARK2:TRAC?`
Notes	A marker may be placed on a blanked and/or inactive trace, even though the trace is not visible and/or updating An application may register a trace name to be displayed on the control instead of a trace number

Couplings	The state of **Marker Trace** is not affected by "Auto Couple" on page 2242 Sending the remote command causes the addressed marker to become selected
Preset	1
State Saved	Saved in instrument state

Marker Settings Diagram

Lets you configure the **Marker** system using a visual utility. It is the same as "Marker Settings Diagram" on page 277 in the **Settings** tab.

3.2.8 Meas Setup

Contains functions for setting up the measurement parameters and also contains functions for setting up parameters global to all measurements in the Mode.

3.2.8.1 Settings

Contains frequently used **Meas Setup** functions to which you will want the fastest access.

Avg/Hold Number

Specifies the number of measurement averages used to calculate the measurement result. The average is displayed at the end of each sweep. After the specified number of average counts, the averaging mode (terminal control) setting determines the averaging action.

Remote Command	`[:SENSe]:CHPower:AVERage:COUNt <integer>` `[:SENSe]:CHPower:AVERage:COUNt?`
Example	`:CHP:AVER:COUN 15` `:CHP:AVER:COUN?`
Preset	SA, WLAN: 10 WCDMA, LTEAFDD, LTEATDD, 5G NR, MSR: 200
State Saved	Saved in instrument state
Min/Max	1 / 10000
Annotation	The average count is displayed in the measurement bar on the front panel display. The annotation appears in the format `n/N` where `n` is the current average and `N` is the average count

Averaging On/Off

Turns averaging on or off for this measurement.

NOTE In this measurement, the **Average Type** is preset to the `Log-Pwr Avg (Video)` method. Other averaging methods are not available.

Remote Command	`[:SENSe]:CHPower:AVERage[:STATe] ON | OFF | 1 | 0` `[:SENSe]:CHPower:AVERage[:STATe]?`
Example	`:CHP:AVER ON` `:CHP:AVER?`
Preset	`ON`
State Saved	Yes
Range	`ON|OFF`

Avg Mode

Allows you to select the type of termination control used for the averaging function. This determines the averaging action after the specified number of data acquisitions (average count) is reached. Options are:

- `EXPonential`: The measurement averaging continues using the specified number of averages to compute each exponentially-weighted averaged value. The average is displayed at the end of each sweep
- `REPeat`: The measurement resets the average counter each time the specified number of averages is reached

Remote Command	`[:SENSe]:CHPower:AVERage:TCONtrol EXPonential | REPeat` `[:SENSe]:CHPower:AVERage:TCONtrol?`
Example	`:CHP:AVER:TCON EXP` `:CHP:AVER:TCON?`
Preset	`EXP`
State Saved	Yes
Range	`EXPonential|REPeat`

Integ BW

Specifies the range of integration used in calculating the power in the channel. The integration bandwidth (IBW) is displayed on the trace as two markers connected by an arrow.

Remote Command	`[:SENSe]:CHPower:BANDwidth:INTegration <bandwidth>` `[:SENSe]:CHPower:BANDwidth:INTegration?`
Example	`:CHP:BAND:INT 10MHz` `:CHP:BAND:INT?`
Dependencies	For LTE-Advanced FDD/TDD, 5G NR and MSR Modes, this control is not shown
Couplings	The minimum value of the span is coupled with Integ BW When you change Integ BW, the span changes accordingly by keeping the same ratio of Span/Integ BW

Preset

Mode	Radio Std	Integ BW
SA		2 MHz
WCDMA		5 MHz
LTEAFDD, LTEATDD		5 MHz
WLAN	802.11a/g(OFDM/DSSS-OFDM)	20 MHz
	802.11b	25 MHz
	802.11n/ac/ax/be (20MHz)	20 MHz
	802.11n/ac/ax/be (40MHz)	40 MHz
	802.11n/ac/ax/be (80MHz)	80 MHz
	802.11ax/be (80 MHz + 80 MHz)	80 MHz
	802.11ac/ax/be (160 MHz)	160 MHz
	802.11be (160 MHz + 160MHz)	160 MHz
	802.11be (320MHz)	320 MHz

State Saved	Saved in instrument state
Min/Max	100 Hz / Hardware Maximum Span
Backwards Compatibility SCPI	`[:SENSe]:CHPower:BWIDth:INTegration`

PSD Unit

Sets the unit bandwidth for Power Spectral Density. The available units are dBm/Hz (DBMHZ) and dBm/MHz (DBMMHZ).

Remote Command	`:UNIT:CHPower:POWer:PSD DBMHZ | DBMMHZ` `:UNIT:CHPower:POWer:PSD?`
Example	`:UNIT:CHP:POW:PSD DBMMHZ` `:UNIT:CHP:POW:PSD?`

Couplings	When the PSD unit is changed, the response to `:MEAS|READ|FETCH:CHP1?` also changes by the PSD unit basis (either dBm/Hz or dBm/MHz)
Preset	WLAN mode or SA mode with WLAN radio standard: `DBMMHZ` Otherwise: `DBMHZ`
State Saved	Saved in instrument state
Range	dBm/Hz | dBm/MHz

IF Gain

Sets **IF Gain** to Auto, Low Gain or High Gain. These settings affect sensitivity and IF overloads.

Remote Command	`[:SENSe]:CHPower:IF:GAIN[:STATe] ON | OFF | 1 | 0` `[:SENSe]:CHPower:IF:GAIN[:STATe]?`
Example	`:CHP:IF:GAIN ON` `:CHP:IF:GAIN?`
Notes	`ON` = high gain `OFF` = low gain
Dependencies	The IF Gain controls (FFT IF Gain and Swept IF Gain) have no effect when the U7227A USB Preamplifier is connected. This is not annotated or reflected on any control; there are no controls grayed out nor any SCPI locked out. The instrument simply behaves as though both FFT IF Gain and Swept IF Gain are set to Low regardless of the setting on the controls Not available in VXT model M9421A
Preset	`OFF`
State Saved	Saved in instrument state
Range	Low Gain | High Gain

Auto Function

Remote Command	`[:SENSe]:CHPower:IF:GAIN:AUTO[:STATe] ON | OFF | 1 | 0` `[:SENSe]:CHPower:IF:GAIN:AUTO[:STATe]?`
Example	`:CHP:IF:GAIN:AUTO ON` `:CHP:IF:GAIN:AUTO?`
Couplings	Auto sets IF Gain to High Gain if the input attenuator is set to 0 dB, or if the preamp is turned on and the frequency range is under 3.6 GHz For other conditions, Auto sets IF Gain to Low Gain
Preset	`OFF`

Spur Avoidance

Because VXT models M9410A/11A/15A are direct-conversion (zero-IF) receivers, feedthrough leakage from the local oscillator appears as a spurious signal (spur) at the center frequency. The **Spur Avoidance** function is provided to eliminate this spur, at the expense of some measurement speed.

When **Spur Avoidance** is **Enabled** (the default), the instrument uses a software algorithm to remove this spur from the displayed measurement data, but the algorithm only operates under certain conditions. Specifically, it only operates in the multiple capture case.

You can disable this function to speed up your measurement by setting **Spur Avoidance** to **Disabled** (`OFF`).

Note that when **Spur Avoidance** is not in effect, either because you have disabled it or because you are not in multiple capture, the following warning message will appear in the status bar:

```
Settings Alert;Spur Avoidance Off
```

This is to alert you that measurement accuracy might be negatively impacted.

Remote Command	`[:SENSe]:CHPower:SAVoid[:STATe] ON | OFF | 0 | 1` `[:SENSe]:CHPower:SAVoid[:STATe]?`
Example	`:CHP:SAV ON` `:CHP:SAV?`
Dependencies	Only appears in VXT models M9410A/11A/15A
Preset	`OFF`
State Saved	Saved in instrument state
Range	`ON|OFF`

Meas Setup Summary Table

Lets you view and access many of the parameters in the **Meas Setup** menus on one screen.

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "Measurement-Specific Details" on page 285 below.

Remote Command	`:COUPle ALL`
Example	`:COUP ALL`
Backwards Compatibility SCPI	`:COUPLE ALL | NONE`
Backwards Compatibility Notes	`:COUP:NONE` puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is *not* recommended for making measurements or new designs

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple***does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all measurement parameters to their default values.

Remote Command	`:CONFigure:CHPower`
Example	`:CONF:CHP`

3.2.8.2 Radio

Contains controls to select link direction.

Direction

Specifies whether the LTE-Advanced signal is an uplink signal or a downlink signal.

The choice of link direction determines the Sync/Format, Chan Profile and Time. Advanced menus all change based on the link direction selected. Also, since downlink and uplink signals use OFDMA and SC-FDMA respectively, the list of trace results available and the default traces presented change based on the link direction parameter.

Remote Command	`[:SENSe]:RADio:STANdard:DIRection DLINk | ULINk` `[:SENSe]:RADio:STANdard:DIRection?`
Example	`:RAD:STAN:DIR DLIN`
Couplings	TDD: Changing direction affects the sync source of periodic trigger source or gate source If Direction is uplink, the sync source is RF burst If Direction is downlink, the sync source is External1 If direction is downlink, the menu Measure PRACH/SRS is disabled and the value is off FDD/TDD: Changing Direction affects many other modulation analysis setup parameters
Preset	DLIN ULIN on E6640A DLIN on E6650A
State Saved	Yes
Range	Downlink|Uplink For E6640A, Direction is restricted to Uplink only, Downlink is not selectable For E6650A, Direction is restricted to Downlink only, Uplink is not selectable

3.2.8.3 Component Carriers

Contains settings that let you configure the analyzer to match the component carriers in your LTE-A signal.

Number of Component Carriers

Specifies how many component carriers are included in LTE-Advanced TDD/FDD measurements. Each component carrier complies with the LTE specifications.

LTE-Advanced TDD/FDD supports a maximum of five component carriers, so the maximum transmission bandwidth is up to 100 MHz.

Remote Command	`[:SENSe]:CCARrier:COUNt <integer>` `[:SENSe]:CCARrier:COUNt?`
Example	`:CCAR:COUN 1` `:CCAR:COUN?`
Notes	The max number of Component carriers can be set greater than one with 9080B/9082B-2FP license
Preset	1

State Saved	Yes
Min	1
Max	5

Carrier Allocation

Specifies the carrier frequency allocation. There are two types of allocation, contiguous and non-contiguous. Non-Contiguous frequency allocation is defined as an allocation where two sub-blocks are separated with a sub-block gap:

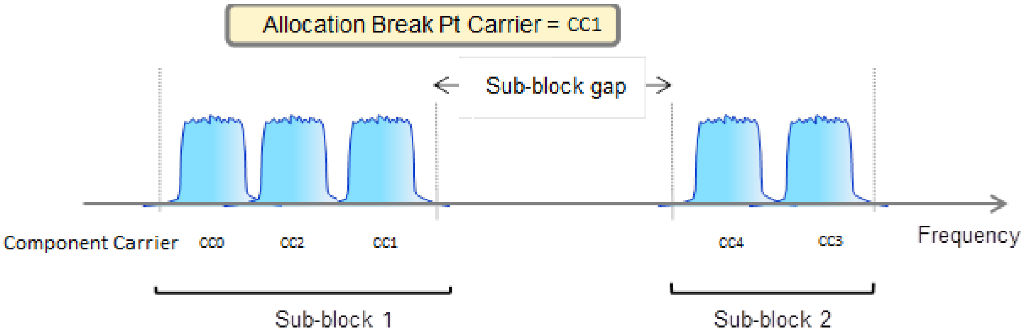
- CONTiguous – All the component carriers belong to one block and no sub-block gap exists
- NCONtiguous – Component carriers are separated into two sub-blocks. Allocation Break Pt Carrier determines how sub-blocks are configured

Remote Command	`[:SENSe]:CCARrier:CONFig:ALLocation CONTiguous | NCONtiguous` `[:SENSe]:CCARrier:CONFig:ALLocation?`
Example	`:CCAR:CONF:ALL CONT` `:CCAR:CONF:ALL?`
Preset	CONTiguous
State Saved	Saved in instrument state
Range	Contiguous|Non-Contiguous

Non-Contiguous Break at

Specifies an allocation break point in non-contiguous carrier allocation. First sub-block starts from the lowest frequency carrier and stops at the allocation break point carrier. Next sub-block starts from the next upper frequency carrier and ends at the highest frequency carrier.

one example is shown below. In the example carrier indices are not in the order of carrier frequency. In the example, Allocation Break Pt Carrier is CC1. It means that sub-block 1 ends at carrier CC1 and sub-block 2 starts at carrier CC4. Sub-block gap is located between carrier CC1 and CC4.



Remote Command	`[:SENSe]:CCARrier:CONFig:ALLocation:NCONtiguous:ABPoint CC0 | … | CC4` `[:SENSe]:CCARrier:CONFig:ALLocation:NCONtiguous:ABPoint?`
Example	`:CCAR:CONF:ALL:NCON:ABP CC0` `:CCAR:CONF:ALL:NCON:ABP?`
Notes	The options CC1~CC4 can be enabled with 9080B/9082B-2FP license
Dependencies	Allocation Break Point is coupled to Number of Component Carriers. For example, Allocation Break Point list will include CC0~CC1 if the number of Component Carriers is 2
Preset	CC0
State Saved	Saved in instrument state
Range	CC0|CC1|CC2|CC3|CC4

Configure Comp Carriers

Lets you perform a detailed configuration of your component carriers, including number of carriers, presets, bandwidth, offset, integration bandwidth, etc.

Configure CCs

Lets you configure System Bandwidth, frequency offsets, and integration bandwidth, and also lets you exclude certain carriers from the measurement.

Number of Component Carriers

See "Number of Component Carriers" on page 2245.

Carrier Allocation

See "Carrier Allocation" on page 2245.

Non-Contiguous Break at

See "Non-Contiguous Break at" on page 2246.

System BW

Enables you to set the system bandwidth of each component carrier for LTE-Advanced / NB-IoT signal (which also determines the total number of resource blocks for Modulation Analysis measurement).

Remote Command	`[:SENSe]:CCARrier0|…|4:RADio:STANdard:BANDwidth B1M4 | B3M | B5M | B10M | B15M | B20M | B200K` `[:SENSe]:CCARrier0|…|4:RADio:STANdard:BANDwidth?`
Example	`:CCAR4:RAD:STAN:BAND B5M`
Preset	B5M
State Saved	Yes
Range	1.4 MHz (6 RB) | 3 MHz (15 RB) | 5 MHz (25 RB) | 10 MHz (50 RB) | 15 MHz (75 RB) | 20 MHz (100 RB) | 200kHz (NB-IoT)
Backwards Compatibility SCPI	`[:SENSe]:RADio:STANdard:BANDwidth`

Measure Carrier

Sets whether to measure this component carrier or not.

Remote Command	`[:SENSe]:CCARrier0|…|4[:STATe] OFF | ON | 0 | 1` `[:SENSe]:CCARrier0|…|4[:STATe]?`
Example	`:CCAR0 ON` `:CCAR0?`
Notes	The command is used with a sub-op code <n> (default=0) to specify the component carrier for configuration. The range of the sub-op code is determined by the number of component carriers
Preset	ON
State Saved	Saved in instrument state
Range	On|Off

Frequency Offset

Sets the component carrier center frequency as offset from the Carrier Ref Frequency.

Remote Command	`[:SENSe]:CCARrier<n>:FREQuency:OFFSet <freq>` `[:SENSe]:CCARrier<n>:FREQuency:OFFSet?`
Example	`:CCAR4:FREQ:OFFS 10MHz` `:CCAR4:FREQ:OFFS?`
Notes	Used with a sub-op code <n> (default=0) to specify the component carrier for configuration. The range of the sub-op code is determined by the number of component carriers
Preset	0Hz
State Saved	Saved in instrument state
Min	-3.5GHz
Max	3.5GHz

Spectrum

Determines if the spectrum of the incoming data is mirrored or not. The actual mirroring is accomplished by conjugating the complex time data.

Note that only the Modulation Analysis measurement and Conformance EVM measurement support this feature.

Remote Command	`[:SENSe]:CCARrier0|…|4:SPECtrum NORMal	INVert` `[:SENSe]:CCARrier0|…|4:SPECtrum?`
Example	`:CCAR0:SPEC INV` `:CCAR0:SPEC?`
Preset	NORM
State Saved	Yes
Range	Normal | Invert
Backwards Compatibility SCPI	`[:SENSe]:SPECtrum`

UL/DL Configuration

Allows you to set the Uplink and Downlink allocation configuration of the signal being measured. The choice of link direction will determine which slot in the frame is used for uplink transmission, and which slot for downlink transmission.

Remote Command	`[:SENSe]:CCARrier0|…|4:RADio:STANdard:ULDL CONF0	…	CONF6` `[:SENSe]:CCARrier0|…|4:RADio:STANdard:ULDL?`
Example	`:CCAR0:RAD:STAN:ULDL CONF0`
Notes	CONF0: Configuration 0 (DSUUUDSUUU) CONF1: Configuration 1 (DSUUDDSUUD)

	CONF2: Configuration 2 (DSUDDDSUDD) CONF3: Configuration 3 (DSUUUDDDDD) CONF4: Configuration 4 (DSUUDDDDDD) CONF5: Configuration 5 (DSUDDDDDDD) CONF6: Configuration 6 (DSUUUDSUUD)
Preset	CONF0
State Saved	Yes
Range	Configuration 0|Configuration 1|Configuration 2|Configuration 3|Configuration 4|Configuration 5|Configuration 6
Backwards Compatibility SCPI	`[:SENSe]:RADio:STANdard:ULDL`

Dw/GP/Up Len

This control allows you to set the DwPTS/GP/UpPTS length configuration of the signal being measured. The choice of link direction will determine the length of DwPTS, GP and UpPTS in the Special Subframe.

Remote Command	`[:SENSe]:CCARrier0|…|4:RADio:STANdard:DGPU CONF0 | … | CONF9` `[:SENSe]:CCARrier0|…|4:RADio:STANdard:DGPU?`
Example	`:CCAR0:RAD:STAN:DGPU CONF0`
Notes	CONF0: Configuration 0 CONF1: Configuration 1 CONF2: Configuration 2 CONF3: Configuration 3 CONF4: Configuration 4 CONF5: Configuration 5 CONF6: Configuration 6 CONF7: Configuration 7 CONF8: Configuration 8 CONF9: Configuration 9
Dependencies	The special sub-frame configuration 9 is only enabled when it is LTE-Advanced TDD
Preset	CONF0
State Saved	Yes
Range	Configuration 0|Configuration 1|Configuration 2|Configuration 3|Configuration 4|Configuration 5|Configuration 6|Configuration 7|Configuration 8|Configuration 9
Backwards Compatibility SCPI	`[:SENSe]:RADio:STANdard:DGPU`

CHP Power Integ BW

Specifies the range of integration used in calculating the power in the component carrier s in the CHP measurement.

Remote Command	`[:SENSe]:CCARrier0|…|4:CHPower:BANDwidth:INTegration <freq>` `[:SENSe]:CCARrier0|…|4:CHPower:BANDwidth:INTegration?`
Example	`:CCAR0:CHP:BAND:INT 20MHz` `:CCAR0:CHP:BAND:INT?`
Notes	You must be in LTEATDD/LTEAFDD Mode to use this command. Use :INSTrument:SELect to set the mode
Couplings	When System Bandwidth of the parameter set is changed, the value of this parameter also changes as shown in the following table.

System Bandwidth	CHP Integ BW
1.4 MHz (B1M4)	1.4 MHz
3 MHz (B3M)	3 MHz
5 MHz (B5M)	5 MHz
10 MHz (B10M)	10 MHz
15 MHz (B15M)	15 MHz
20 MHz (B20M)	20 MHz
200 kHz(B200K)	200 kHz

Preset	5 MHz
State Saved	Saved in instrument state
Min	100 kHz
Max	20 MHz
Backwards Compatibility SCPI	`[:SENSe]:CHPower:BANDwidth:INTegration` `[:SENSe]:CHPower:BWIDth:INTegration`

ACP Power Integ BW

Specifies the Measurement Noise Bandwidth used to calculate the power in the component carriers in the ACP measurement.

Remote Command	`[:SENSe]:CCARrier0|…|4:ACPower:BANDwidth[1]|2:INTegration <freq>` `[:SENSe]:CCARrier0|…|4:ACPower:BANDwidth[1]|2:INTegration?`
Example	`:CCAR0:ACP:BAND:INT 20MHz` `:CCAR0:ACP:BAND:INT?`

Notes	Carrier sub op code, 1 is for BTS, 2 for MS. Default is BTS You must be in the LTEATDD/LTEAFDD mode. Use :INSTrument:SELect to set the mode
Couplings	When System Bandwidth of the parameter set is changed, the value of this parameter also changes as shown in the following table.

System Bandwidth	BTS ACP Meas Noise BW	MS ACP Meas Noise BW
1.4 MHz (B1M4)	1.095 MHz	1.08 MHz
3 MHz (B3M)	2.715 MHz	2.7 MHz
5 MHz (B5M)	4.515 MHz	4.5 MHz
10 MHz (B10M)	9.015 MHz	9.0 MHz
15 MHz (B15M)	13.515 MHz	13.5 MHz
20 MHz (B20M)	18.015 MHz	18.0 MHz
200 kHz(B200K)	180 kHz	180 kHz

Preset	4.515 MHz|4.5 MHz
State Saved	Yes
Min	100 kHz
Max	20 MHz
Backwards Compatibility SCPI	`[:SENSe]:ACPower:CARRier[1]|2:LIST:BANDwidth[:INTegration]` `[:SENSe]:ACPower:CARRier[1]|2:LIST:BWIDth[:INTegration]`

SEM Power Integ BW

Specifies the integration bandwidth used to calculate the power in the component carriers in SEM measurement.

Remote Command	`[:SENSe]:CCARrier0|…|4:SEMask:BANDwidth[1]|2:INTegration <freq>` `[:SENSe]:CCARrier0|…|4:SEMask:BANDwidth[1]|2:INTegration?`
Example	`:CCAR0:SEM:BAND:INT 20MHz` `:CCAR0:SEM:BAND:INT?`
Notes	Bandwidth sub op code, 1 is for BTS, 2 for MS. Default is BTS You must be in LTEATDD/LTEAFDD Mode to use this command. Use :INSTrument:SELect to set the mode
Couplings	When System Bandwidth of the parameter set is changed, the value of this parameter also changes as shown in the following table. Note that you cannot set the value exceeding the corresponding System Bandwidth

System Bandwidth	BTS SEM Integ BW	MS SEM Integ BW
1.4 MHz (B1M4)	1.095 MHz	1.08 MHz
3 MHz (B3M)	2.715 MHz	2.7 MHz
5 MHz (B5M)	4.515 MHz	4.5 MHz
10 MHz (B10M)	9.015 MHz	9.0 MHz
15 MHz (B15M)	13.515 MHz	13.5 MHz
20 MHz (B20M)	18.015 MHz	18.0 MHz
200 kHz(B200K)	180 kHz	180 kHz

Preset	4.515 MHz|4.5 MHz
State Saved	Saved in instrument state
Min	100 kHz
Max	20 MHz
Backwards Compatibility SCPI	`[:SENSe]:SEMask:BANDwidth[1]|2:INTegration`

Carrier Config Presets

Lets you configure the Component Carrier presets.

3.2.8.4 Meas Standard

Enables you to access Preset to Standard functions.

In LTE-Advanced TDD Mode, the parameters under Predefined Params impact the gate or trigger length and delay of the following measurements:

- Monitor Spectrum
- Channel Power
- ACP
- Power Stat CCDF
- Occupied BW
- Spectrum Emission Mask
- Spurious Emission

In LTE-Advanced FDD Mode, the Predefined Parameters in this section are used in the Transmit On/Off Power measurement. The Modulation Analysis measurement has its specific Predefined Parameters setting.

In LTE V2X Mode, Predefined parameters apply to all LTE V2X measurements.

System BW

Sets the demodulator to the specified bandwidth and configures the settings of every component carrier according to the default values listed in table for the current direction (Uplink or Downlink).

For example, when Number of Component is 3, after executing the command RAD:STAN:PRES B5M or selecting corresponding Bandwidth in the dropdown menu, all the 3 component carriers are configured as 5Mhz bandwidth, and all the settings of these 3 component carriers are set according to the table.

Remote Command	`[:SENSe]:RADio:STANdard:PRESet B1M4 | B3M | B5M | B10M | B15M | B20M | B200K`
Example	`:RAD:STAN:PRES B5M`
Notes	B200K selection is available in LTE-A FDD mode B200K option is for NB-IoT which requires N9080EM3E license
Couplings	Preset To Standard presets parameter values listed in section “Values for each Preset To Standard”. And the system bandwidth of each component carrier under the Component Carrier Setup will be preset to the selected one
Preset	B5M
State Saved	Yes
Range	1.4 MHz (6 RB) | 3 MHz (15 RB) | 5 MHz (25 RB) | 10 MHz (50 RB) | 15 MHz (75 RB) | 20 MHz (100 RB) | 200 kHz (NB-IoT)

UL/DL Config

Sets the TDD UL/DL Allocation parameter of each carrier to the selected value.

Remote Command	`[:SENSe]:RADio:STANdard:PRESet:ULDL CONF0 | … | CONF6` `[:SENSe]:RADio:STANdard:PRESet:ULDL?`
Example	`:RAD:STAN:PRES:ULDL CONF0`
Notes	CONF0: Configuration 0 (DSUUUDSUUU) CONF1: Configuration 1 (DSUUDDSUUD) CONF2: Configuration 2 (DSUDDDSUDD) CONF3: Configuration 3 (DSUUUDDDDD) CONF4: Configuration 4 (DSUUDDDDDD) CONF5: Configuration 5 (DSUDDDDDDD)

	CONF6: Configuration 6 (DSUUUDSUUD)
Dependencies	When the setting is selected, the ULDL Alloc per component carrier under the Component carrier Setup will be preset to the selected value
Preset	CONF0
State Saved	Yes
Range	Configuration 0|Configuration 1|Configuration 2|Configuration 3|Configuration 4|Configuration 5|Configuration 6

Dw/GP/Up Len

Sets the TDD special sub-frame configuration of each component carrier to the selected value.

Remote Command	`[:SENSe]:RADio:STANdard:PRESet:DGPU CONF0 | … | CONF9` `[:SENSe]:RADio:STANdard:PRESet:DGPU?`
Example	`:RAD:STAN:PRES:DGPU CONF0`
Notes	CONF0: Configuration 0 CONF1: Configuration 1 CONF2: Configuration 2 CONF3: Configuration 3 CONF4: Configuration 4 CONF5: Configuration 5 CONF6: Configuration 6 CONF7: Configuration 7 CONF8: Configuration 8 CONF9: Configuration 9
Dependencies	When the setting is selected, the Dw/GP/Up Len per Component Carrier under the Component Carrier Setup will be preset to the selected value The special sub-frame configuration 9 is only enabled when it is LTE-Advanced TDD
Preset	CONF0
State Saved	Yes
Range	Configuration 0|Configuration 1|Configuration 2|Configuration 3|Configuration 4|Configuration 5|Configuration 6|Configuration 7|Configuration 8|Configuration 9

Analysis Slot

Specifies the starting analysis slot. The measurement will adjust the gate delay or trigger delay according to this parameter.

Remote	`[:SENSe]:RADio:SLOT TS0 | TS1 | DPTS1 | UPTS1 | TS4 | TS5 | TS6 | TS7 | TS8 |`

Command	`TS9 | TS10 | TS11 | TS12 | TS13 | TS14 | TS15 | TS16 | TS17 | TS18 | TS19` `[:SENSe]:RADio:SLOT?`
Example	`:RAD:SLOT TS0`
Couplings	Measurement's gate length or meas interval will couple to the parameter
Preset	TS0
State Saved	Yes
Range	TS0 | TS1 | DwPTS1 | UpPTS1 | TS4 | TS5 | TS6 | TS7 | TS8 | TS9 | TS10 | TS11 | TS12(DwPTS2) | TS13 (UpPTS2) | TS14 | TS15 | TS16 | TS17 | TS18 | TS19

Meas Interval

This parameter specifies the desired slots count that needs to be analyzed. The measurement will adjust the gate length or meas interval according to this parameter.

For NB-IoT uplink cases scenarios, when Measure NPRACH is Off, this parameter indicates not only the slots' count to be analyzed, but the time elapse of the off power measurements as well.

In LTE-A FDD Mode, this parameter only appears in the Transmit On|Off Power measurement.

Remote Command	`[:SENSe]:RADio:MINTerval <integer>` `[:SENSe]:RADio:MINTerval`
Example	`:RAD:MINT 1`
Notes	The backwards compatible command [:SENSe]:PVTime:MINTerval is available in LTE FDD & LTE-A FDD Modes
Dependencies	This parameter is disabled when all the below conditions are met at the same time: – System BW is "200 kHz (NB-IoT)" – Direction is "uplink" – NB-IoT Subcarrier Spacing is "3.75kHz" – Meas NPRACH is "OFF"
Couplings	Disabled when the "Measure PRACH" is in scope and its value is not off, then the actual meas interval is the length PRACH or SRS channel For NB-IoT case scenario, when the parameter is disabled, its value is automatically determined by both Meas NPRACH:

Meas NPRACH	Meas Interval
Preamble0	3 slots
Preamble1	4 slots

Preset	1
State Saved	Yes
Min	1
Max	20, when System BW is NOT “200 kHz (NB-IoT) 16, otherwise
Backwards Compatibility SCPI	LTE: `[:SENSe]:PVTime:MINTerval`

CP Length

Specifies whether the cyclic prefix is configured as NORMal or EXTended for power measurement. The parameter will affect the gate length or meas interval parameters.

In LTE-A FDD Mode, this parameter only appears in the Transmit On|Off Power measurement.

Remote Command	`[:SENSe]:RADio:CPLength NORMal | EXTended` `[:SENSe]:RADio:CPLength?`
Example	`:RAD:CPL NORM`
Notes	The backwards compatible SCPI command [:SENSe]:PVTime:CPLength is available in LTE FDD & LTE-A FDD Modes
Dependencies	Disabled when System BW is set to “200 kHz (NB-IoT)” and Direction is “uplink”
Couplings	Set to NORMal when System BW is set to “200 kHz (NB-IoT)”
Preset	NORMal
State Saved	Yes
Range	Normal|Extended
Backwards Compatibility SCPI	LTE: `[:SENSe]:PVTime:CPLength`

Measure PRACH/SRS

Specifies whether the analysis slot is used for PRACH channel or SRS and the PRACH preamble format of the analysis slot.

The measurement will adjust the gate length or meas interval according to this parameter.

Remote Command	`[:SENSe]:RADio:MEASure OFF | PPF0 | PPF1 | PPF2 | PPF3 | PPF4 | SRS | DSRS` `[:SENSe]:RADio:MEASure?`

Example	`:RAD:MEAS OFF`
Couplings	If direction is downlink, the control is disabled and the value is set to off If this control value is not off, Meas Interval is disabled
Preset	OFF
State Saved	Yes
Range	Off|Preamble 0|Preamble 1|Preamble 2|Preamble 3|Preamble 4|SRS|DSRS

Reference Config

Specifies which component carrier's ULDL Allocation Configuration and Dw/Up Length Configuration settings are used to adjust time slot to be measured automatically. For Modulation Analysis measurement, this control specifies which CC is used as the reference CC for time alignment results.

In LTE-A FDD Mode, this parameter only appears in the Transmit On|Off Power and Modulation Analysis measurements.

Remote Command	`[:SENSe]:RADio:RCONfig CC0 | … | CC4` `[:SENSe]:RADio:RCONfig?`
Example	`:RAD:RCON CC0`
Notes	The options CC1~CC4 can be enabled with 9080B/9082B-2FP license
Dependencies	Reference Configuration is coupled to Number of Component Carriers. For example, reference configuration list will include CC0~CC1 if the number of Component Carriers is 2
Preset	CC0
State Saved	Yes
Range	CC0|CC1|CC2|CC3|CC4

3.2.8.5 Advanced

Contains controls for setting advanced functions of the instrument.

Does not appear in VXT.

Phase Noise Optimization

Lets you select the LO (local oscillator) phase noise behavior for various operating conditions. When in Auto, selects the LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions.

For full details, see "Parameter Options, Installed Options & Ranges" on page 301 below.

Remote Command	`[:SENSe]:CHPower:FREQuency:SYNThesis[:STATe] 1 | … | 5`
	For the meaning of each numeric option value, see "Parameter Options, Installed Options & Ranges" on page 301 below
	`[:SENSe]:CHPower:FREQuency:SYNThesis[:STATe]?`

Example	`:CHP:FREQ:SYNT 1` `:CHP:FREQ:SYNT?`
Dependencies	Does not appear in all models. For models in which the control is not displayed, the SCPI command is accepted for compatibility, although no action is taken
Preset	3
State Saved	Saved in instrument state
Range	See "Ranges" on page 306 below

Auto Function

Remote Command	`[:SENSe]:CHPower:FREQuency:SYNThesis:AUTO[:STATe] OFF | ON | 0 | 1` `[:SENSe]:CHPower:FREQuency:SYNThesis:AUTO[:STATe]?`
Example	`:CHP:FREQ:SYNT:AUTO 1` `:CHP:FREQ:SYNT:AUTO?`
Preset	`OFF`

Parameter Options, Installed Options & Ranges

The Phase Noise Optimization control lets you optimize the setup and behavior of the Local Oscillator (LO) depending on your specific measurement conditions. You may wish to trade off noise and speed, for example, to make a measurement faster without regard to noise or with optimum noise characteristics without regard to speed.

Parameter Values Summary

Option	#	Description
"Balanced" on page 302	1	– In instruments with EP0, balances close-in phase noise with spur avoidance – In instruments without EP0 optimizes phase noise for small frequency offsets from the carrier
"Best Wide-offset" on page 303	2	Optimizes phase noise for wide frequency offsets from the carrier
"Fast Tuning" on page 303	3	Optimizes LO for tuning speed
"Best Close-in" on page 302	4 or 1*	– In instruments with EP0, emphasizes close-in phase noise performance without regard to spur avoidance

Option	#	Description
		– In instruments without EP0, this setting is accepted but no action is taken
"Best Spurs" on page 303	5	– In instruments with EP0, emphasizes spur avoidance over close-in phase noise performance – In instruments without EP0, this setting is accepted but no action taken
Auto	-	Automatically selects LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions

*Dependent on Option EP0 installation. See "Best Close-in" on page 302 below.

The actual behavior varies somewhat depending on model number and option; for example, you always get Fast Tuning by choosing Option #3, but in some models, "Fast Tuning" on page 303 is identical in effect to "Best Close-in" on page 302.

Best Close-in

Without option EP0

`:FREQ:SYNT 1`

The LO phase noise is optimized for smaller offsets from the carrier, at the expense of phase noise farther out.

The actual frequency offset within which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset <20 kHz]

With option EP0

`:FREQ:SYNT 4`

In instruments with Option EP0, the LO is configured for the best possible close-in phase noise (offsets up to 600 kHz from the carrier), regardless of spurious products that occur with some center frequencies. Because this is generally less desirable for close-in measurements than the "Balanced" on page 302 setting, parameter 1 selects "Balanced" on page 302 in EP0 instruments, in the interests of optimizing code compatibility across the family. Parameter 4 selects "Best Close-in" on page 302, which is usually not as good a choice as "Balanced" on page 302.

Balanced

`:FREQ:SYNT 1`

In instruments with EP0, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ±1 octave around 400 kHz offset. The spurs will always be below –70 dBc.

Best Spurs

`:FREQ:SYNT 5`

In instruments with EP0, the LO is configured for better phase noise than the "Best Wide-offset" on page 303 case close to the carrier, but the configuration has 11 dB worse phase noise than the "Best Close-in" on page 302 case mostly within ±1 octave around 300 kHz offset. Spurs are even lower than in the "Balanced" on page 302 case at better than –90 dBc, whether or not the carrier is on-screen.

This setting is never selected when Phase Noise Optimization is in Auto, you must select it manually.

Best Wide-offset

`:FREQ:SYNT 2`

The LO phase noise is optimized for wider offsets from the carrier. Optimization is especially improved for offsets from 70 kHz to 300 kHz. Closer offsets are compromised and the throughput of measurements (especially remote measurements where the center frequency is changing rapidly), is reduced.

The actual frequency offset beyond which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset >30 kHz]

In instruments with Option EP0, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ±1 octave around 400 kHz offset. The spurs will always be below –70 dBc.

Fast Tuning

`:FREQ:SYNT 3`

In this mode, the LO behavior compromises phase noise at many offsets from the carrier in order to allow rapid measurement throughput when changing the center frequency or span. The term "Fast Tuning" on page 303 refers to the time it takes to move the local oscillator to the start frequency and begin a sweep; this setting does not impact the actual sweep time in any way.

In instruments with EP1, the LO behavior compromises phase noise at offsets below 4 MHz in order to improve measurement throughput. The throughput is especially affected when moving the LO more than 2.5 MHz and up to 10 MHz from the stop frequency to the next start frequency.

In instruments with Option EP0, this is the same configuration as "Best Spurs" on page 303. It is available with the "Fast Tuning" on page 303 label for convenience, and to make the user interface more consistent with other X-Series instrument family members.

(In models whose hardware does not provide for a "Fast Tuning" on page 303 option, the settings for "Best Close-in" on page 302 are used if "Fast Tuning" on page 303 is selected. This gives the fastest possible tuning for that hardware set.)

Auto

`:FREQ:SYNT:AUTO ON`

Selects the LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions. The selection rules are as follows.

Auto Optimization Rules

X-Series instruments have several grades of LO, offering different configurations when in the Auto Mode. The rules for Auto selection are as follows:

Models with Option	Conditions	Selection
EP0 Models with option EP0 have a two stage local oscillator, which switches to a single loop for fast tuning (available in UXA)	Center frequency is < 699.9 kHz	"Balanced" on page 302
	Span > 114.1 MHz, *or* RBW > 800 kHz	"Fast Tuning" on page 303
	RBW > 290 kHz, *or* Span > 4.2 MHz	"Best Wide-offset" on page 303
	Other conditions	"Balanced" on page 302
EP1 Models with option EP1 have a two-loop local oscillator, which switches to a single loop for fast tuning (available in PXA)	Span > 44.44 MHz, *or* RBW > 1.9 MHz, *or* Source Mode is set to “Tracking”	"Fast Tuning" on page 303
	Center frequency is < 195 kHz, *or* CF >= 1 MHz *and* Span <= 1.3 MHz *and* RBW <= 75 kHz	"Best Close-in" on page 302
	All other conditions	"Best Wide-offset" on page 303
EP2 Models with option EP2 use a different	CF < 130 kHz , *or* CF > 12 MHz *and* Span < 495 kHz *and* RBW < 40 kHz	"Best Close-in" on page 302

Models with Option	Conditions	Selection
loop bandwidth for the fast-tuning choice, which is a compromise between tuning speed and phase noise, giving good tuning speed at all offsets. Although not as good as for "Best Close-in" on page 302; this is useful when you have to look across a wide range of spans (available, for example, in MXA for excellent phase noise)	Span > 22 MHz, *or* RBW > 400 kHz, *or* CF ≤ 12 MHz *and* Span < 495 kHz *and* RBW < 23 kHz	"Fast Tuning" on page 303
	All other conditions	"Best Wide-offset" on page 303
EP4 (available in CXA for improved phase noise)	Span > 101 MHz *or* RBW > 1.15 MHz *or* Source Mode is set to “Tracking”	"Fast Tuning" on page 303
	CF is < 109 kHz *or* CF >= 4.95 MHz *and* Span <= 666 kHz *and* RBW < 28 kHz	"Best Close-in" on page 302
	All other conditions	"Best Wide-offset" on page 303
All Other Models Note that in these models, the hardware does not actually provide for an extra-fast tuning option, so the settings for "Fast Tuning" on page 303 are actually the same as "Best Close-in" on page 302, but the rules are implemented this way so that the user who doesn't care about phase noise but does care about tuning speed doesn't have to remember which of the other two settings gives faster tuning	Span > 12.34 MHz, *or* RBW > 250 kHz, *or* Source Mode is set to “Tracking”	"Fast Tuning" on page 303
	Center frequency is < 25 kHz, *or* CF >= 1 MHz *and* Span <= 141.4 kHz *and* RBW <= 5 kHz	"Best Close-in" on page 302
	All other conditions	"Best Wide-offset" on page 303

In all the above cases:

- The RBW to be used in the calculations is the equivalent –3 dB bandwidth of the current RBW filter
- The rules apply whether in swept spans, zero span, or FFT spans

Ranges

Option	Option #	Phase Noise Option	Range
No EPx Option	1	Best Close-in	[offset < 20 kHz]
	2	Best Wide-offset	[offset > 30 kHz]
	3	Fast Tuning	[same as Best Close-In]
EP0	4	Best Close-in	[offset < 600 kHz]
	1	Balanced	[offset < 600 kHz]
	5	Best Spurs	[offset < 600 kHz]
	2	Best Wide-offset	[offset > 800 kHz]
	3	Fast Tuning	[same as Best Close-In]
EP1	1	Best Close-in	[offset < 140 kHz]
	2	Best Wide-offset	[offset > 160 kHz]
	3	Fast Tuning	[single loop]
EP2, EP3, EP5	1	Best Close-in	[offset < 70 kHz]
	2	Best Wide-offset	[offset > 100 kHz]
	3	Fast Tuning	[medium loop bw]
EP4	1	Best Close-in	[offset < 90 kHz]
	2	Best Wide-offset	[offset > 130 kHz]
	3	Fast Tuning	[same as Best Close-In]

Noise Floor Extension

Lets you turn on/configure the **Noise Floor Extension** (NFE) function. Some Modes (such as Spectrum Analyzer Mode), support two states of NFE, Full and Adaptive. The `ON` state (in Modes which do not support Adaptive NFE) matches the `FULL` state (in Modes that *do* support Adaptive NFE).

In `ON` or `FULL` NFE, the expected noise power of the instrument (derived from a factory calibration) is subtracted from the trace data. This will usually reduce the apparent noise level by about 10 dB in low band, and 8 dB in high band (>~3.6 GHz).

In Adaptive NFE, there is not the same dramatic visual impact on the noise floor as there is in Full NFE. Adaptive NFE controls the amount of correction that is applied based on other instrument settings like RBW, averaging and sweep time. Adaptive NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement, such as settings that provide more averaging. The result is that when not much averaging is being performed, the signal displays more like the NFE-off case; and when lots of averaging is being performed, the signal displays more like the full-NFE case.

Adaptive NFE (in Modes which support it) is recommended for general-purpose use. For fully ATE (automatic test equipment) applications, where the distraction of a person using the instrument is not a risk, Full NFE is recommended.

NFE works with any RBW, VBW, detector, any setting of Average Type, any amount of trace averaging, and any signal type. It is ineffective when the trace is not smoothed (smoothing processes include narrow VBWs, trace averaging, and long sweep times with the detector set to Average or Peak). It works best with extreme amounts of smoothing, and with the average detector, with the Average Type set to Power.

In those cases where the cancellation is ineffective, it nonetheless has no undesirable side-effects. There is no significant speed impact to having **Noise Floor Extension** on.

The best accuracy is achieved when substantial smoothing occurs in each point before trace averaging. Thus, when using the average detector, results are better with long sweep times and fewer trace averages. When using the sample detector, the VBW filter should be set narrow with less trace averaging, instead of a wide VBW filter with more trace averaging.

NOTE

Noise Floor Extension has no effect unless the RF Input is selected, so it does nothing when **External Mixing** is selected.

In Modes that support Adaptive NFE, the default state of NFE is Adaptive (`ON`). In Modes that do not support Adaptive NFE, the default state of NFE is `OFF`. Prior to the introduction of Adaptive NFE (firmware version A.18.00), the default state of NFE was `OFF` for all Modes.

With the introduction of Adaptive NFE, the menu control is changed from **On|Off** to **Full|Adaptive|Off**. For SCPI Backwards Compatibility, the existing SCPI command to turn NFE on or off was retained, and a new command was added to set the state to turn Adaptive On or Off:

- `[:SENSe]:CORRection:NOISe:FLOor ON|OFF|1|0` is retained, default changed to On for modes that support Adaptive NFE
- `[:SENSe]:CORRection:NOISe:FLOor:ADAPtive ON|OFF|1|0` is added (for certain Modes), default = On
- `FULL` = `:CORRection:NOISe:FLOor ON` plus `:CORRection:NOISe:FLOor:ADAPtive ON`

See "More Information" on page 308

Remote Command	`[:SENSe]:CORRection:NOISe:FLOor ON | OFF | 1 | 0` `[:SENSe]:CORRection:NOISe:FLOor?`
Example	`:CORR:NOIS:FLO ON`
Dependencies	Only appears in instruments with the NFE or NF2 license installed. In all others, does not appear, but

	the SCPI command will be accepted without error but has no effect
Couplings	When NFE is enabled in any mode manually, a prompt will be displayed reminding you to perform the Characterize Noise Floor operation if it is needed. If NFE is enabled through SCPI and a Characterize Noise Floor operation is needed, an error will be entered in the system error queue
Preset	Unaffected by **Mode Preset**. Turned `ON` at startup and by **Restore Mode Defaults** in Modes that support Adaptive. Turned `OFF` at startup and by **Restore Mode Defaults** in Modes that do not support Adaptive
State Saved	No

Remote Command	`[:SENSe]:CORRection:NOISe:FLOor:ADAptive ON | OFF | 1 | 0` `[:SENSe]:CORRection:NOISe:FLOor:ADAptive?`

Example	Turn NFE `ON` (Full mode):
	`:CORR:NOIS:FLO ON`
	Set to Adaptive:
	`:CORR:NOIS:FLO:ADAP ON`

Dependencies	Only available in Modes that support Adaptive NFE Only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear, but the SCPI command is accepted without error (but has no effect)
Couplings	For backwards compatibility, sending `:CORR:NOIS:FLO ON` turns NFE Adaptive `OFF`. To turn Adaptive `ON`, you must issue the commands in the proper order, as shown in the example above
Preset	Not affected by **Mode Preset**, but set to `ON` at startup and by **Restore Mode Defaults**
State Saved	No

More Information

The instrument is characterized in the factory (or during a field calibration) with a model of the noise, referred to the input mixer, versus frequency in each band and path combination. Bands are 0 (low band) and 1 through 4 (high band) in a 26.5 GHz instrument, for example. Paths include normal paths, preamp paths, the electronic attenuator, etc.

In most band/path combinations, the noise can be well characterized based on just two parameters and the instrument frequency response before compensation for frequency-dependent losses.

After the noise density at the input mixer is estimated, the effects of the input attenuator, RBW, detector, etc. are computed to get the estimated input-port-referred noise level.

In the simplest case, the measured power (signal plus instrument noise) in each display point (bucket) is compensated by subtracting the estimated noise power, leaving just the signal power. This is the operation when the detector is Average, and the Average Type is set to Power.

In other cases, operation is often not quite as good but still highly effective. With peak detection, the noise floor is estimated based on the RBW and the duration of the bucket using the same equations used in the noise marker function. The voltage of the noise is subtracted from the voltage of the observed signal-plus-noise measurement to compute the estimated signal voltage. The peak detector is one example of processing that varies with detector to give good estimates of the signal level without the instrument noise.

For best operation, the average detector and the power scale are recommended, as already stated. Peak detection for pulsed-RF can still give excellent effectiveness. FFT analysis does not work well, and does not do NFE well, with pulsed-RF signals, so this combination is not recommended. Negative peak detection is not very useful, either. Sample detection works well, but is never better than the average detector because it doesn't smooth as well. The Normal detector is a combination of peak and negative peak behaviors, and works about as well as these.

For best operation, extreme smoothing is desirable, as already stated. Using narrow VBWs works well, but using very long bucket durations and the average detector works best. Reducing the number of trace points will make the buckets longer.

For best operation, the power scale (Average Type = Power) is optimum. When making CW measurements in the presence of noise without NFE, averaging on the decibel scale has the advantage of reducing the effect of noise. When using NFE, the NFE does an even better job than using the log scale ever could. Using NFE with the log scale is not synergistic, though; NFE with the power scale works a little better than NFE with log averaging type.

The results from NFE with internal preamp can often be lower than the theoretical noise in a signal source at room temperature, a noise density of -174 dBm/Hz. This is expected and useful behavior, because NFE is designed to report the amount of input signal that is in excess of the thermal noise, not the amount that includes the thermal noise. This can be a useful behavior because thermal noise often interferes with what you want to measure, instead of being part of what you want to measure. Note that NFE is not adequately accurate to always be able to read below kTB.

Adaptive NFE provides an alternative to fully-on and -off NFE. Fully-on NFE can, notably in cases with little or no averaging of the spectrum, result in a display that is distractingly unfamiliar in the variability in response to low level signals. Fully-off NFE fails to achieve the potential improvement in dynamic range and associated accuracy of measurement of low-level signals. Adaptive NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement—those settings with high degrees of variance reduction through some variant of averaging. When the potential improvement is small, the display acts like the NFE-off case, and when it is high, it acts like the fully-on case, and in-between, application is a compromise between attractiveness and effectiveness.

On instruments with the NF2 license installed, the calibrated Noise Floor used by Noise Floor Extensions should be refreshed periodically. Keysight recommends that the **Characterize Noise Floor** operation be performed after the first 500 hours of operation, *and* once every calendar year. The control to perform this is located in the **System, Alignments, Advanced** menu. If you have not done this yourself at the recommended interval, then when you turn on Noise Floor Extensions, the instrument will prompt you to do so with a dialog that says:

"This action will take several minutes to perform. Please disconnect all cables from the RF input and press Enter to proceed. Press ESC to cancel, or Postpone to postpone for a week"

If you **Cancel**, you will be prompted again the next time you turn NFE `ON`. If you **Postpone**, you will be prompted again after a week passes and you then turn NFE `ON`.

3.2.8.6 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, "Global Center Freq" on page 2276) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to `ON`, it applies to all Modes that support Global settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched `ON`, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Frequency** remains unchanged.

Adjusting the **Center Frequency** of any Mode that supports Global Settings, while **Global Center Freq** is `ON`, modifies the **Global Center Freq**.

When **Global Center Freq** is switched `OFF`, the **Center Frequency** of the current Mode is unchanged, but now the **Center Frequency** of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is `ON`, the **Global Center Freq** is preset to the preset **Center Frequency** of the current Mode.

This function resets to `OFF` when "Restore Defaults" on page 2278 is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:FREQuency:CENTer ALL | NONE` `:INSTrument:COUPle:FREQuency:CENTer?`
Example	`:INST:COUP:FREQ:CENT ALL` `:INST:COUP:FREQ:CENT?`
Preset	Set to `OFF` on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	`ALL|NONE`

Preset	`OFF`
Backwards Compatibility SCPI	`:GLOBal:FREQuency:CENTer[:STATe] 1 | 0 | ON | OFF` `:GLOBal:FREQuency:CENTer[:STATe]?`

Global EMC Std

When this control is switched `ON`, the current Mode’s EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the **Global EMC Std**, so you can switch between any of these Modes and the EMC Std remains unchanged.

Adjusting the EMC Std of any Mode that supports Global settings, while **Global EMC Std** is `ON` modifies the **Global EMC Std**.

When **Global EMC Std** is switched `OFF`, the EMC Std of the current Mode remains unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is `ON`, **Global EMC Std** is preset to the preset EMC Std of the current Mode.

This function resets to `OFF` when "Restore Defaults" on page 2278 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:EMC:STANdard ALL | NONE` `:INSTrument:COUPle:EMC:STANdard?`
Example	`:INST:COUP:EMC:STAN ALL` `:INST:COUP:EMC:STAN?`
Dependencies	Only available if Option EMC is installed
Preset	Set to `OFF` on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	`ALL | NONE`

Extend Low Band

The software maintains a Mode Global value called **Extend Low Band**.

Under the current sweep configuration crossing over two bands, when **Extend Low Band** is turned `ON`, the instrument checks whether one band can cover the whole sweep frequency range or not. If it can, then the instrument locks the band; otherwise, it does nothing (the band crossover occurs).

This function does *not* work when **Band Lock** under **System** > **Service** > **Lock Functions** is not -1 (no Band Lock). In that case, **Band Lock** takes priority over **Extend Low Band**.

This function resets to `OFF` when "Restore Defaults" on page 2278 is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:FREQuency:BAND:EXTend 0 | 1 | ON | OFF` `:INSTrument:COUPle:FREQuency:BAND:EXTend?`
Example	`:INST:COUP:FREQ:BAND:EXT 1` `:INST:COUP:FREQ:BAND:EXT?`
Preset	Set to `OFF` by **Global** Settings > **Restore Defaults** and **System** > **Restore Defaults** > **All Modes**
Range	`ON|OFF`

Restore Defaults

Resets all functions in the **Global** settings menu to `OFF`. Pressing **System**, **Restore Defaults**, **All Modes** has the same effect.

Remote Command	`:INSTrument:COUPle:DEFault`
Example	`:INST:COUP:DEF`
Backwards Compatibility SCPI	`:GLOBal:DEFault`

3.2.9 Sweep

Accesses controls to configure and control the acquisition of data, and the X-axis parameters of the instrument.

Depending on the selected mode and measurement, these controls might include: **Sweep Time**, **Continuous/Single**, **Pause/Resume**, **X Scale** and **Number of Points**.

3.2.9.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep Time

Controls the time the instrument takes to sweep the current frequency span in swept measurements, displays the sweep time in swept measurements, and displays the equivalent Sweep Time in FFT measurements.

When **Sweep Time** is in Auto, the instrument computes a time that will give accurate measurements based on other settings, such as RBW and VBW.

You can select a shorter sweep time to improve the measurement throughput (with some potential unspecified accuracy reduction), but the **Meas Uncal** indicator will appear if the sweep time you set is less than the calculated Auto Sweep time.

You can also select a longer sweep time, which can be useful (for example) for obtaining accurate insertion loss measurements on very narrowband filters.

NOTE Significantly faster sweep times are available with Option FS1.

NOTE The **Meas Uncal** (measurement uncalibrated) warning is displayed in the Status Bar at the bottom of the screen when the manual Sweep time entered is faster than the time computed by the instrument's Sweep time equations, that is, the Auto Sweep Time. The instrument's computed Sweep time will provide accurate measurements; if you sweep faster than this your measurements may be inaccurate. A **Meas Uncal** condition may be corrected by returning the Sweep Time to Auto; by entering a longer Sweep Time; or by choosing a wider RBW and/or VBW.

NOTE On non-sweeping hardware, this control is grayed-out. The value shown on this control is an estimate. It is the measurement's turnaround time, which is the sum of signal acquisition time, FFT time, and other overhead time, to complete the entire span of the measurement. If you need to specify the same "Sweep Time" as you would for sweeping hardware, send `[:SENSe]:<meas>:SWEep:TIME <time>`. The measurement emulates the "Sweep Time" effect, but this emulation is not straightforward, and therefore the behavior is not specified. Instead, we recommend using Minimum Acquisition Time, which provides better control.

Remote Command	`[:SENSe]:<meas>:SWEep:TIME <time>` `[:SENSe]:<meas>:SWEep:TIME?`

Example	Channel Power measurement:
	`:CHP:SWE:TIME 25ms`
	`:CHP:SWE:TIME?`

Notes	In the ACP measurement in WCDMA Mode, this parameter is preset by **Meas Method** selection. Preset

	values are as follows: – IBW: 29 ms – IBWR: 108 ms – FAST 7.5 ms
Dependencies	On non-sweeping hardware, this control is grayed out, and the Auto/Man toggle disappears. The read-only control shows estimated sweep time In those instruments, "Minimum Acquisition Time" on page 2127 is available
Couplings	Coupled to **Span**, **RBW**, **VBW**, and **Sweep Time Rules** when **Sweep Time** is set to Auto; **Sweep Time** changes when these parameters are changed When you manually set a value when in the **Auto** state, the state automatically changes to **Man**
Preset	Automatically Calculated unless noted below WCDMA Mode – Channel Power: 1.0 msOBW: 32.6 ms – ACP: 29 ms
State Saved	Saved in instrument state
Min	Other than non-sweeping hardware: Typically, 1 ms Non-sweeping hardware: N/A In the ACP measurement, when **Meas Method** is **Fast Power**, the minimum sweep time is span-dependent and automatically calculated
Max	Other than non-sweeping hardware: 4000 s Non-sweeping hardware: N/A
Annotation	The sweep time is displayed in the lower-right corner of the screen. The number of points is displayed parenthetically, as: Sweep 13.3 ms (1001 points) A "#" mark appears before "Sweep" in the annotation when it is switched from Auto to Manual coupling
Status Bits/OPC dependencies	Meas Uncal is Bit 0 in the register: `STATus:QUEStionable:INTegrity:UNCalibrated`

Auto Function

Remote Command	`[:SENSe]:<meas>:SWEep:TIME:AUTO OFF | ON | 0 | 1` `[:SENSe]:<meas>:SWEep:TIME:AUTO?`

Example	Channel Power measurement:
	`:CHP:SWE:TIME:AUTO OFF`
	`:CHP:SWE:TIME:AUTO?`

Preset	WCDMA Mode: `OFF` All others: `ON`

Minimum Acquisition Time

Available on non-sweeping hardware.

Specifies the minimum acquisition time for each “chunk” of the measurement result. The instrument automatically divides Span into multiple chunks if needed. Therefore, the total signal acquisition time for the entire Span is:

~(>~Minimum Acquisition Time) * (The number of chunks)

When in Auto, this parameter’s value is determined by other parameters, such as **Span**, **RBW** and **VBW**.

You can manually increase this parameter value from this Auto value.

If increased, the instrument acquires signal for the specified time duration for each chunk. It performs additional FFTs, and averages or peak-holds the FFT results for a chunk, depending on **Detector** settings.

Note that the actual acquisition time for each chunk may exceed the **Minimum Acquisition Time** value, in order to satisfy FFT time required by other parameters, and to perform an integer number of FFTs.

Remote Command	`[:SENSe]:<meas>:SWEep:ACQuisition:TIME <time>`
	`[:SENSe]:<meas>:SWEep:ACQuisition:TIME?`
	`<meas>` is the identifier for the current measurement; any one of `CHPower-|ACPower|OBWidth|MONitor`

Example	Channel Power measurement
	`:CHP:SWE:ACQ:TIME 500 ms`
	`:CHP:SWE:ACQ:TIME?`

Dependencies	Available only on non-sweeping hardware
Couplings	Coupled to **Span**, **RBW**, and **VBW** when in the Auto state When you manually set a value when in the **Auto** state, the state automatically changes to **Man**
Preset	Automatically calculated
State Saved	Saved in instrument state
Min	100 ns
Max	4.00 ks

Auto Function

Remote Command	`[:SENSe]:<meas>:SWEep:ACQuisition:TIME:AUTO OFF | ON | 0 | 1` `[:SENSe]:<meas>:SWEep:ACQuisition:TIME:AUTO?`

	`<meas>` is the identifier for the current measurement; any one of `CHPower-|ACPower|OBWidth|MONitor`
Example	Channel Power measurement: `:CHP:SWE:ACQ:TIME:AUTO OFF`
Preset	`ON`

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See "More Information" on page 316

Remote Command	`:INITiate:CONTinuous OFF	ON	0	1` `:INITiate:CONTinuous?`

Example	Put instrument into **Single** measurement operation:
	`:INIT:CONT 0`
	`:INIT:CONT OFF`
	Put instrument into **Continuous** measurement operation:
	`:INIT:CONT 1`
	`:INIT:CONT ON`

Preset	`ON` Note that `:SYST:PRES` sets `:INIT:CONT` to `ON`, but `*RST` sets `:INIT:CONT` to `OFF`
State Saved	Saved in instrument state
Annunciation	The **Single/Continuous** icon in the Meas Bar changes depending on the setting: – A line with an arrow is **Single** – A loop with an arrow is **Continuous**
Backwards Compatibility Notes	X-Series A-models had **Single** and **Cont** hardkeys in place of the **SweepSingleCont** softkey. In the X-Series A-models, if in single measurement, the **Cont** hardkey (and `INIT:CONT ON`) switched to continuous measurement, but never restarted a measurement and never reset a sweep X-Series B-models have a **Cont/Single** toggle control instead of **Single** and **Cont** hardkeys, but it is still true that, if in single measurement, the **Cont/Single** toggle control never restarts a measurement and never resets a sweep

More Information

Continuous Mode	The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the **Average/Hold Num**, the count stops incrementing, but the instrument

	keeps sweeping See the **Trace** key description under **Trace Average** for the averaging formula used both before and after the **Average/Hold Num** is reached. The trigger condition must be met prior to each sweep The type of trace processing for multiple sweeps is set under the **Trace** key, with choices of **Trace Average**, **Max Hold**, or **Min Hold**
Single Mode	The instrument takes a single sweep when in **Single** mode, or if in average or Max/Min Hold, or if there is a **Waterfall** window displayed, it takes multiple sweeps until the average/hold count reaches the **Average/Hold Num**, then the count stops incrementing, and the instrument stops sweeping See the **Trace** key description under **Trace Average** for the averaging formula used. The trigger condition must be met prior to the sweep The type of trace processing for multiple sweeps is set under the **Trace** key, with choices of **Trace Average**, **Max Hold**, or **Min Hold**

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

- `:INIT:CONT 1` has no effect
- `:INIT:CONT 0` places the instrument in Single Sweep but has no effect on the current sequence until k = N, at which point the current sequence will stop and the instrument will go to the idle state

See "Restart" on page 2279 for details of `:INIT:IMMediate`.

If the instrument is already in **Single** sweep, `:INIT:CONT OFF` has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending `:INIT:IMM` *does* reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending `:CALC:AVER:TCON UP`.

Restart

Restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending `:INIT:IMM`
- Sending `:INIT:REST`

See "More Information" on page 318

Remote Command	`:INITiate[:IMMediate]` `:INITiate:RESTart`
Example	`:INIT:IMM` `:INIT:REST`
Notes	`:INIT:REST` and `:INIT:IMM` perform exactly the same function
Couplings	Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The `STATus:OPERation` register bits 0 through 8 are cleared , *except* bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The `STATus:QUEStionable` register bit 9 (`INTegrity` sum) is cleared The `SWEEPING` bit is set The `MEASURING` bit is set
Backwards Compatibility Notes	For Spectrum Analysis Mode in ESA and PSA, the **Restart** hardkey and the `:INIT:REST` command restarted trace averages (displayed average count reset to 1) for a trace in **Clear Write**, but did not restart **Max Hold** and **Min Hold** In X-Series, the **Restart** hardkey and the `:INIT:REST` command restart not only **Trace Average**, but **MaxHold** and **MinHold** traces as well

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command `:CALC:AVER:TCON UP`.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

Event	Trace Effect
Clear/Write pressed (even if already in Clear/Write)	Set to mintracevalue
Max Hold pressed (even if already in Max Hold)	Set to mintracevalue

Event	Trace Effect
Min Hold pressed (even if already in Min Hold)	Set to maxtracevalue
Trace Average pressed (even if already in Trace Average)	Trace data unaffected but start new sweep/avg/hold
Restart pressed	Trace data unaffected but start new sweep/avg/hold
Parameter requiring restart changed (e.g., RBW)	Trace data unaffected but start new sweep/avg/hold

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k. This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N, as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K, shows the count for the sweep (data acquisition) in progress. K = k + 1, with a limit of N. The displayed value K changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** un-pauses the measurement. When paused, pressing **Restart** performs a Resume.

Remote Command	`:INITiate:PAUSe` `:INITiate:RESume`
Example	`:INIT:PAUS` `:INIT:RES`
Dependencies	Not displayed in Modes that do not support pausing
Annotation	Only on control

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORt` is sent, the alignment finishes *before* the abort function is performed, so `:ABORt` does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	`:ABORt`
Example	`:ABOR`
Notes	If :`INIT:CONT` is `ON`, then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met If :`INIT:CONT` is `OFF`, then `:INIT:IMM` is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met
Dependencies	For continuous measurement, `:ABORt` is equivalent to the **Restart** key Not all measurements support this command
Status Bits/OPC dependencies	The `STATus:OPERation` register bits 0 through 8 are cleared , *except* bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The `STATus:QUEStionable` register bit 9 (`INTegrity` sum) is cleared Since all the bits that feed into OPC are cleared by `:ABORt`, the Abort command will cause the `*OPC` query to return true

Sweep Time Annotation (Remote Query Only)

Returns the **Sweep Time Annotation** value. Available only on non-sweeping hardware.

This value is also displayed in the result trace window.

The value returned is the estimated turnaround time of each measurement cycle, in seconds. The turnaround time is the sum of the signal acquisition time, FFT time, and other overhead time, to complete the entire span of each measurement cycle.

Remote Command	`[:SENSe]:<meas>:SWEep:ETIMe?` `<meas>` is the identifier for the current measurement; any one of `CHPower-|ACPower|OBWidth|MONitor`
Example	Channel Power measurement

	`:CHP:SWE:ETIMe?`
Dependencies	Available only on non-sweeping hardware
Preset	Automatically calculated

3.2.9.2 Sweep Config

Accesses controls that enable you to configure the Sweep and Control functions of the instrument, such as Sweep Rules.

Sweep Time Rules

Switches the instrument between `NORMal` and `ACCuracy` sweep states.

Setting **Auto Sweep Time** to `ACCuracy` results in slower sweep times (usually about three times as long) but yields better amplitude accuracy for CW signals. The instrument amplitude accuracy specifications only apply when **Auto Sweep Time** is set to `ACCuracy`.

Additional amplitude errors that occur when **Auto Sweep Time** is set to `NORMal` are usually well under 0.1 dB, though this is not guaranteed. Because of the faster sweep times and still low errors, `NORMal` is the preferred setting of **Auto Sweep Time**. **Auto Sweep Time** is set to `NORMal` on a **Preset**. This means that in the Preset state, instrument amplitude accuracy specifications do not apply.

Remote Command	`[:SENSe]:CHPower:SWEep:TIME:AUTO:RULes NORMal | ACCuracy` `[:SENSe]:CHPower:SWEep:TIME:AUTO:RULes?`
Example	`:CHP:SWE:TIME:AUTO:RUL NORM` `:CHP:SWE:TIME:AUTO:RUL?`
Dependencies	Does not appear in Spectrum Analyzer Mode in VXT model M9421A
Preset	`NORMal`
State Saved	Saved in instrument state
Range	`NORMal|ACCuracy`

Points

Sets the number of points taken per sweep, and displayed in the traces. The current value of **Points** is displayed parenthetically, next to the sweep time in the lower-right corner of the display. Using more points provides greater resolution. Using fewer points compacts the data and decreases the time required to access a trace over the remote interface.

Increasing the number of points does not increase the sweep time. However, it can slightly impact the trace processing time and therefore the overall measurement speed. Decreasing the number of points does not decrease the sweep time, but it may speed up the measurement, depending on the other sweep settings (for example, in FFT sweeps). Fewer points will always speed up the I/O.

Due to minimum sweep rate limitations of the hardware, the minimum sweep time available to the user will increase above its normal value of 1 ms as the number of sweep points increases above 15001.

Changing the number of sweep points has several effects on the instrument.Since markers are read at the point location, the marker reading may change.The sweep time resolution will change. Trace data for all the traces will be cleared and, if "Sweep/Measure" on page 2282 is **Cont**, a new trace taken. If any trace is in average or hold, the averaging starts over.

Due to sweep time quantization issues, the knob and up/down keys cannot be used to adjust the number of points.

When in a split screen display each window may have its own value for points.

When sweep points is changed, an informational message is displayed, "Sweep points changed, all traces cleared."

Remote Command	`[:SENSe]:CHPower:SWEep:POINts <integer>` `[:SENSe]:CHPower:SWEep:POINts?`
Example	`:CHP:SWE:POIN 501` `:CHP:SWE:POIN?`
Dependencies	Not available when Signal ID is ON in External Mixing Neither the knob nor the step keys can be used to change this value. If it is tried, a warning is given Not displayed in Modes that do not support Swept
Couplings	Whenever the number of sweep points change: – All trace data is erased – Any traces with Update Off also switch to Display Off (equivalent to switching from View to Blank in older instruments) – Sweep time is re-quantized – Any limit lines that are on will be updated – If averaging/hold is on, averaging/hold starts over The resolution of setting the sweep time depends on the number of points selected
Preset	1001
State Saved	Saved in instrument state
Min	11
Max	20001
Annotation	On second line of annotations, in lower right corner in parenthesis behind the sweep annotation

IF Dithering

Lets you turn IF Dithering on or off. This is a technique used in unpreselected instruments (such as Keysight’s modular instruments) to enhance the rejection of images and internally-generated spurious signals.

Remote Command	`[:SENSe]:SWEep:IF:DITHer OFF | ON | 0 | 1` `[:SENSe]:SWEep:IF:DITHer?`
Dependencies	Only appears in Spectrum Analyzer Mode in VXT models
Preset	`OFF`
State Saved	Saved in instrument state

Image Protection

Lets you turn IF Protection on or off. This is a technique used in unpreselected instruments (such as Keysight’s modular instruments) to detect and suppress images and spurs that may be present in non-preselected hardware.

IF Protection takes two sweeps and by correlating the data between them, provides a single, correct power-versus-frequency trace.

Remote Command	`[:SENSe]:SWEep:IMAGeprot OFF | ON | 0 | 1` `[:SENSe]:SWEep:IMAGeprot?`
Dependencies	Only appears in Spectrum Analyzer Mode in VXT models
Preset	`ON`
State Saved	Saved in instrument state

3.2.10 Trace

Lets you control the acquisition, display, storage, detection and manipulation of trace data for the available traces. The Trace Control tab of this menu contains radio-button selections for the trace type (**Clear/Write, Trace Average, Max Hold, Min Hold**) and **View/Blank** setting for the selected trace.

3.2.10.1 Select Trace

Specifies the *selected trace*, which is the trace that will be affected when you change trace settings.

Select Trace appears above the menu panel, indicating that it applies to *all* controls in the menu panel. **Select Trace** is blanked if you select a tab whose controls do *not* depend on the selected trace (for example, **Trace Function**).

Notes	The selected trace is remembered even when not in the **Trace** menu
Dependencies	For the Swept SA measurement: – In Image Suppress mode, when you select a trace it becomes the active trace, and the formerly active trace goes into View – When you turn on Image Suppress, Update turns off for all traces except the selected trace For the ACP measurement, when **Meas Method** is `RBW`, `FAST` or `FPOWer`, **Select Trace** is disabled
Preset	Trace 1
State Saved	Yes

3.2.10.2 Trace Control

The controls on this tab allow you to set the "Trace Type" on page 2137 and its update mode.

There are four Trace Types:

- Clear/Write
- Trace Average
- Max Hold
- Min Hold

Each type handles data in a different way.

Each trace also has two values that determine whether it is being written or not, and whether it is being displayed or not. These values, **Update** and **Display,** are described fully in the "View/Blank" on page 2142 control description. Essentially, when **Update** is `ON`, a trace is updating, and when **Update** is `OFF` it is not. When **Display** is `ON`, it is visible and when **Display** is `OFF` it is not. These terms are used throughout the descriptions in this section.

Trace Type

There are four trace Types:

Option	Parameter	SCPI Example	Details
Clear/Write	`WRITe`	`:TRAC2:TYPE WRIT`	See: "Clear/Write" on page 328
Trace Average	`AVERage`	`:TRAC2:TYPE AVER`	See: "Trace Average" on page 329

Option	**Parameter**	**SCPI Example**	**Details**
Maximum Hold	`MAXHold`	`:TRAC3:TYPE MAXH`	See: "Max Hold" on page 330
Minimum Hold	`MINHold`	`:TRAC5:TYPE MINH`	See: "Min Hold" on page 330

Full descriptions of each type are provided below. You may select one of these types for each trace. Re-selecting the current **Trace Type** initiates the same action that selecting it the first time did, even though it is already selected. For example, selecting **Clear/Write** while **Clear/Write** is already selected will nonetheless clear the trace and begin rewriting it.

Besides the **Trace Type**, the "View/Blank" on page 2142 state must be set to **Active** (**Update**: `ON`, **Display**: `ON`) for a trace to be updating and visible. Selecting any **Trace Type** automatically makes the trace **Active**.

See also: "Trace Mode Backwards Compatibility Commands" on page 326

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe[1]|2|…|6:TYPE WRITe | AVERage | MAXHold | MINHold`
	`:TRACe[1]|2|…|6:TYPE?`
	For all other measurements:
	`:TRACe[1]|2|3:<meas>:TYPE WRITe | AVERage | MAXHold | MINHold`
	`:TRACe[1]|2|3:<meas>:TYPE?`
	where `<meas>` is the identifier for the current measurement

Example	`:TRAC:TYPE WRIT` `:TRAC:TYPE?`
Couplings	Selecting a **Trace Type** (by pressing any of the Trace Type selections or sending `:TRAC:TYPE`) sets the Trace to **Active** (**Update**: `ON`, **Display**: `OFF`), even if the same trace type was already selected When Detector setting is "Auto" (`[:SENSe]:<meas>:DETector:AUTO?`), Detector (`[:SENSe]:<meas>:DETector[:FUNCtion]?`) switches aligning with the switch of this parameter: "`NORMal`" with `WRITe` (Clear Write), "`AVERage`" with `AVERage`, "`POSitive` (peak)" with `MAXHold`, and "`NEGative` (peak)" with `MINHold`
Preset	Swept SA and Monitor Spectrum: `WRITe` All other measurements: `AVERage` Following **Preset**, all traces are cleared (all trace points set to mintracevalue)
State Saved	The type of each trace is saved in instrument state
Annunciation	The type for each trace is indicated in the Trace annunciator panel on the Measurement Bar

Trace Mode Backwards Compatibility Commands

In earlier instruments, the "Trace Modes" were: Clear/Write, Max Hold, Min Hold, View and Blank. Averaging was global to all traces and was controlled under the **BW/Avg** menu.

In X-Series, trace averaging can be done on a per-trace basis. The Trace Modes (now called Trace Types) are Clear/Write, Trace Average, Max Hold and Min Hold. View and Blank are set separately under "View/Blank" on page 2142.

While this provides more flexibility, it also gives rise to potential backwards compatibility problems. To mitigate these, the old Trace Mode command has been retained and a new Trace Type command has been added. The `:TRACe:MODE` command is retained for backwards compatibility, and the `:TRACe:TYPE`, `:TRACe:UPDate` and `:TRACe:DISPlay` commands introduced for ongoing use. The old Trace Modes are selected using `:TRAC:MODE`, whose parameters are mapped into calls to `:TRACe:TYPE`, `:TRACe:UPDate` and `:TRACe:DISPlay`, and the old global Averaging command `[:SENSe]:AVERage[:STATe]` is provided for backwards compatibility. See the individual command descriptions for details.

When **Average/Hold** in the **Meas Setup**, **Legacy Compatibility** menu is `ON`, the following is true for traces in Max Hold and Min Hold:

- They ignore the **Average/Hold** number; **Single** for Max Hold causes one sweep only, so switching to **Single** stops after the current sweep, and switching to **Cont** starts again without clearing the accumulated result
- Max Hold is not cleared on a **Restart**, **Single** or `:INIT:IMM`, but changing a measurement parameter, like frequency or bandwidth etc., still restarts the Max Hold

Preset	`WRITe`
State Saved	The trace mode is an alias only
Backwards Compatibility SCPI	`:TRACe[1]|2|…|6:MODE WRITe | MAXHold | MINHold | VIEW | BLANk` `:TRACe[1]|2|…|6:MODE?`
Backwards Compatibility Notes	The legacy `:TRACe:MODE` command is retained for backwards compatibility. In conjunction with the legacy `:AVERage` command, it works as follows: – `:AVERage ON|OFF` sets/clears a variable that we will call average for the sake of this discussion. This variable is maintained by the instrument solely for backwards compatibility. See the `[:SENSe]:AVERage[:STATe]` command description below – `:TRACe:MODE WRITe` sets `:TRACe:TYPE WRITe` (Clear/Write) unless average is true, in which case it sets it to `:TRACe:TYPE AVErage`. It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace – `:TRACe:MODE MAXHold` sets `:TRACe:TYPE MAXHold` (Max Hold). It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace – `:TRACe:MODE MINHold` sets `:TRACe:TYPE MINHold` (Min Hold). It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace – `:TRACe:MODE VIEW` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay ON`, for the selected trace

	– `:TRACe:MODE BLANk` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay OFF`, for the selected trace The query returns the same value as `:TRACe:TYPE?`, meaning that if you set `:TRACe:MODE:VIEW` or `:TRACe:MODE:BLANk`, the query response will not be what you sent `:TRACe[n]:MODE` was formerly used to set the type or "writing mode" of the trace. At that time, View and Blank were writing modes. The new `:TRACe:TYPE` command should be used in the future, but `:TRACe:MODE` is retained to provide backwards compatibility In X-Series, unlike earlier instruments, Max Hold and Min Hold now obey the Average Number and counts up to a terminal value as Average always has As the **Average/Hold Number** now affects **Min Hold** and **Max Hold**, the operations that restart Averaging (for example, the **Restart** key) now also restart **Min Hold** and **Max Hold** As a result of these changes, legacy code that restarts averaging while retaining a running Max Hold will need to be rewritten, because the Max Hold will now restart when the Average does Also, previous to X-Series: – Pressing **Max Hold** while already in **Max Hold** (or doing so remotely) had no effect. Now it will clear the trace and restart the sweep and the Max Hold sequence – Changing the vertical scale (Log/Lin or dB/div) of the display restarted **Max Hold** and **Min Hold**. This is no longer the case
Preset	`OFF`
State Saved	The state of Average is saved in Instrument State for ghosting purposes
Backwards Compatibility SCPI	`[:SENSe]:AVERage[:STATe] ON | OFF | 1 | 0` `[:SENSe]:AVERage[:STATe]?`
Backwards Compatibility Notes	Previous to X-Series, Averaging (also sometimes known as trace averaging) was global to all traces, that is, it was either on or off for all active traces. The legacy command `[:SENSe]:AVERage [:STATe] ON|OFF|1|0` was used to turn Averaging on or off In X-Series, Averaging is turned on or off on a per-trace basis, so it can be on for one trace and off for another For backwards compatibility, the old global Average State variable is retained solely as a legacy variable, turned on and off and queried by the legacy command `[:SENSe]:AVERage[:STATe] OFF|ON|0|1.` When Average is turned on, any trace in Clear/Write will get put into Average. While Average is on, any trace put into Clear/Write by the old `:TRAC:MODE` command will instead get put into Average. When Average is turned off, any trace in Average will get put into Clear/Write

Trace Type Details

Clear/Write

Each trace update replaces the old data in the trace with new data.

Pressing **Clear/Write** for the selected trace, or sending `:TRAC:TYPE WRIT` for the specified trace, sets the trace type to **Clear/Write** and clears the trace, even if you are already in **Clear/Write**. Then a new sweep is initiated. Trigger conditions must be met before the sweep actually starts, and if in **Single** the sweep won't start until **Restart** is pressed.

Pressing **Clear/Write** stops the current sweep and initiates a new one, so **Trace Average, Max Hold** and **Min Hold** data may be interrupted in mid-sweep when **Clear/Write** is pressed, and therefore may not accurately reflect the displayed count. Therefore, when **Clear/Write** is pressed for one trace, **Trace Average, Max Hold** and **Min Hold** must restart for all traces.

When in **Clear/Write**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), a new sweep is initiated but the trace is not cleared.

Trace Average

The instrument maintains and displays an average trace, which represents the cumulative average on a point-by-point basis of the new trace data and previous averaged trace data.

Pressing **Trace Average** (for the selected trace), or sending `:TRAC:TYPE AVER` (for the specified trace), sets the trace type to **Trace Average**, clears the trace, initiates a new sweep, and restarts the Average sequence.

Details of the count limiting behavior and the averaging calculations may be found under **Avg|Hold Number** and **Average Type** under **Meas Setup.**

When in **Trace Average**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like Center Frequency or Attenuation), the average restarts and a new sweep is initiated but the trace is not cleared.

Restarting the average means:

- The average/hold count k is set to 1, so that the next time the average trace is displayed it simply represents one trace of new data
- A new sweep is initiated
- Once the new sweep starts, the trace is overwritten with current trace data as the first trace of the new average

Remember that restarting averaging also restarts **Max Hold** and **Min Hold**, as there is only one count for Trace Average and Hold.

Max Hold

The instrument maintains and displays a max hold trace, which represents the maximum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under **Meas Setup.**

Pressing **Max Hold** for the selected trace, or sending `:TRAC:TYPE MAXH` for the specified trace, sets the Trace Type to **Max Hold,** clears the trace , initiates a new sweep, and restarts the hold sequence, even if you are already in **Max Hold**.

When in **Max Hold**, if a measurement-related instrument setting is changed(that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Max Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Max Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the max hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated.

Remember that restarting **Max Hold** also restarts averaging and **Min Hold**, as there is only one count for Trace Average and Hold.

Min Hold

The instrument maintains and displays a min hold trace, which represents the minimum data value on a point-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under the **Meas Setup** functions.

Pressing **Min Hold** for the selected trace, or sending `:TRAC:TYPE MINH` for the specified trace, sets the Trace Type to **Min Hold,** clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Min Hold**.

When in **Min Hold**, if a measurement-related instrument setting is changed(that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Min Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Min Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the min hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated

Remember that restarting **Min Hold** also restarts **Max Hold** and averaging, because there is only one count for Trace Average and Hold.

Clear and Write | Restart Averaging | Restart Max/Min Hold

Starts the trace writing, as though the "Trace Type" on page 2137 had just been selected. The effect is exactly the same as reselecting the current **Trace Type** again – the control is provided because it may not be obvious that reselecting the same selection from a radio button menu will take any action.

This control displays different labels, depending on the selected Trace Type:

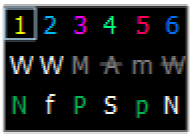
- **Clear/Write**: Clear and Write
- **Trace Average**: Restart Averaging
- **Max Hold**: Restart Max Hold
- **Min Hold**: Restart Min Hold

View/Blank

Lets you set the state of the two trace variables: **Update** and **Display**. The choices available in this dropdown menu are:

Active	Update and Display both ON
View	Update OFF; Display ON
Blank	Update OFF; Display OFF
Background	Update ON, Display OFF Allows a trace to be blanked *and* continue to update “in the background”, which was not possible in the past

In the Swept SA measurement, a trace with **Display**OFF is indicated by a strikethrough of the type letter in the trace annotation panel in the Measurement Bar. A trace with **Update**OFF is indicated by dimming the type letter in the trace annotation panel in the Measurement Bar. In the example below, Traces 3, 4, 5 and 6 have **Update**OFF, and Traces 4 and 6 have **Display**OFF.



See: "More Information" on page 333

Notes	For the commands to control the two variables, Update and Display, see "Trace Update State On/Off" on page 332 and "Trace Display State On/Off" on page 332 below
Dependencies	When Signal ID is on, this key is grayed-out

Couplings	Selecting a Trace Type for a trace (pressing the key or sending the equivalent command) puts the trace in **Active** (Update `ON` and Display `ON`), even if that trace type was already selected Selecting a detector for a trace (pressing the key or sending `[:SENS]:DET:TRAC`) puts the trace in **Active** (**Update**`ON` and **Display**`ON`), even if that detector was already selected Selecting a "Math Function" on page 1145 other than `OFF` for a trace (pressing the key or sending the equivalent command) puts the trace in **Active** (**Update**`ON` and **Display**`ON`), even if that Math Mode was already selected Loading a trace from a file puts that trace in **View** regardless of the state it was in when it was saved; as does being the target of a **Copy** or a participant in an **Exchange**

Trace Update State On/Off

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe[1]|2|…|6:UPDate[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|…|6:UPDate[:STATe]?`
	For all other measurements:
	`:TRACe[1]|2|3:<meas>:UPDate[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|3:<meas>:UPDate[:STATe]?`
	where <meas> is the identifier for the current measurement

Example	Make trace 2 inactive (stop updating): `:TRAC2:UPD 0`
Couplings	Whenever you set **Update** to `ON` for any trace**,** the **Display** is set to `ON` for that trace

Preset	For Swept SA Measurement (in SA Mode):
	`1|0|0|0|0|0`
	`ON` for Trace 1; `OFF` for 2–6
	For all other measurements:
	`1|0|0`
	`ON` for Trace 1; `OFF` for 2 &3

State Saved	Saved in instrument state

Trace Display State On/Off

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe[1]|2|…|6:DISPlay[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|…|6:DISPlay[:STATe]?`
	For all other measurements:
	`:TRACe[1]|2|3:<meas>:DISPlay[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|3:<meas>:DISPlay[:STATe]?`
	where <meas> is the identifier for the current measurement

Example	Make trace 1 visible:
	`:TRAC2:DISP 1`
	Blank trace 3:
	`:TRAC3:DISP 3`

Couplings	Whenever you set **Update** to `ON` for any trace, the **Display** is set to `ON` for that trace

Preset	For Swept SA Measurement (in SA Mode):
	`1|0|0|0|0|0`
	`ON` for Trace 1; `OFF` for 2–6
	For all other measurements:
	`1|0|0`
	`ON` for Trace 1; `OFF` for 2 &3

State Saved	Saved in instrument state

More Information

When a trace becomes inactive, any update from the `:SENSe` system (detectors) immediately stops, without waiting for the end of the sweep. The trace data remains unchanged, but stops updating. If the trace is blanked, this still does not affect the data in the trace. Traces that are blanked (**Display**=`OFF`) do not display nor appear on printouts, but their data stays intact, they may be queried, and markers may be placed on them

In most cases, inactive traces are static and unchanging; however, there are cases when an inactive trace will update, specifically:

- if data is written to that trace from remote
- if trace data is loaded from mass storage
- if the trace is the target of a **Copy** or participant in an **Exchange**
- if the trace is cleared using **Clear Trace**

Inactive traces that are also being displayed (traces in **View**) are displayed at half intensity. Traces in **View** display across the entire X-Axis of the instrument. Their horizontal placement does not change, even if X-Axis settings subsequently are changed, although Y-Axis settings do affect the vertical placement of data.

When a trace becomes active (**Update**=`ON`), the trace is cleared, the average count is reset, and a new sweep is initiated.

Note that putting a trace into **Display**=`OFF` and/or **Update**=`OFF` does *not* restart the sweep and does *not* restart Averaging or Hold functions for any traces.

3.2.10.3 Math

Lets you turn on and configure Trace Math functions.

Math Function

Trace Math functions perform mathematical operations between traces and, in some cases, user-specified offsets. When in a Trace Math function, the indicated function is performed during the sweep with the math function used in place of a detector. The trace operands for the math function are set using the "Operand 1 / Operand 2" on page 1151 controls.

- See "How trace math is processed" on page 338

Remote Command

For option details, see "Trace Math Options" on page 336

For Swept SA Measurement (in SA Mode):

```
:CALCulate:MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference |
OFF, <trace_num>, <trace_num>, <real>,<real>
```

```
:CALCulate:MATH? <trace_num>
```

where `<trace_num>` is any one of:

`TRACE1|…|TRACE6`

For all other measurements:

```
:CALCulate:<meas>:MATH <trace_num>, PDIFference | PSUM | LOFFset |
LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>
```

```
:CALCulate[:<meas>]:MATH? <trace_num>
```

where:

`<meas>` is the identifier for the current measurement, and

`<trace_num>` is any one of:

`TRACe1|TRACe2|TRACe3`

Note that the format of the `TRACe<n>` parameter differs from that for the Swept SA Measurement

Example

```
:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0
```

Sets Trace 3 to Power Diff trace math function, and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2

```
:CALC:MATH TRACE3,PSUM,TRACE1,TRACE2,0,0
```

Sets Trace 3 to Power Sum trace math function and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2

```
:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0
```

Sets Trace 3 to Log Offset trace math function, sets the First Trace operand (for Trace 3) to Trace 1, leaves the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and sets the Log Offset (for Trace 3) to -6 dB

```
:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00
```

	Sets Trace 3 to Log Diff trace math function, sets the First Trace operand (for Trace 3) to Trace 1, sets the Second Trace operand (for Trace 3) to Trace 2, and sets the Log Difference reference (for Trace 3) to -6 dBm `:CALC:MATH TRACE1,OFF,TRACE2,TRACE3,0,0` Turns off trace math for trace 1

Notes	The Trace Math Function command has 6 main set of parameters:
	- Set 1 defines the “result trace”:
	`TRACE1|…|TRACE6`
	-Set 2 defines the “function”:
	`PDIFference|PSUM|LOFFset|LDIFference|OFF`
	- Set 3 is a “trace operand” (1):
	`TRACE1|…|TRACE6`
	- Set 4 is a “trace operand” (2):
	`TRACE1|…|TRACE6`
	- Set 5 defines the “Log Offset” (in dB)
	- Set 6 defines the “Log Difference Reference” (in dBm)
	Note that the trace math mode is an enumeration; that is, when a math function is set for a trace, it turns off any math function that is on for that trace, then sets the new math function
	The parameters sent in the command are reflected in the values in the control menu. There is no default for any parameter; all 6 parameters must be sent to satisfy the parser. Failure to specify a parameter will result in a missing parameter message
	The query returns the math mode, the operand traces, the offset and the reference for the specified trace, all separated by commas

Dependencies	Trace Math is not available if **Normalize** is on Trace Math is not available if Signal ID is on None of the trace operands can be the destination trace. If any of the three trace math commands is sent with a destination trace number matching one of the operands, a warning is generated and the function does not turn on
Couplings	When a math function is changed for a trace, that trace is set to Display = `ON`; and Update = `ON`

Preset	For Swept SA Measurement (in SA Mode):
	`OFF,TRACE5,TRACE6,0,0 | OFF,TRACE6,TRACE1,0,0 | OFF,TRACE1,TRACE2,0,0 | OFF,TRACE2,TRACE3,0,0 | OFF,TRACE3,TRACE4,0,0 | OFF,TRACE4,TRACE5,0,0`
	For all other measurements:
	`OFF,TRACE2,TRACE3,0,0 | OFF,TRACE3,TRACE1,0,0 | OFF,TRACE1,TRACE2,0,0`

State Saved	The trace math function for each trace is saved in instrument state
Annunciation	An “f” is shown on the trace annunciation panel in the Measurement Bar when a math function is on; and the function is annotated on the trace if Trace Annotation is on
Status Bits/OPC dependencies	`*OPC` can be used to detect the completion of a sweep, which will also correspond to the completion of the math operation, since all math takes place during the sweep

Trace Math Options

IMPORTANT To generate a trace math result, *you must take a sweep*. The trace math engine, described below, operates in concert with the sweep engine in the instrument. Until a sweep has been taken, even if the constituent traces are not in Update mode, no result is generated.

Note that certain events can affect the trace in ways that affects all points at once. This can happen in any number of ways, including:

- A trace clear taking place
- A trace being loaded from the file system
- Trace data being sent in from the remote interface
- A copy or exchange of trace data

You should try to avoid these occurrences during a sweep, as they will tend to invalidate the math result being accumulated.

The Trace Math functions are:

Power Diff (Op1 - Op2)

Calculates a power difference between the `First Trace` operand and the `Second Trace` operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace:

`DestinationTrace = 10 log(10(1/10)(FirstTrace) – 10(1/10)(SecondTrace))`

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in `FirstTrace` is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

Otherwise, if the result of the subtraction is less than or equal to 0, the resultant point is `mintracevalue`.

Power Sum (Op1 + Op2)

Calculates a power sum between the `First Trace` operand and the `Second Trace` operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

`DestinationTrace = 10 log(10(1/10)(FirstTrace) + 10(1/10)(SecondTrace))`

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in either trace operand is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

Log Offset (Op1 + Offset)

Calculates a log offset from the `First Trace` operand and puts the result in the destination trace. This is like the B-DL function in some older instruments. The offset is entered on the `Offset` control, which only appears when this math function is in force for the selected trace. Each destination trace has its own offset.

During the sweep, the following formula is executed for each point in the trace operand, and the corresponding point is generated for the destination trace.

`DestinationTrace = FirstTrace + Offset`

The values of the trace points are assumed to be in dBm (as they are internally stored) and the offset is in dB.

If a point in the trace operand is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

If a point in the trace operand is equal to `mintracevalue`, the resultant point is also `mintracevalue`.

Example: If offset is 25 dB, then our destination trace will be higher than the operand trace by 25 dB.

Note that the `Second Trace` operand is not used for this function.

Log Diff (Op1 - Op2 + Ref)

Offsets the difference between the `First Trace` operand and the `Second Trace` operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

Offsets the difference between the `First Trace` operand and the `Second Trace` operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

`DestinationTrace = (FirstTrace - SecondTrace) + Reference`

The values of the operand trace points are assumed to be in decibel units (as they are internally stored) and the reference is in dBm so the result is in dBm.

Example: If the first operand trace 1 is at 5 dBm, the second operand trace 2 is at –5 dBm, and the reference is –25 dBm, then the destination trace will be –15 dBm.

Example: If the first operand trace1 is at 60 dBuV, the second operand trace 2 is at 50 dBuV, and the reference is 35 dBuV, then the destination trace will be 45 dBuV.

If a point in `FirstTrace` is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

If a point in `FirstTrace` is equal to `mintracevalue`, the resultant point is also `mintracevalue`.

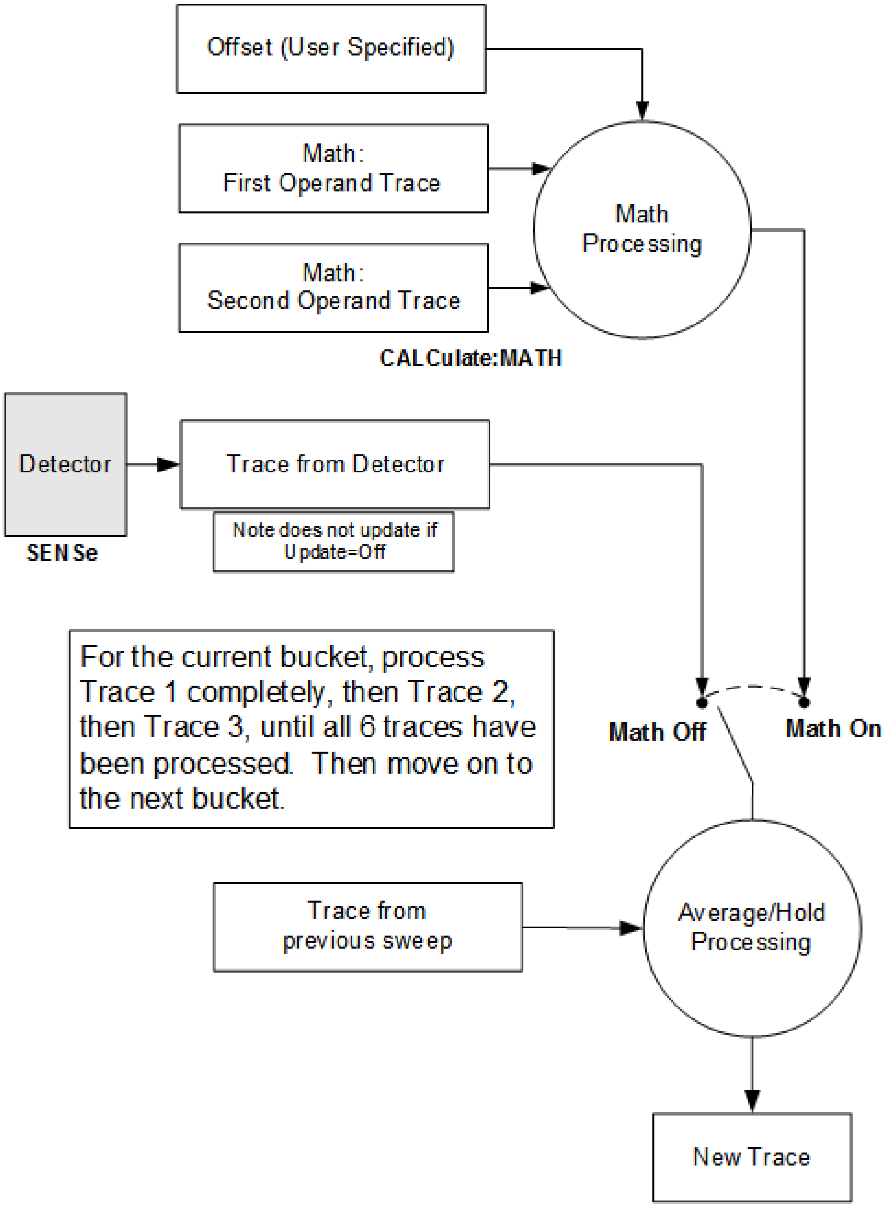
If neither of the above is true for a given point, then:

- If that point in `SecondTrace` is equal to `maxtracevalue`, the resultant point is `mintracevalue`.
- If that point in `SecondTrace` is equal to `mintracevalue`, the resultant point is `maxtracevalue`.

How trace math is processed

Whenever a trace math function is turned on, or the parameters and/or operands of an existing trace math function are changed, the destination trace is cleared. After the trace is cleared, all x-axis values in the trace, and the domain of the trace, are set to match the X-Axis settings of the first trace operand. When this is complete, a new sweep is initiated.

The process of acquiring data, processing it using the math and Average/Hold functions, and presenting it as trace data, consists of several functional blocks, as shown below:



For the current bucket, process Trace 1 completely, then Trace 2, then Trace 3, until all 6 traces have been processed. Then move on to the next bucket.

NOTE ABOUT OFFSETS: When either External Gain or Ref Level Offset is on, an offset is applied to the trace operands, and when Trace Math is on this offset is applied before any math processing is performed. Since the operands have already been offset the result trace should NOT be offset. Therefore when any Trace Math operation is performed, the sum of (External Gain - Ref Level Offset) is added to the result before it is stored in the result trace.

For each active trace, the current trace point is processed for `Trace 1`, then `Trace 2`, then `Trace 3`, etc. Trace data is taken from either the detector for that trace, or

from the mathematical result of up to two other traces and an offset, depending on whether trace math is on or not. The resultant data is then fed to the Average/Hold processing block, where (if the trace type is **Average**, **Max Hold**, or **Min Hold**) it is processed with previous trace data. The new trace data resulting from this process is then available for display, storage or remote output.

When the processing is complete for `Trace 1`, `Trace 2` is processed, and so on until all six traces have been processed. This allows a downstream trace to use as one of its math components a fully processed upstream trace. In other words, if math is `ON` for `Trace 4`, and its operand traces are `Trace 2` and `Trace 3`, then all detector, math, average and hold processing for Traces 2 and 3 is completed before the math is performed for `Trace 4`. When the current trace point is completed for all traces, the instrument moves on to the next trace point.

This allows very flexible and powerful math functions to be configured. For example, `Trace 1` can be an average trace, which can be fed with an offset to `Trace 2`, which can also be in **Max Hold**, allowing you to obtain the **Max Hold** of an Average trace.

Note that none of this processing is performed on inactive traces.

Note also that for any active trace with math `ON`, the Operand traces should have *lower* numbers than the trace (for example, using `Trace 4` as an operand for `Trace 1` will cause the data coming from `Trace 4` to be delayed by one sweep).

Operand 1 / Operand 2

These two controls select the first and second trace operands to be used for the trace math functions for the destination trace. The operands are common to all math functions for a given trace. The most recently sent `:CALCulate:MATH` command for a given trace sets the operands for that trace. Those settings are displayed on the trace operand controls for that trace.

Example	The following examples are for the Swept SA measurement
	Set Trace 3 to Power Diff trace math function. Set the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2:
	`:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0`
	Set Trace 3 to Log Offset trace math function. Set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB:
	`:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`

Notes	See "Math Function" on page 1145 for how to specify Operands 1 and 2 using `:CALCulate:MATH`
Dependencies	The destination trace cannot be an operand. The destination trace number is grayed-out on the dropdown
Preset	Operand 1: Trace number minus 2 (wraps at 1). For example, for Trace 1, Operand 1 presets to Trace

	5; for Trace 6, it presets to Trace 4 Operand 2: Trace number minus 1 (wraps at 1). For example, for Trace 1, Operand 2 presets to Trace 6; for Trace 6, it presets to Trace 5
State Saved	Operands 1 and 2 for each trace are stored in instrument state

Offset

Used by the Log Offset math function.

Example	The following example is for the Swept SA measurement Set Trace 3 to Log Offset trace math function, set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB: `:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`
State Saved	The Log Offset value for each trace is saved in Instrument State
Min	–100 dB
Max	100 dB

Reference

Used by the Log Diff math function.

Example	The following example is for the Swept SA measurement Set Trace 3 to Log Diff trace math function, set the First Trace operand (for Trace 3) to Trace 1, set the Second Trace operand (for Trace 3) to Trace 2, and set the Log Difference reference (for Trace 3) to -6 dBm: `:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00`
State Saved	The Log Difference reference value for each trace is saved in instrument state
Min/Max	Same as reference level

3.2.10.4 Detector

Lets you choose and configure detectors for the selected trace.

Detector

Selects a detector to be used by the instrument for the current measurement. The following choices are available:

Option	Parameter	Detector Behavior
Auto	n/a	The detector selected depends on marker functions, trace

Option	Parameter	Detector Behavior
		functions, average type, and the trace averaging function This option is set using "Detector Select Auto/Man" on page 343
Normal	`NORMal`	The detector determines the peak of the CW-like signals, and it yields alternating maximums and minimums of noise-like signals. This is also referred to as Rosenfell detection
Average	`AVERage`	The detector determines the average of the signal within the sweep points, using RMS averaging
Peak (Positive)	`POSitive`	The detector determines the maximum of the signal within the sweep points
Sample	`SAMPle`	The detector indicates the instantaneous level of the signal at the center of the sweep points represented by each display point
Negative Peak	`NEGative`	The detector determines the minimum of the signal within the sweep points
RMS	`RMS`	Equivalent to **Average**. See Notes below

Because they may not find a spectral component's true peak, neither **Average** nor **Sample** detectors measure amplitudes of CW signals as accurately as **Peak** or **Normal**, but they do measure noise without the biases of peak detection.

Remote Command

```
[:SENSe]:CHPower:DETector[:FUNCtion] NORMal | AVERage | POSitive | SAMPle |
NEGative | RMS
```

```
[:SENSe]:CHPower:DETector[:FUNCtion]?
```

Example

```
:CHP:DET NORM
```

```
:CHP:DET?
```

Set the detector to **Average**, which uses RMS averaging, so this is equivalent to selecting an `RMS` detector:

```
:CHP:DET RMS
```

Notes

The query returns a name that corresponds to the detector type, as shown below

The `RMS` selection sets the detector type to `AVERage` with `RMS` averaging. Therefore, if `RMS` has been selected, the query returns `AVER`

String Returned	Definition
`NORM`	Normal
`AVER`	Average (RMS)
`POS`	Peak
`SAMP`	Sample
`NEG`	Negative Peak

Couplings

When the **Detector** setting is **Auto**, switches to align with "Trace Type" on page 2137:

- `NORMal` with Clear Write
- `AVERage` with `AVERage`

	– `POSitive` (peak) with `MAXHold` – `NEGative` (peak) with `MINHold`
Preset	`AVERage`
State Saved	Saved in instrument state
Range	`NORMal|AVERage|POSitive|SAMPle|NEGative|RMS`

Detector Select Auto/Man

Sets the Detector mode to **Auto** or **Manual**. In **Auto**, the proper detector is chosen based on rules that take into account the measurement settings and other instrument settings.

When you select any detector explicitly, this setting switches automatically to **Man** (manual).

Remote Command	`[:SENSe]:CHPower:DETector:AUTO ON	OFF	1	0` `[:SENSe]:CHPower:DETector:AUTO?`
Example	`:CHP:DET:AUTO ON` `:CHP:DET:AUTO?`
Couplings	When the **Detector** setting is **Auto**, switches to align with "Trace Type" on page 2137: – `NORMal` with Clear Write – `AVERage` with `AVERage` – `POSitive` (peak) with `MAXHold` – `NEGative` (peak) with `MINHold`
Preset	`ON`
State Saved	Yes

3.2.10.5 Trace Function

Contains controls to:

- Copy and Exchange traces
- Preset or Clear all traces

From Trace

Selects the trace to be copied to or exchanged with the "To Trace" on page 1153 when a "Copy" on page 1153 or "Exchange" on page 1154 is performed

Preset	1

To Trace

Selects the trace to be copied from or exchanged with the **"From Trace" on page 1153** when a "Copy" on page 1153 or "Exchange" on page 1154 is performed

Preset	2

Copy

Executes a Trace Copy based on the "From Trace" on page 1153 and "To Trace" on page 1153 parameters. The copy operation is from the **From Trace** to the **To Trace**. The action is performed once.

The X-Axis settings and domain of a trace are also copied.

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe:COPY TRACE1 | … | TRACE6, TRACE1 | … | TRACE6`
	For all other measurements:
	`:TRACe:<meas>:COPY TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
	where `<meas>` is the identifier for the current measurement
	Note that the format of the `TRACe<n>` parameter differs from that for the Swept SA Measurement

Example	Copy Trace 1 to Trace 3 and put Trace 3 in Update=Off, Display=On `:TRAC:COPY TRACE1,TRACE3`
Notes	The command is of the form: `:TRACe:COPY <source_trace>,<dest_trace>`
Dependencies	When Signal ID is on, this key is grayed-out
Couplings	The destination trace is put in **View** (Update = Off, Display = On) after the copy

Preset	For Swept SA Measurement (in SA Mode):
	`TRACE1, TRACE2`
	For all other measurements:
	`TRACe1, TRACe2`

Exchange

Executes a Trace Exchange based on the "From Trace" on page 1153 and "To Trace" on page 1153 parameters. The **From Trace** and **To Trace** values are exchanged with each other. The action is performed once.

The X-Axis settings and domain of a trace are also copied when it is exchanged with another trace.

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe:EXCHange TRACE1 | … | TRACE6, TRACE1 | … | TRACE6`
	For all other measurements:
	`:TRACe:<meas>:EXCHange TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
	where `<meas>` is the identifier for the current measurement
	Note that the format of the `:TRACe<n>` parameter differs from that for the Swept SA Measurement

Example	Exchange Trace 1 and Trace 2 and put both traces in Update=`OFF`, Display=`ON`: `:TRAC:EXCH TRACE1,TRACE2`
Notes	The command is of the form: `:TRACe:EXCHange <trace_1>,<trace_2>`
Couplings	Both traces are put in **View** (Update=Off, Display=On) after the exchange

Preset All Traces

Turns on Trace 1 and blanks all other traces. This is useful when you have many traces on and you want to return to having only Trace 1 on the display. Does not affect the trace type, detector or any other aspect of the trace system.

Remote Command	`:TRACe[:<meas>]:PRESet:ALL`
Example	`:TRAC:PRES:ALL`
Dependencies	When Signal ID is on, this key is grayed-out

Clear All Traces

Clears all traces. Does not affect the state of any function or variable in the instrument. Loads `mintracevalue` into all of the points for all traces, except traces in **Min Hold**, in which case it loads `maxtracevalue`, even if **Update** = `OFF`.

Remote Command	`:TRACe[:<meas>]:CLEar:ALL`
Example	`:TRAC:CLE:ALL`
Dependencies	When Signal ID is on, this key is grayed-out

3.2.10.6 Advanced

Contains controls for setting advanced trace functions of the instrument.

Measure Trace

Specifies which trace’s scalar results are displayed in the **Metrics** window, and retrieved by sending a `:READ` or `:FETCh` query:

- Trace 1
- Trace 2
- Trace 3

Remote Command	`:CALCulate:<meas>:MTRace TRACe1 | TRACe2 | TRACe3`
	`:CALCulate:<meas>:MTRace?`
	`<meas>` is the identifier for the current measurement; any one of `CHPower | ACPower | OBWidth | SEMask | SPURious | PVTime`

Example	Channel Power
	`:CALC:CHP:MTR TRAC1`
	`:CALC:CHP:MTR?`

Dependencies	In the ACP measurement, this control is grayed-out when **Meas Method** is set to `RBW` or `FAST`, and only Trace 1 is enabled
Preset	`TRACe1`
State Saved	No
Range	Trace 1 | Trace 2 | Trace 3

3.3 Occupied BW Measurement

This measurement computes and displays the bandwidth occupied by a given percentage of the total mean power of a signal.

Measurement Commands

The general functionality of "CONFigure" on page 2997, "INITiate" on page 2998, "FETCh" on page 2998, "MEASure" on page 3000, and "READ" on page 2999 are described in the section **SCPI Operation and Results Query** in the topic **Programming the Instrument**.

Note that, in general, `:CONF:<Measurement>` resets the specified measurement settings to their defaults. X-Series permits the addition of the `NDEFault` node to the command, which prevents a measurement preset after a measurement switch.

The tables below list setup commands for this measurement and queries to retrieve results.

Command	Function
`:INITiate:OBWidth`	Initiates a trigger cycle for the `OBW` measurement, but does not return any data. You must then use `:FETC:OBW[n]?` to retrieve data Does not change any measurement settings
`:CONFigure?`	Returns the long form name of current measurement, in this case, `OBWidth`
`:CONFigure:OBWidth`	Selects `OBW` measurement with Meas Setup settings in preset state – same as Meas Preset
`:CONFigure:OBWidth:NDEFault`	Selects `OBW` measurement *without* affecting settings

The following queries are used to retrieve data. The type of data returned depends on the value of `n`, as detailed in "Remote Command Results" on page 348.

Command	Function
`:FETCh:OBWidth[n]?`	Retrieves the data defined by `n`
`:MEASure:OBWidth[n]?`	Switches to `OBW` measurement, restores default values, starts the measurement, then retrieves the data defined by `n`
`:READ:OBWidth[n]?`	Starts the measurement, then retrieves the data defined by `n`

Backwards Compatibility Queries

Command	Return Value

`:FETCh:OBWidth:OBWidth?`
`:MEASure:OBWidth:OBWidth?`
`:READ:OBWidth:OBWidth?`
	Returns the Occupied Bandwidth (Hz)

Command	Return Value

`:FETCh:OBWidth:FERRor?`
`:MEASure:OBWidth:FERRor?`
`:READ:OBWidth:FERRor?`
	Returns the Transmit Frequency Error (Hz)

`:FETCh:OBWidth:XDB?`
`:MEASure:OBWidth:XDB?`
`:READ:OBWidth:XDB?`
	Returns the xdB Bandwidth (Hz)

Remote Command Results

The following table describes the results returned by the `FETCh`, `MEASure`, and `READ` queries listed above, according to the index value `n`.

<table>
<tr><th>n</th><th>Results Returned</th></tr>
<tr><td>1, <i>or</i> not specified</td><td>Returns scalar results, in the following order:
<table>
<tr><th>#</th><th>Item</th><th>Unit</th></tr>
<tr><td>1</td><td>Occupied Bandwidth</td><td>Hz</td></tr>
<tr><td>2</td><td>Total Power <i>or</i> OBW Power
Power reference type can be changed with "Power Ref" on page 420 in Meas Setup</td><td>dBm</td></tr>
<tr><td>3</td><td>Span</td><td>Hz</td></tr>
<tr><td>4</td><td>Spectrum Trace Points</td><td>points</td></tr>
<tr><td>5</td><td>Res BW</td><td>Hz</td></tr>
<tr><td>6</td><td>Transmit Frequency Error</td><td>Hz</td></tr>
<tr><td>7</td><td>7. x dB Bandwidth</td><td>Hz</td></tr>
</table></td></tr>
<tr><td>2</td><td>Returns the frequency-domain spectrum trace (data array) for the entire frequency range being measured for Trace 1</td></tr>
<tr><td>3</td><td>Only available in LTEAFDD, LTEATDD, 5GNR Modes
1. Number of active carriers
Returns number of active carriers within Span in Auto detected mode, otherwise the command is out of scope</td></tr>
<tr><td>4</td><td>Returns OBW Boundaries table results in the following order:
<table>
<tr><th>#</th><th>Item</th><th>Unit, if any</th></tr>
<tr><td>1</td><td>Occupied bandwidth</td><td>Hz</td></tr>
<tr><td>2</td><td>Total Power or OBW Power

<tr><td>24</td><td>`NaN` (9.91E+37)</td><td>-</td></tr>
</table>
Results 6, 7, 8, 20 and 24 always return `NaN` (9.91E+37)</td></tr>
<tr><td>5</td><td>Returns the frequency-domain spectrum trace (data array) for the entire frequency range being measured for Trace 2</td></tr>
<tr><td>6</td><td>Returns the frequency-domain spectrum trace (data array) for the entire frequency range being measured for Trace 3</td></tr>
</table>

3.3.1 Views

This measurement has three predefined views:

Name	SCPI Name	SCPI #
"OBW Results" on page 350	`OBWResults`	1

Name	SCPI Name	SCPI #
"OBW Boundaries" on page 351	`BOUNdaries`	2
"Gate" on page 351	See "Gate View On/Off" on page 2915	

These are multiple-window views. When in a multiple-window view, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Whenever the **View** changes, the default menu is **Frequency**, unless otherwise specified in the **View** description.

The following SCPI commands can be used to select any view other than **Gate**.

View Selection by Name

Remote Command	`:DISPlay:OBWidth:VIEW[:SELect] OBWResults | BOUNdaries` `:DISPlay:OBWidth:VIEW[:SELect]?`
Example	`:DISP:OBW:VIEW OBWR` `:DISP:OBW:VIEW?`
Preset	`OBWResults`
State Saved	Saved in instrument state
Range	`OBWResults|BOUNdaries`

View Selection by Number

Remote Command	`:DISPlay:OBWidth:VIEW:NSELect <integer>` `:DISPlay:OBWidth:VIEW:NSELect?`
Example	`:DISP:OBW:VIEW:NSEL 2` `:DISP:OBW:VIEW:NSEL?`
Preset	1
State Saved	Saved in instrument state
Min/Max	1/2

3.3.1.1 OBW Results

Windows: "Graph" on page 351, "Metrics - OBW Results" on page 352

The spectrum trace is displayed in the upper window. Measurement results such as Occupied Bandwidth or Power are displayed in the lower window.

Example	`:DISP:OBW:VIEW OBWR`

3.3.1.2 OBW Boundaries

Windows: "Graph" on page 351, "Metrics - OBW Boundaries" on page 354

The spectrum trace is displayed in the upper window. The lower window of OBW Results view is replaced by the OBW boundaries table in this view. Occupied bandwidth and X dB bandwidth for both lower and upper boundaries are displayed.

Example	`:DISP:OBW:VIEW BOUN`

3.3.1.3 Gate

See "Gate View On/Off" on page 2915

3.3.2 Windows

There are four available window types. The **Gate** window is available only when "Gate View On/Off" on page 2915 is `ON` in the **Gate Settings** menu under **Trigger**.

View	#
"Graph" on page 351	1
"OBW Results" on page 350	2
"OBW Boundaries" on page 351	3
"Gate" on page 355	4

3.3.2.1 Graph

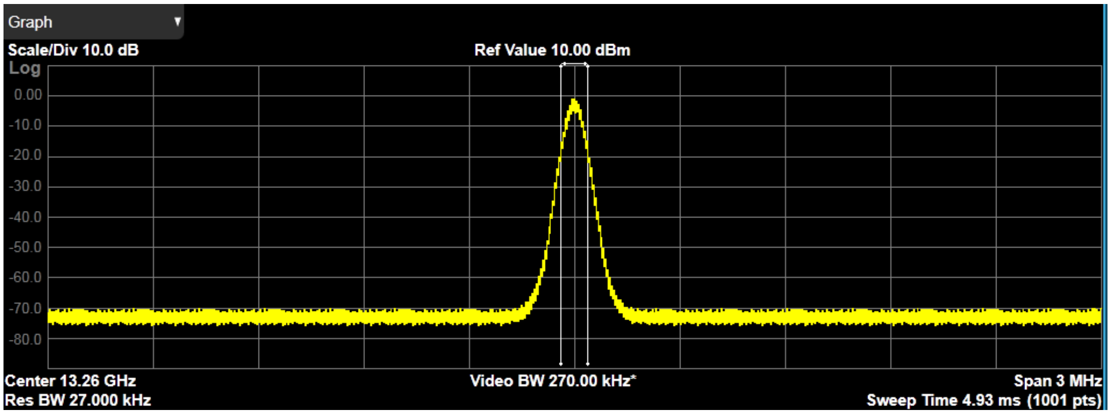
Window #1

Appears in two Views, as follows:

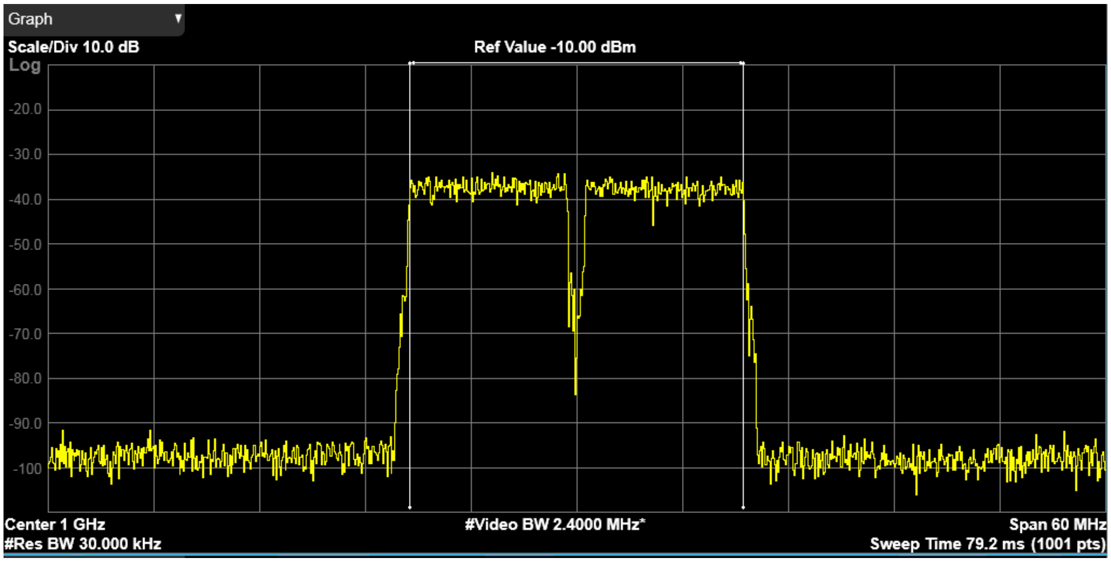
View	Size	Position
"OBW Results" on page 350	Three fifth, full width	Top
"OBW Boundaries" on page 351	Half, full width	Top

Spectrum View

For SA, WCDMA, WLAN mode:



For LTE-Advanced FDD/TDD mode only



3.3.2.2 Metrics - OBW Results

Window #2

Displays the textual results of the Occupied BW measurement.

View	Size	Position
"OBW Results" on page 350	Two fifth, full width	Bottom
Gate	One third, full width	Bottom

Occupied Bandwidth 2.9730 MHz
Transmit Freq Error 0 Hz
x dB Bandwidth 3.000 MHz
Total Power 20.2 dBm
% of OBW Power 99.00 %
x dB -26.00 dB

For the LTE-Advanced FDD/TDD and 5G NR modes, the metric result is shown as below:

Measure Trace Trace 1
Occupied Bandwidth 2.9730 MHz
Transmit Freq Error 0 Hz
x dB Bandwidth 3.000 MHz
Total Power 20.2 dBm
% of OBW Power 99.00 %
x dB -26.00 dB

Occupied Bandwidth

The occupied bandwidth result is $f_2 - f_1$, where f_1 and f_2 are the lower and upper carrier boundary point. f_1 and f_2 are calculated with Occupied Bandwidth algorithms.

Total Power or OBW Power

The total power is the power integrated in the specified span setting. The OBW power is calculated from multiplying the total power by OBW percent power. The user can select the total power or the OBW power with the Power Ref control in Meas Setup.

Transmit Freq Error

The transmit freq error (transmit frequency error) result is calculated as the difference between $(f_2+f_1)/2$ and the tuned center frequency of the signal, where f_1 and f_2 are the lower and upper carrier boundary point.

x dB Bandwidth

The x dB result is a bandwidth measured between two points on the signal which are a certain number of dBs down from the highest signal point within the OBW Span. For example, If the ‘x dB’ parameter is set to –26 dB, and the ‘Occupied BW Span’ is set to 10 MHz, then the maximum signal power level is first determined from the 10 MHz wide trace sweep. Next, the two furthest frequencies below (xdb_f_1) and above (xdb_f_2) the frequency of the maximum level occurrence are found where the signal level is 26 dB below the peak level. This calculation also uses linear interpolation to find the lower and upper carrier boundary point within the width of a sweep point (the span divided by the number of sweep points).

The x dB bandwidth is calculated to be xdb_f2 – xdb_f1.

% of OBW Power

This is the setting parameter. See "% of OBW Power" on page 420

x dB

This is the setting parameter. See "x dB" on page 421.

Active Carriers

In the LTE-Advanced FDD/TDD and 5G NR modes, the number of active carriers is displayed to show how many carriers are identified as active in auto detected mode of span, otherwise “-” is displayed to indicate that it is out of scope. When there is one active carrier, Transmit Freq Error is displayed. Otherwise, “---“ is displayed.

Measure Trace

See "Measure Trace" on page 1155.

3.3.2.3 Metrics - OBW Boundaries

Window #3

Displays occupied bandwidth and X dB bandwidth for both lower and upper boundaries.

View	Size	Position
"OBW Boundaries" on page 351	Half, full width	Bottom
Gate	One third, full width	Bottom

Occupied Bandwidth
2.9730 MHz

Total Power	20.2 dBm

x dB Reference	
x dB	-26.00 dB
Power	0.00 dBm
Offset Frequency	-1.5000 MHz

	Lower Boundary			Upper Boundary		
	Offset Freq	Abs Power	Rel Power	Offset Freq	Abs Power	Rel Power
Occupied Bandwidth	-1.4865 MHz	0.00 dBm	-20.2 dBc	1.4865 MHz	0.00 dBm	-20.2 dBc
x dB Bandwidth	-1.5000 MHz	-26.0 dBm		1.5000 MHz	-26.0 dBm	

Occupied Bandwidth

The occupied bandwidth result is $f_2 - f_1$, where f_1 and f_2 are the lower and upper carrier boundary point. f_1 and f_2 are calculated with Occupied Bandwidth algorithms.

Total Power or OBW Power

Total Power is the power integrated in the specified span setting. OBW Power is calculated from multiplying the total power by OBW percent power. The user can select the total power or the OBW power with the Power Ref control in Meas Setup.

x dB

This is the setting parameter. See "x dB" on page 421.

x dB Ref Pwr

The x dB reference power result shows the power of the highest signal point within the OBW Span.

x dB At Freq

The x dB reference power frequency result shows the frequency of the highest signal point within the OBW Span. The frequency display type, either Offset or Absolute, can be selected with the Boundary Frequency control under Display.

OBW Boundary Results

Name	Unit	Corresponding Results
Lower OBW boundary - offset frequency	Hz	Offset frequency of the lower OBW boundary from center frequency
Lower OBW boundary - absolute power	dB	Absolute power on the point of lower OBW boundary
Lower OBW boundary - relative power	dBc	Relative power on the point of lower OBW boundary
Upper OBW boundary - offset frequency	Hz	Offset frequency of the upper OBW boundary from center frequency
Upper OBW boundary - absolute power	dB	Absolute power on the point of upper OBW boundary
Upper OBW boundary - relative power	dBc	Relative power on the point of upper OBW boundary
Lower x dB BW boundary - offset frequency	Hz	Offset frequency of the lower x dB BW boundary from center frequency
Lower x dB BW boundary - absolute power	dB	Absolute power on the point of lower x dB BW boundary
Upper x dB BW boundary - offset frequency	Hz	Offset frequency of the lower x dB BW boundary from center frequency
Upper x dB BW boundary - absolute power	dB	Absolute power on the point of lower x dB BW boundary

3.3.2.4 Gate

Window #4

Turning on **Gate** View shows the **Gate** Window, which lets you see your Gating signal at the same time as the measured data. See the description in "Gate View On/Off" on page 2915 under **Trigger**, **Gate Settings**.

Views in which this window appears:

View	Size	Position
Gate	One third, full width	Top

3.3.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.3.3.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The reference line is at the top, center, or bottom of the graticule, depending on the value of the Ref Position function.

Remote Command	`:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:RLEVel <real>` `:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:RLEVel?`
Example	`:DISP:OBW:WIND:TRAC:Y:RLEV 125` `:DISP:OBW:WIND:TRAC:Y:RLEV?`
Couplings	When "Auto Scaling" on page 358 is ON (default), this value is automatically determined by the measurement result. When you set a value manually, **Auto Scaling** changes to `OFF` "Attenuation" on page 2158 is not coupled to **Ref Value**
Preset	10.00 dBm
State Saved	Saved in instrument state
Min/Max	-250.00 dBm / 250.00 dBm
Annotation	Ref <value> top left of graph
Backwards Compatibility SCPI	`:DISPlay:OBWidth:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RLEVel`

Scale/Div

For measurements that support a logarithmic Y-Axis, **Scale/Div** sets the height of one division of the graticule in the current Y-Axis unit.

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule division on the display, the total amplitude range of the graph is typically 10x this amount. For example, if Scale/Div is 10 dB, then the total range of the graph is 100 dB.

Remote Command	`:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:PDIVision <rel_ampl>` `:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:PDIVision?`
Example	`:DISP:OBW:WIND:TRAC:Y:PDIV 5` `:DISP:OBW:WIND:TRAC:Y:PDIV?`
Couplings	Coupled to Scale Range as follows Scale/Div = Scale Range/10 (number of divisions) When the Auto Scaling is On, this value is automatically determined by the measurement result When you change a value, Auto Scaling automatically changes to Off
Preset	10.00 dB / Div
State Saved	Saved in instrument state
Min	0.10 dB
Max	20 dB
Annotation	<value> dB/ left upper of graph
Backwards Compatibility SCPI	`:DISPlay:OBWidth:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PDIVision`

Scale Range

Sets the Y-Axis scale range.

Remote Command	Replace `<meas>` with the identifier for the current measurement
	`:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe <rel_ampl>`
	`:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe?`

Example	`:DISP:CHP:WIND:TRAC:Y:RANG 100` `:DISP:CHP:WIND:TRAC:Y:RANG?`
Couplings	Coupled to **Scale/Div** as follows **Scale Range** = **Scale/Div** * 10 (number of divisions) When you change this value, **Auto Scaling** automatically changes to `OFF`
Preset	100 dB
State Saved	Saved in instrument state
Min	1
Max	200

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change the reference level value.

Remote Command	`:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:RPOSition TOP | CENTer | BOTTom` `:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:RPOSition?`
Example	`:DISP:OBW:WIND:TRAC:Y:RPOS CENT` `:DISP:OBW:WIND:TRAC:Y:RPOS?`
Preset	`TOP`
State Saved	Saved in instrument state
Range	`TOP|CENTer|BOTTom`
Annotation	The greater than (>) and less than (<) symbols are displayed on both sides of the graph to indicate the Reference Position
Backwards Compatibility SCPI	`:DISPlay:OBWidth:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RPOSition`

Auto Scaling

Toggles **Auto Scaling** On or Off.

Remote Command	`:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:COUPle 0 | 1 | OFF | ON` `:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:COUPle?`
Example	`:DISP:OBW:WIND:TRAC:Y:COUP OFF` `:DISP:OBW:WIND:TRAC:Y:COUP?`
Couplings	When **Auto Scaling** is `ON`, and the **Restart** front-panel key is pressed, this function automatically sets the scale per division to 10 dB and determines the reference values based on the measurement results When you change a value of "Scale/Div" on page 356, "Ref Value" on page 356, or "Scale Range" on page 1002, **Auto Scaling** automatically changes to `OFF`
Preset	1
State Saved	Saved in instrument state
Range	`OFF|ON`
Backwards Compatibility SCPI	`:DISPlay:OBWidth:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:COUPle`

3.3.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See "Dual-Attenuator Configurations" on page 359
- See "Single-Attenuator Configuration" on page 360

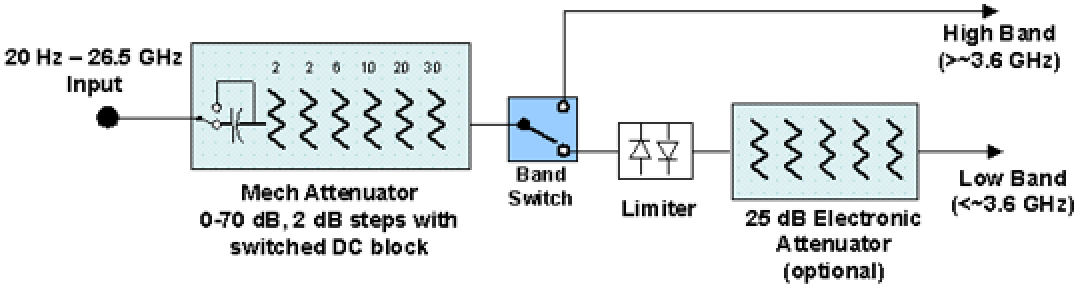
Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9420A/10A/11A/15A/16A, M9410E/11E/15E/16E, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

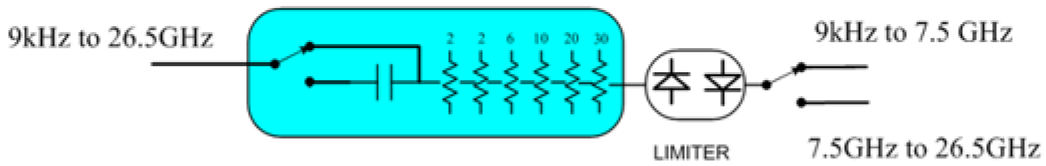
Dependencies	In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the **Range** tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

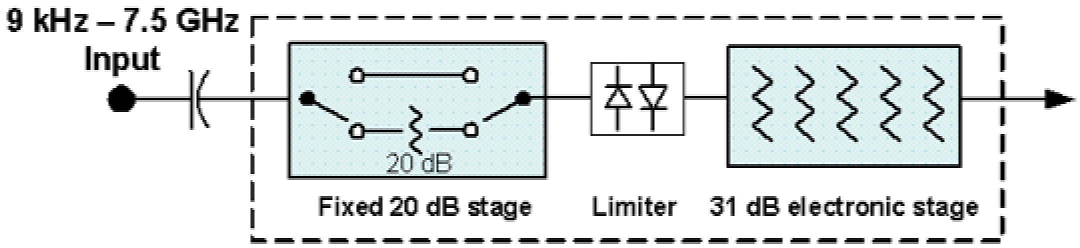


Configuration 2: Mechanical attenuator, no optional electronic attenuator

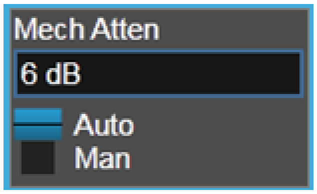


Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

Single-Attenuator Configuration

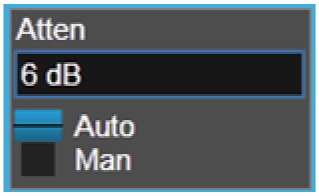


You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.



Mech Atten
6 dB

Dual Attenuator



Atten
6 dB

Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	`[:SENSe]:POWer[:RF]:FRATten <rel_ampl>` `[:SENSe]:POWer[:RF]:FRATten?`
Example	`:POW:FRAT 14` `:POW:FRAT?`
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See **Reference Level** and "Mech Atten" on page 2161 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	When the **Input** is **RF**, and the **Input Port** is **RF Input 2**, and the Full Range Attenuator is installed: On the Meas Bar, the field "Atten" displays as follows: – If the sweep is entirely < 50 GHz, the value shown after "Atten:" is equal to Mech Atten + Elec Atten + Full Range Atten – If the sweep is entirely > 50 GHz, the value shown after "Atten:" is equal to Full Range Atten – If the sweep straddles 50 GHz, the value shown after "Atten:" is preceded by the symbol ">=" and is equal to Full Range Atten In the **Amplitude**, "Y Scale" on page 2153 menu, and the Atten **Meas Bar** dropdown menu panel, a summary is displayed as follows: "Total Atten below 50 GHz" followed by the value of Full Range Atten + Mech Atten + Elec Atten "Total Atten above 50 GHz" followed by the value of Full Range Atten For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown: – Attenuator summary: – Total Atten below 50 GHz: 30 dB – Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models, and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to **Ref Level**, "Internal Preamp" on page 2183 Gain, any External Gain that is entered, and **Max Mixer Level** (if available), as described in the table below.

See "Attenuator Configurations and Auto/Man" on page 364

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation <rel_ampl>` `[:SENSe]:POWer[:RF]:ATTenuation?`
Example	`:POW:ATT 20` Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of “main” attenuation) In either case, if the attenuator was in Auto, it is set to Manual
Dependencies	Some measurements do not support **Auto** setting of **Mech Atten**. In these measurements, the **Auto/Man** selection is not available, and the **Auto/Man** toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the **Auto/Man** toggle function is not available. The state of **Auto/Man** is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 2164 See "Attenuator Configurations and Auto/Man" on page 364 for more information on the **Auto/Man** functionality
Couplings	If the RF Input Port is the RF Input: – If the USB Preamp is connected to USB, use 0 dB for **Mech Atten** – Otherwise compute the auto-selected value of **Mech Atten** based on **Reference Level**, **Int Preamp**, **External Gain**, **Ref Level Offset**, **Max Mixer Level**, **µW Path Control** and **IF Gain** settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) – In N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the value of "Full Range Atten" on page 2160 from the result to determine the **Mech Atten**. Limit the value so that it is never lower than 0 dB and so that total attenuation, including **Full Range Atten**, is never less than 6 dB (total attenuation, including **Full Range Atten** below 6 dB, can never be chosen by Auto) In External Mixing and BBIQ, where the attenuator is not in the signal path, the attenuator setting changes as described above when **Mech Atten** is in **Auto**, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input For CXA-m with Option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is <= 7.5 GHz. So, when the frequency is changed from below

	7.5 GHz to above 7.5 GHz, the attenuation setting changes to a multiple of 10 dB that is no smaller than the previous setting. For example, 4 dB attenuation changes to 10 dB
Preset	**Auto** The Auto value is 10 dB
State Saved	Saved in instrument state
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased
Max	CXA Option 503 or 507: 50 dB EXA: 60 dB All other models: 70 dB Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as: *Atten: <total> dB (e<elec>)* The e letter is in amber in Single-Attenuator configurations For example: Dual-Attenuator configuration: *Atten: 24 dB (e14)* Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB Single-Attenuator configuration: *A: 24 dB (e14)* Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation) When in Manual, a # sign appears in front of Atten in the annotation

Auto Function

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:ATTenuation:AUTO?`
Example	Turn **Auto Mech Atten**ON: `:POW:ATT:AUTO ON`
Dependencies	`:POW:ATT:AUTO` is only available in measurements that support **Auto**, such as Swept SA
Preset	ON

Attenuator Configurations and Auto/Man

As described under "Attenuation" on page 2158, there are two distinct attenuator configurations available in the X-Series, the Single Attenuator and Dual-Attenuator configurations.

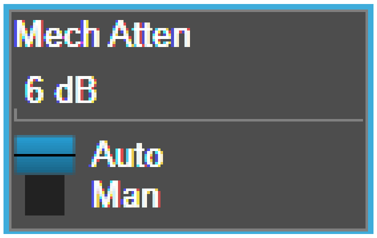
In Dual-Attenuator configurations, we have mechanical attenuation and electronic attenuation, and current total attenuation is the sum of electronic + mechanical attenuation.

In Single-Attenuator configurations, we refer to the attenuation set using "Mech Atten" on page 362 (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then current total attenuation is the sum of main + soft attenuation.

See "Elec Atten" on page 2164 for more about “soft” attenuation.

NOTE

In some measurements, the **Mech Atten** control has an **Auto/Man** function. In these measurements, an **Auto/Man** switch is shown on the **Mech Atten** control:



Mech Atten
6 dB

Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no **Auto/Man** function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten
10 dB

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details of the Electronic Attenuator, see "More Information" on page 366

Remote Command	`[:SENSe]:POWer[:RF]:EATTenuation <rel_ampl>` `[:SENSe]:POWer[:RF]:EATTenuation?`
Example	`:POW:EATT 10` `:POW:EATT?`
Notes	Electronic Attenuation's specification is defined only when **Mech Atten** is 6 dB
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no "electronic attenuator"; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, `EATT` SCPI commands are accepted for compatibility with other X-series instruments, and set a "soft" attenuation. The "soft" attenuation is treated as an addition to the "main" attenuation value set by the **Attenuation** control or `:POW:ATT`, and affects the total attenuation displayed on the **Attenuation** control and the Meas Bar The electronic attenuator, and the "soft" attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out If "Internal Preamp" on page 2183 is `ON` (that is, set to Low Band or Full), the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned If both the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence If the electronic/soft Attenuator is enabled, then the **Stop Freq** of the instrument is limited to 3.6 GHz and **Internal Preamp** is unavailable If "LNA" on page 2185 is `ON`, the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out. This coupling works in the following modes/measurements: – Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes – Transmit On|Off Power measurement in 5GNR Mode – Power vs. Time and Transmit Power measurement in GSM/EDGE Mode – Burst Power measurement in Spectrum Analyzer Mode The SCPI-only "soft" electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement
Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in "Mechanical Attenuator

	Transition Rules" on page 367
Preset	0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the **Mech Atten** control description

Auto Function

Remote Command	`[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:EATTenuation:STATe?`
Example	`:POW:EATT:STAT ON` `:POW:EATT:STAT?`
Preset	`OFF` (Disabled) for Swept SA measurement `ON` (Enabled) for all other measurements that support the electronic attenuator

NOTE

The maximum **Center Frequency** for Low Band can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values <= 40 MHz have a maximum Low Band frequency of 3.6 GHz, while 40 MHz < IFBW <= 1 GHz have a maximum of 3.3 GHz, and 1 GHz < IFBW <= 1.5 GHz have a maximum of 3.5 GHz. This frequency is reflected in the disabled message displayed for Electrical Attenuator. For N9032B and N9042B IFBW values > 1.5 GHz do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, the Electrical Attenuator will remain disabled no matter the Center Frequency.

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See "Using the Electronic Attenuator: Pros and Cons" on page 368 for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the “soft” attenuation feature replaces the Dual-Attenuator configuration’s electronic attenuator. All the same couplings and limitations apply. See "Attenuator Configurations and Auto/Man" on page 2163

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled
- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "Pre-Adjust for Min Clipping" on page 2168.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Example	`:POW:RANG:OPT IMM`
Notes	Executing **Adjust Atten for Min Clipping** initiates the measurement
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate` is executed.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLy | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?`
Example	`:POW:RANG:OPT:TYPE EONL` `:POW:RANG:OPT:TYPE?`
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	`COMBined`
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is `ON`, it applies the adjustment described under "Adjust Atten for Min Clipping" on page 2167 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "Adjustment Algorithm" on page 370

Selection	SCPI	Note
Off	`OFF`	This is the default setting
On	`ON`	Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the `ON` parameter is supported and mapped to `COMBined`
Elec Atten Only	`ELECtrical`	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Elec+Mech Atten	`COMBined`	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Example	`:POW:RANG:OPT:ATT OFF` `:POW:RANG:OPT:ATT?`

Notes	The parameter option `ELECtrical` sets this function to `ON` in Single-Attenuator models The parameter option `COMBined` is mapped to `ELECtrical` in Single-Attenuator models. If you send `COMBined`, it sets the function to `ON` and returns `ELEC` to a query For SCPI compatibility with models that do not have an input attenuator, the `ON` parameter is honored and mapped to `COMBined`
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when "Elec Atten" on page 2164 is `OFF` or grayed-out, "Pre-Adjust for Min Clipping" on page 369 is grayed-out Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	`OFF` when Elec Atten is Disabled at preset, otherwise `ELEC`
State Saved	Saved in instrument state
Range	Dual-Attenuator models: Off | Elec Atten Only | Mech + Elec Atten Single-Attenuator models: Off | On

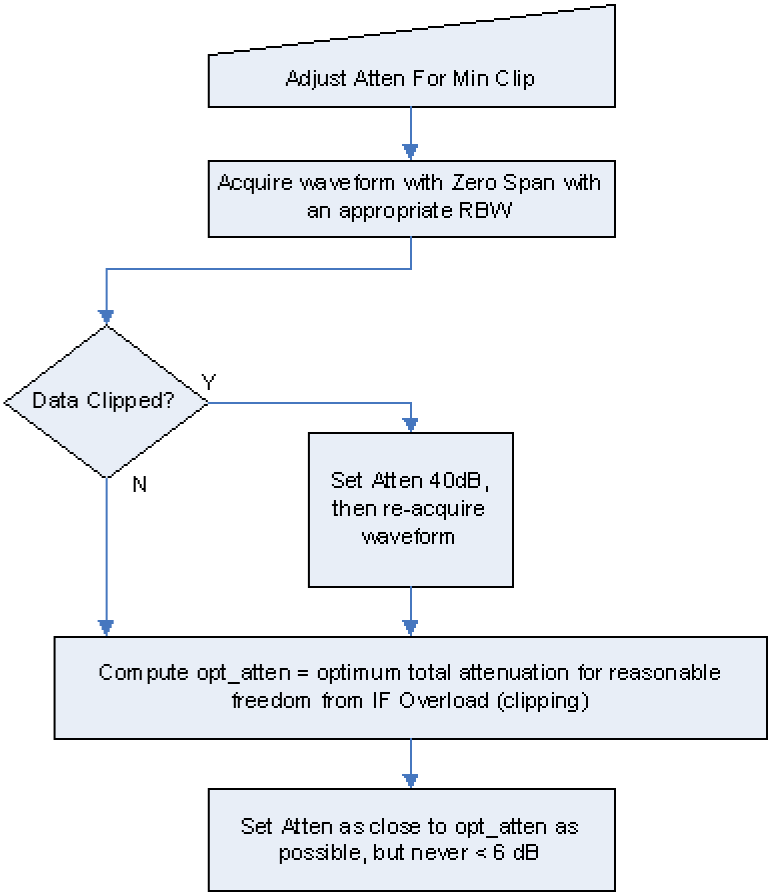
Backwards Compatibility Command

Notes	`ON` aliases to "Elec Atten Only" (`:POW:RANG:OPT:ATT ELEC`) `OFF` aliases to "Off" (`:POW:RANG:OPT:ATT OFF`) `:POW:RANG:AUTO?` returns true if `:POW:RANG:OPT:ATT` is not `OFF`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:RANGe:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:RANGe:AUTO?`

Adjustment Algorithm

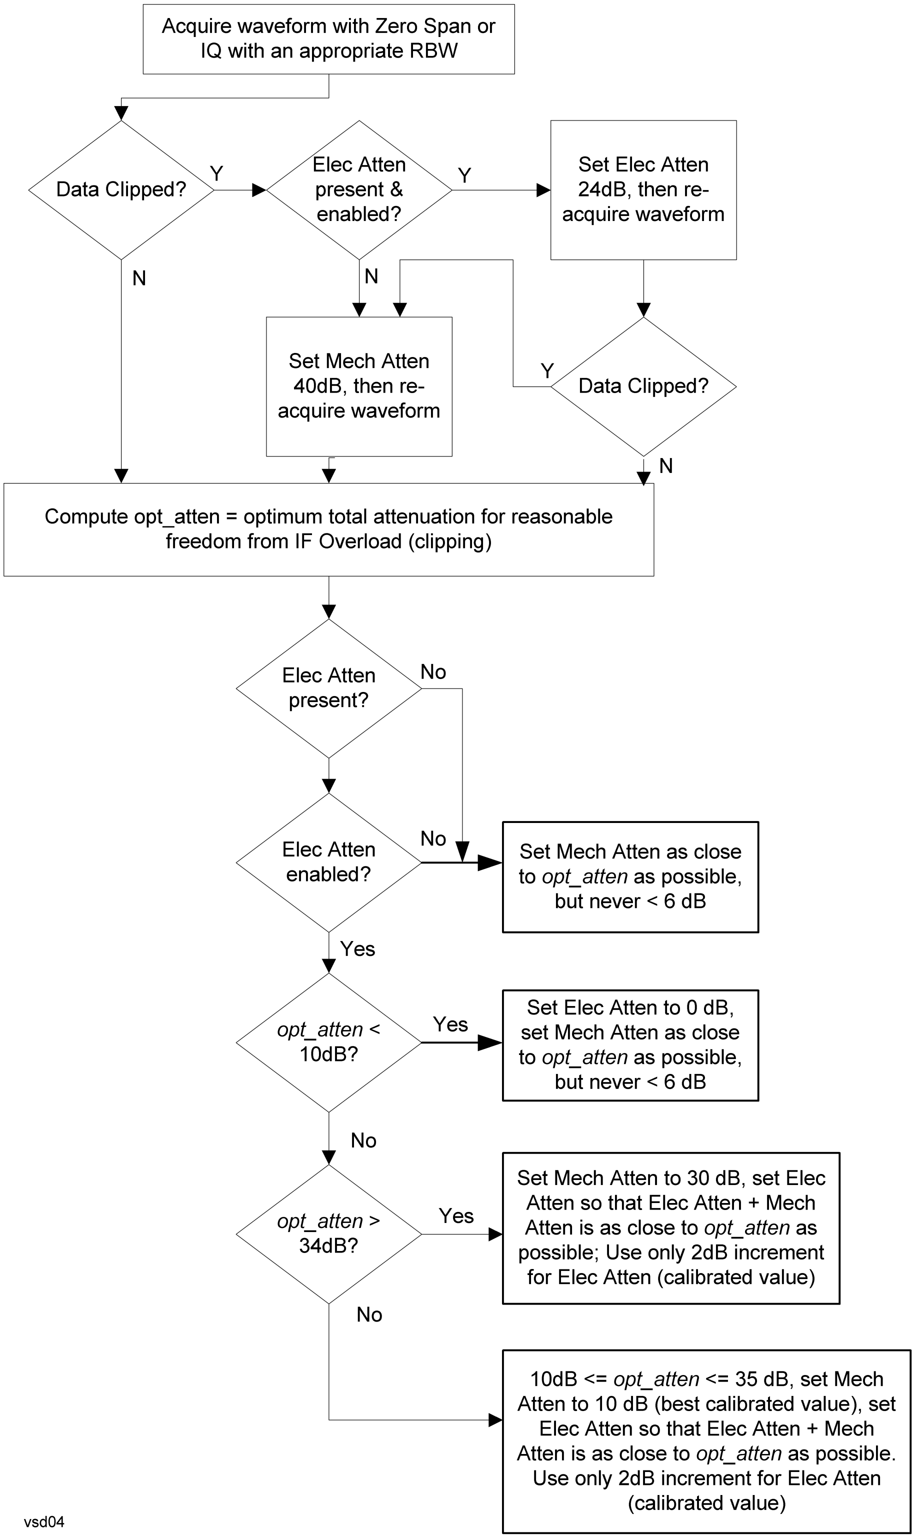
The algorithms for the adjustment are documented below:

Single-Attenuator Models



Dual-Attenuator models

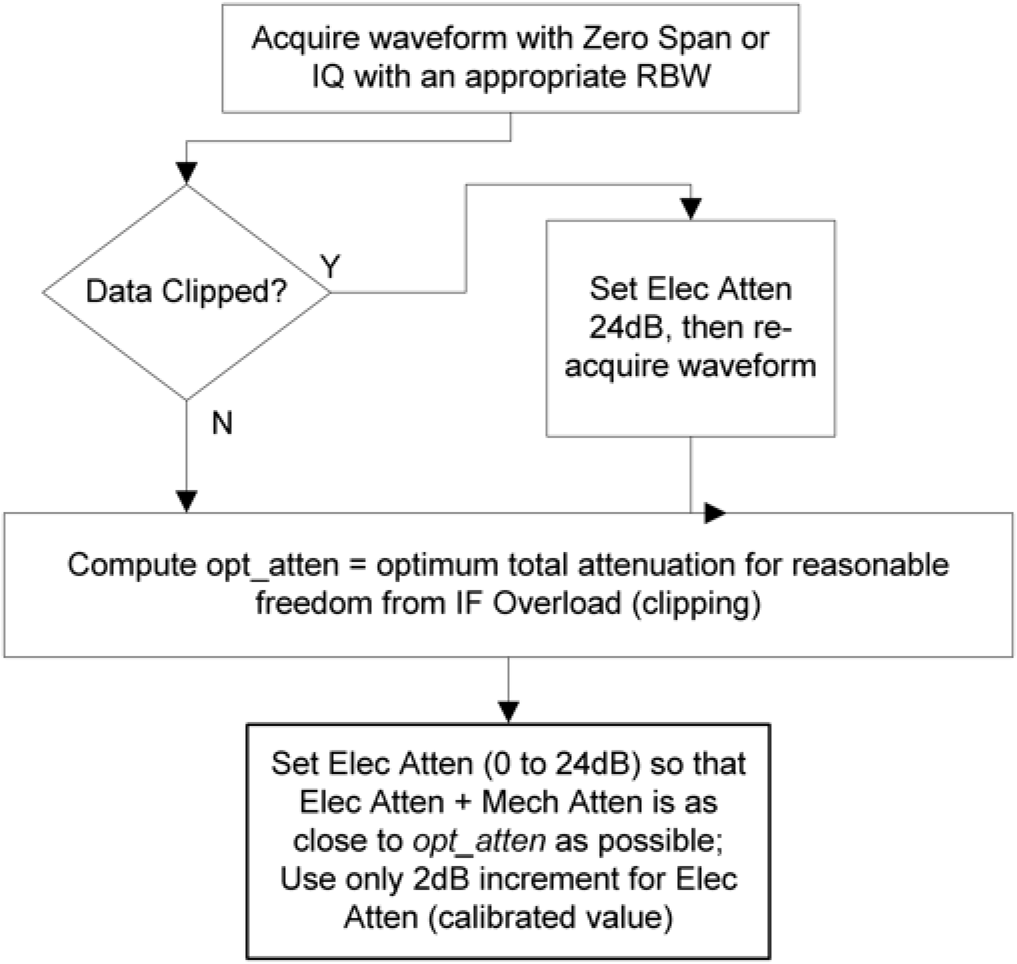
"Adjust Atten for Min Clipping" on page 2167 or "Pre-Adjust for Min Clipping" on page 369 selection is Mech + Elec Atten:



Acquire waveform with Zero Span or IQ with an appropriate RBW
Data Clipped?
Y
N
Elec Atten present & enabled?
Y
N
Set Elec Atten 24dB, then re-acquire waveform
Set Mech Atten 40dB, then re-acquire waveform
Data Clipped?
Y
N
Compute opt_atten = optimum total attenuation for reasonable freedom from IF Overload (clipping)
Elec Atten present?
No
Elec Atten enabled?
No
Yes
Set Mech Atten as close to opt_atten as possible, but never < 6 dB
opt_atten < 10dB?
Yes
No
Set Elec Atten to 0 dB, set Mech Atten as close to opt_atten as possible, but never < 6 dB
opt_atten > 34dB?
Yes
No
Set Mech Atten to 30 dB, set Elec Atten so that Elec Atten + Mech Atten is as close to opt_atten as possible; Use only 2dB increment for Elec Atten (calibrated value)
10dB <= opt_atten <= 35 dB, set Mech Atten to 10 dB (best calibrated value), set Elec Atten so that Elec Atten + Mech Atten is as close to opt_atten as possible. Use only 2dB increment for Elec Atten (calibrated value)
vsd04

"Pre-Adjust for Min Clipping" on page 369 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.



Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?`
Example	`:POW:ATT:STEP 2` `:POW:ATT:STEP?`
Notes	Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

3.3.3.3 Range (Non-attenuator models)

Only available for Keysight’s modular signal analyzers and certain other Keysight products, such as VXT and M941xE.

State Saved	No

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe <real>` `[:SENSe]:POWer[:RF]:RANGe?`
Example	`:POW:RANG 10 dBm` `:POW:RANG?`
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the **Center Frequency** The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min/Max	–/+100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements

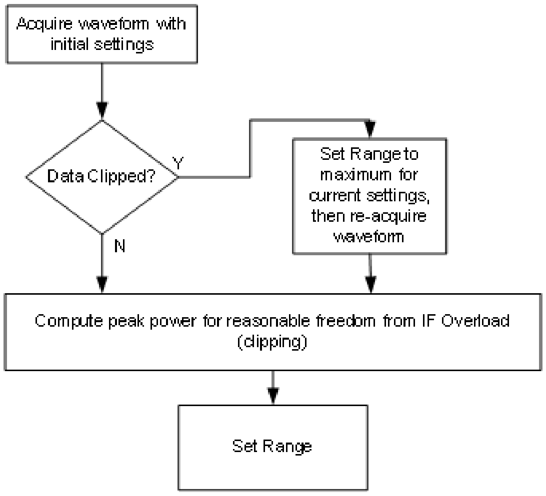
Pre-Adjust for Min Clipping

If this function is `ON`, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Notes	Because there is no attenuator control available in these models, the control displays only `ON` and `OFF` choices. However, for SCPI compatibility with other platforms, all three parameters (`ELECtrical`, `COMBined`, and `ON`) are honored and all are mapped to `ELECtrical`, so if any of these three parameters is sent, a subsequent query will return `ELEC`
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements
Preset	`OFF` for Swept SA measurement; `ON` for all other measurements that support **Pre-Adjust for Min Clipping**
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:



Peak-to-Average Ratio

Used with "Range (Non-attenuator models)" on page 2177 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:PARatio <real>` `[:SENSe]:POWer[:RF]:RANGe:PARatio?`	
Example	`:POW:RANG:PAR 12 dB`	
Notes	In some Modes, this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempts to change the value via SCPI are ignored, but no error message is generated	
Dependencies	Does not appear in Spectrum Analyzer Mode	
Preset	VXT Models M9410A/11A	0 dB
	All Others	10 dB
State Saved	Saved in instrument state	
Min	0 dB	
Max	VXT Models M9410A/11A	50 dB
	All Others	20 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "Peak-to-Average Ratio" on page 2179. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real>` `[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?`	
Example	`:POW:RANG:MIX:OFFS -5 dB`	
Preset	0 dB	
State Saved	Saved in instrument state	
Min	VXT Models M9410A/11A	-34 dB
	All Others	-35 dB
Max	30 dB	

3.3.3.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9420A, or UXM.

This tab *does* appear in VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E, because "Software Preselection" on page 2195 is under this tab, and VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range

between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "Preselector Adjust" on page 2182 changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in "Proper Preselector Operation" on page 378.

Remote Command	`[:SENSe]:POWer[:RF]:PCENter`
Example	`:POW:PCEN`
Notes	The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command
Dependencies	Does not appear in CXA-m, nor in VXT Models M9410A/11A/15A/16A, M9410E/11E/15E/16E Grayed-out if the microwave preselector is off – If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken – Grayed-out if entirely in Band 0, that is, if **Stop Freq** is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if **Start Freq** is above 50 GHz – Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 – Grayed-out in the **Spectrogram** View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering appears in "Preselector Adjust" on page 2182
Status Bits/OPC dependencies	When centering the preselector, `*OPC` does not return true until the process is complete and a subsequent measurement has completed, nor are results returned in response to `:READ` or `:MEASure` queries The `Measuring` bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak

search to find

2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "Presel Center" on page 2181 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	`[:SENSe]:POWer[:RF]:PADJust <freq>` `[:SENSe]:POWer[:RF]:PADJust?`
Example	`:POW:PADJ 100KHz` `:POW:PADJ?`
Notes	The value on the control is displayed to 0.1 MHz resolution
Dependencies	– Does not appear in CXA-m – Does not appear in VXT Models M9410A/11A/15A/16A – Does not appear in M9410E/11E/15E/16E – Grayed-out if microwave preselector is off – Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz – Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the **Spectrogram** View
Preset	0 MHz

State Saved	The **Preselector Adjust** value set by "Presel Center" on page 2181, or by manually adjusting **Preselector Adjust** Not saved in instrument state, and does not survive a Preset or power cycle
Min/Max	–/+500 MHz
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PADJust` `[:SENSe]:POWer[:RF]:MMW:PADJust`

Backwards Compatibility Command

Notes	The command has no effect, and the query always returns `MWAVe`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVe | MMWave | EXTernal` `[:SENSe]:POWer[:RF]:PADJust:PRESelector?`

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec’d below 9 kHz".

Selection	Example	Note
Off	:POW:GAIN OFF	
Low Band	:POW:GAIN ON :POW:GAIN:BAND LOW	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	:POW:GAIN ON :POW:GAIN:BAND FULL	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE The maximum **Center Frequency** for **Low Band**, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values <= 40 MHz have a maximum **Low Band** frequency of 3.6 GHz, while 40 MHz < IFBW <= 1 GHz have a maximum of 3.3 GHz, and 1 GHz < IFBW <= 1.5 GHz have a maximum of 3.5 GHz. IFBW values > 1.5 GHz do not support a **Center Frequency** that can reach the **Low Band** maximum frequency. In these cases, **N/A** is displayed in the square brackets for **Low Band**.

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:BAND LOW | FULL` `[:SENSe]:POWer[:RF]:GAIN:BAND?`
Example	`:POW:GAIN:BAND LOW` `:POW:GAIN:BAND?`
Dependencies	Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A nor in M9410E/11E/15E/16E If `:POW:GAIN:BAND FULL` is sent when a low band preamp is available, the preamp band parameter is set to `LOW` instead of `FULL`, and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled
Preset	`LOW`
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says “Off” if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says “3.6 GHz”. If it is a 13.6 GHz preamp and it is set to Full Range the annotation says “13.6 GHz” When the USB Preamp is connected to USB, the Preamp annotation says “Preamp: USB” if the internal preamp is off or “Preamp: USB, Int” if the internal preamp is on (only for measurements that support the USB preamp)

Auto Function

Remote Command	`[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN[:STATe]?`
Example	`:POW:GAIN OFF` `:POW:GAIN?`
Preset	`OFF`

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to "Internal Preamp" on page 2183. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

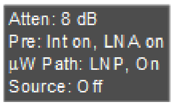
For best possible sensitivity, **LNA** can be turned on *together* with "Internal Preamp" on page 2183, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see "More Information" on page 382

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?`
Example	`:POW:GAIN:LNA ON`
Dependencies	Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9420A/10A/11A M9410E/11E/15E/16E support LNA May not appear in some measurements **LNA** is not available when the electronic/soft attenuator is enabled
Preset	`OFF`
State Saved	Saved in State

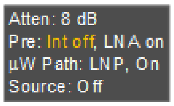
More Information

When **LNA** is installed, the preamp annotation changes to show the state of both **LNA** and **Internal Preamp**. Below is an example:



Atten: 8 dB
Pre: Int on, LNA on
µW Path: LNP, On
Source: Off

Note that when operating entirely in the low band (below about 3.6 GHz), if **LNA** is on, **Internal Preamp** is switched off (even if you have its switch set to ON). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:



Atten: 8 dB
Pre: Int off, LNA on
µW Path: LNP, On
Source: Off

µW Path Control

Options for this control include **µW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the µW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **µW Preselector Bypas**s, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the µW Preselector’s bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21-26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp’s compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **µW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. µW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See "Low Noise Path Enable" on page 387
µW Preselector Bypass	:POW:MW:PATH MPB	See "µW Preselector Bypass" on page 389
Full Bypass Enable	:POW:MW:PATH FULL	See "Full Bypass Enable" on page 390

<table>
<tr><td>Remote Command</td><td><code>[:SENSe]:POWer[:RF]:MW:PATH STD | LNPath | MPBypass | FULL</code>
<code>[:SENSe]:POWer[:RF]:MW:PATH?</code></td></tr>
<tr><td>Example</td><td><code>:POW:MW:PATH LNP</code>
Enables the Low Noise path
<code>:POW:MW:PATH?</code></td></tr>
<tr><td>Notes</td><td>When "Presel Center" on page 2181 is performed, the instrument momentarily switches to the Standard Path, regardless of the setting of µW Path Control
The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean “when the low noise path is enabled” but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is Low Noise Path Enable or Full Bypass Enable. In the case where the DC Block is switched in, the instrument is now AC-coupled. However, if you selected DC coupling, the UI would still behave as though it were DC-coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC-coupled
Alignment switching ignores the settings in this menu, and restores them when finished</td></tr>
<tr><td>Dependencies</td><td>Does not appear in CXA-m, VXT Models M9410A/11A/15A/16A, nor in M9410E/11E/15E/16E, BBIQ and External Mixing
– The Low Noise Path Enable selection does not appear unless Option LNP is present and licensed
– The µW Preselector Bypass selection does not appear unless Option MPB is present and licensed
– The Full Bypass Enable selection does not appear unless options LNP and MPB are both present as well as option FBP
In any of these cases, if the required options are not present and the SCPI command is sent, error -241, "Hardware missing; Option not installed" is generated
Low Noise Path Enable and Full Bypass Enable are grayed-out if the current measurement does not support them
Low Noise Path Enable and Full Bypass Enable are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, “Setting Conflict; Feature not supported for this measurement”</td></tr>

Annotation	In the Meas Bar, if the Standard path is chosen: µW Path: Standard If Low Noise Path is enabled but the LNP switch is not thrown: µW Path: LNP,Off If the Low Noise Path is enabled and the LNP switch *is* thrown: µW Path: LNP,On If the preselector is bypassed: µW Path: Bypass If Full Bypass Enable is selected but the LNP switch is not thrown: µW Path: FByp,Off If Full Bypass Enable is selected and the LNP switch *is* thrown: µW Path: FByp,On

µW Path Control Auto

In VMA, WLAN, 5G NR, CQM Modes, an **Auto/Man** switch is added to **µW Path Control**:

This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

Measurement	µW Path Control Auto behavior
Digital Demod	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Custom OFDM	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Measurement	µW Path Control Auto behavior
ACP	Always Presel Bypass
SEM	Always Presel Bypass
Spurious Emissions	Always Standard Path

WLAN Mode

Measurement	µW Path Control Auto behavior
Modulation Analysis	Always Presel Bypass
Spectral Flatness	Always Presel Bypasss
Power vs Time	Always Presel Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Always Presel Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Always Presel Bypass
SEM	For 11be 320M, when ‘Enabled Wideband IF for FFT’ is OFF or ‘Sweep Type Rule’ is Best Dynamic Range, auto µW path is standard For other cases, auto µW path is presel bypass if presel bypass is enabled, auto µW path is standard if presel bypass is not enabled
Spurious Emissions	Always Standard Path

5G NR Mode

Measurement	µW Path Control Auto behavior
Modulation Analysis	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Channel Power	Always Standard Path
Occupied BW	Always Standard Path
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Standard Path
SEM	Always Standard Path
Spurious	Always Standard Path

Measurement	µW Path Control Auto behavior
Emissions	
Transmit On|Off Power	Use Standard Path unless tuned frequency > 3.6 GHz and Info BW > 15 MHz, in which case choose Preselector Bypass

Channel Quality Mode

Measurement	µW Path Control Auto behavior
Group Delay	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Remote Command	`[:SENSe]:POWer[:RF]:MW:PATH:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:MW:PATH:AUTO?`
Example	`:POW:MW:PATH:AUTO ON` `:POW:MW:PATH:AUTO?`
Dependencies	Only appears in VMA, WLAN, 5G NR and CQM Modes
Couplings	See "µW Path Control Auto" on page 385 above
Preset	ON
Range	ON|OFF

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used,

whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

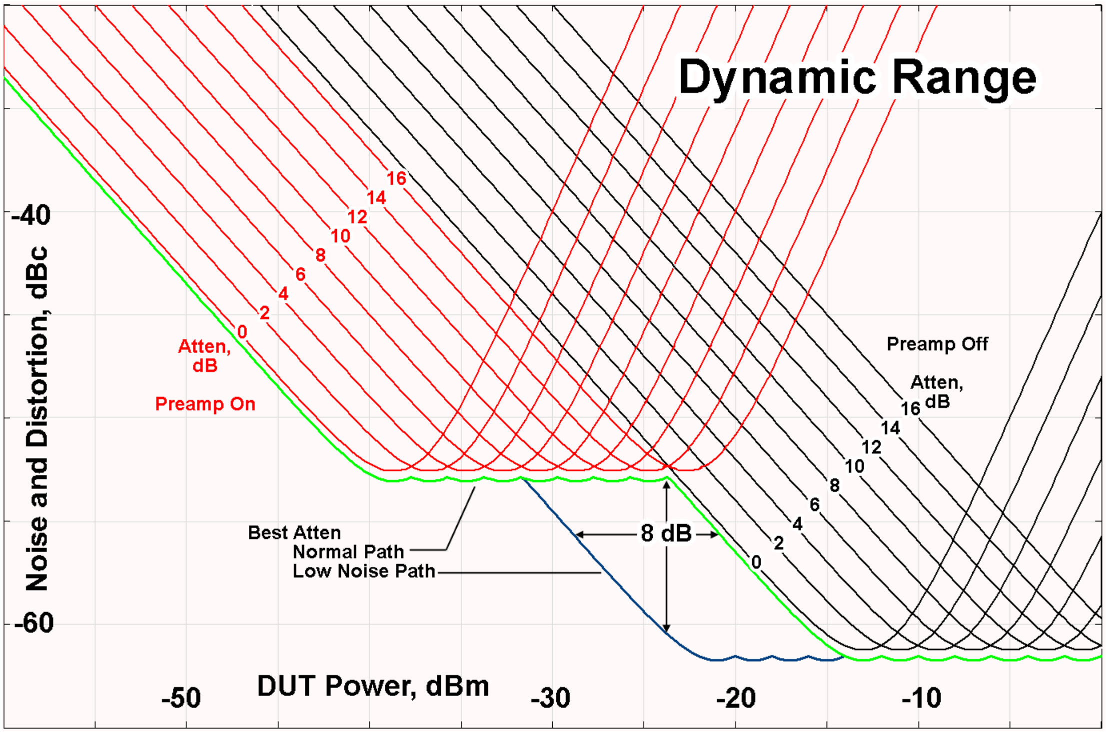
Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.



There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

µW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave presel is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and "Y Scale" on page 2153 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently,

whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

Microwave Preselector Bypass Backwards Compatibility

Example	Bypass the microwave preselector: `:POW:MW:PRES OFF`
Notes	Included for Microwave Preselector Bypass backwards compatibility The `ON` parameter sets the `STD` path (`:POW:MW:PATH STD`) The `OFF` parameter sets path `MPB` (`:POW:MW:PATH MPB`)
Preset	`ON`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON | OFF | 0 | 1` `[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?`

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender's preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is `OFF`, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

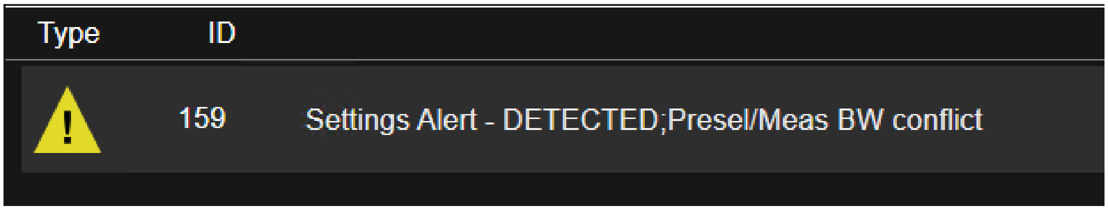
An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert;Presel/Meas BW conflict

Settings Alert message in the error queue

.



159 Settings Alert - DETECTED;Presel/Meas BW conflict

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A/15A/16A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

– There is some speed cost due to the need to take multiple captures

– Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection `ON` at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:STATe 0 | 1 | ON | OFF` `[:SENSe]:POWer[:RF]:SWPresel:STAT?`
Example	`:POW:SWPR:STAT 1` `:POW:SWPR:STAT?`
Dependencies	Only appears in N9041B, N9042B+V2050A, VXT models M9410A/11A and M9410E/11E. Does not appear in all measurements
Couplings	Affects **Sweep Time** **Auto Tune** supports **Software Preselection**, so **Auto Tune** should be performed after setting the **Software Preselection** state
Preset	N9041B: `OFF` N9042B+V3050A: `ON` M9410A/11A: `ON`
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by 2 * IF / N. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- `NORMal` - mathematically removes all image and multiple responses of signals present at the input
- `ADVanced` - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel NORMal | ADVanced` `[:SENSe]:POWer[:RF]:SWPResel?`
Example	`:POW:SWPR NORM` `:POW:SWPR?`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 2195 is `OFF`. The grayout message is “Unavailable unless SW Presel enabled”
Preset	N9041B: `ADVanced` N9042B+V3050A: `NORMal`
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- `NORMal` – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for `NARRow` (below)
- `NARRow`– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from

wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:BW NORMal | NARRow` `[:SENSe]:POWer[:RF]:SWPResel:BW?`
Example	`:POW:SWPR:BW NARR`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 2195 is `OFF`. The grayout message is “Unavailable unless SW Presel enabled” For N9042B+V3050A, the parameter is SCPI-only, and always set to `NARRow` when **Software Preselection** is enabled
Preset	N9041B: `NORMal` N9042B+V3050A: `NARRow`
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A and M9410E/11E in bypass frequency range (1310MHz~5GHz), the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the “Prefilter” bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	`[:SENSe]:<measurement>:PFILter[:STATe] ON | OFF | 1 | 0` `[:SENSe]:<measurement>:PFILter[:STATe]?`

Example	Enable High Freq Prefilter for the Complex Spectrum Measurement in `BASIC` Mode:
	`:SPEC:PFIL ON`
	Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes:
	`:WAV:PFIL ON`
	Enable High Freq Prefilter for the Swept SA Measurement in `SA` Mode:
	`:SAN:PFIL ON`

Dependencies	Only appears in VXT models M9410A/11A with center frequency above 1310 MHz, and M9410E/11E in frequency range 1310MHz~5GHz
Preset	See "Prefilter Presets" on page 396 below

State Saved	Saved in instrument state

Prefilter Presets

Meas	Mode	Preset
SPEC	BASIC	OFF
WAV	BASIC, WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
MON	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
RHO	WCDMA	OFF
CDP	WCDMA	OFF
PCON	WCDMA	OFF
EVMQ	WCDMA	OFF
CHP	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
OBW	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
ACP	WCDMA, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
SEM	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PST	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PVT	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
EVM	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
FLAT	WLAN	OFF
EVMM	WLAN	OFF
CEVM	LTEAFDD, LTEATDD	OFF
PAVT	5GNR, VMA	OFF
DDEM	VMA	OFF
OFDM	VMA	OFF
SAN	SA	ON
HARM	SA	ON

3.3.4 BW

Opens the Bandwidth (BW) menu, which contains controls for "Res BW" on page 397 and "Video BW" on page 398.

The **Resolution BW** functions control filter bandwidth and filter type. There are two filter types, Gaussian and Flattop. The Gaussian filters have a response curve that is parabolic on a log scale. The Flattop filter shape is a close approximation of a rectangular filter.

3.3.4.1 Settings

Contains the basic bandwidth functions. In this measurement, it is the only tab under BW.

Res BW

Activates the resolution bandwidth active function, which allows you to manually set the resolution bandwidth (RBW) of the instrument.

Normally, **Res BW** (Auto) selects automatic coupling of the **Res BW** to "Span" on page 410 using the ratio set by **Span:3 dB RBW** (some measurements do not have a **Span:3 dB RBW** control, in which case the measurement chooses the optimal ratio). To decouple the resolution bandwidth, press the **Auto/Man** toggle on the **Res BW** control, or simply enter a different value for **Res BW**.

When the **Res BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on the **Res BW** control. This may also be done by pressing "Auto Couple" on page 2242 or by performing a **Preset**.

When **Res BW** is set to **Auto**, the bandwidth selected depends on "RBW Filter Type" on page 399.

Only certain discrete resolution bandwidths are available. The available bandwidths are dependent on **Filter Type** or **EMC Standard**. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

Remote Command	`[:SENSe]:OBWidth:BANDwidth[:RESolution] <bandwidth>`
	`[:SENSe]:OBWidth:BANDwidth[:RESolution]?`
	`[:SENSe]:OBWidth:BANDwidth[:RESolution]:AUTO ON | OFF | 1 | 0`
	`[:SENSe]:OBWidth:BANDwidth[:RESolution]:AUTO?`

Example	`:OBW:BAND 5 MHz`
	`:OBW:BAND?`
	`:OBW:BAND:AUTO ON`
	`:OBW:BAND:AUTO?`

Notes	For numeric entries, all RBW Types choose the nearest (arithmetically, on a linear scale, rounding up) available RBW to the value entered The setting and querying of values depend on the current bandwidth type
Couplings	Sweep time is coupled to RBW. As RBW changes, the sweep time (if set to **Auto**) is changed to maintain amplitude calibration "Video BW" on page 398 is coupled to RBW. As the resolution bandwidth changes, the video bandwidth (if set to **Auto**) changes to maintain the ratio of VBW/RBW (10:1) When **Res BW** is set to **Auto**, the resolution bandwidth is auto-coupled to the span. The ratio of Span/RBW is approximately 106:1 when auto coupled. When **Res BW** is set to **Man**, and the bandwidths are entered manually, these bandwidths are used regardless of other instrument settings
Preset	**Auto**, unless noted in "RBW Presets" on page 398 below See table below
State Saved	Saved in instrument state

Min	1 Hz
Max	8 MHz is the max equivalent –3 dB RBW, which means that the named RBW (the one shown on the control etc.) can exceed 8 MHz if using a filter other than –3 dB Gaussian
Annotation	A "#" mark appears before "RBW" in the annotation when it is switched from Auto to Manual coupling
Backwards Compatibility Notes	For backwards compatibility, this command supports both `BANDwidth` and `BWIDth` forms For ESA, the maximum Res BW was 5 MHz; for X-Series it is 8 MHz

RBW Presets

Unless noted in the table below, the Preset value of RBW is **Auto**.

Mode	Preset Value
WCDMA	30 kHz
BT	10 kHz
WLAN	100 kHz
MSR	30 kHz
LTE, LTETDD, LTEAFDD, LTEATDD, 5G NR	30 kHz

Video BW

Lets you change the instrument post-detection filter (VBW or "video bandwidth") from 1 Hz to 8 MHz, in approximately 10% steps. In addition, a wide-open video filter bandwidth may be chosen by selecting 50 MHz. The VBW is annotated at the bottom of the display, in the center.

Video BW (Auto) selects automatic coupling of **Video BW** to "Res BW" on page 397. To decouple the resolution bandwidth, press the **Auto/Man** toggle on the **Video BW** control, or simply enter a different value for **Video BW**.

When **Video BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on **Video BW**. This may also be done by pressing "Auto Couple" on page 2242 or by performing a **Preset**.

Remote Command

```
[:SENSe]:OBWidth:BANDwidth:VIDeo <bandwidth>
[:SENSe]:OBWidth:BANDwidth:VIDeo?
[:SENSe]:OBWidth:BANDwidth:VIDeo:AUTO ON | OFF | 1 | 0
[:SENSe]:OBWidth:BANDwidth:VIDeo:AUTO?
```

Example

```
:OBW:BAND:VID 2.4 MHz
:OBW:BAND:VID?
:OBW:BAND:VID:AUTO ON
:OBW:BAND:VID:AUTO?
```

Notes	For numeric entries, the instrument chooses the nearest (arithmetically, on a linear scale, rounding up) available VBW to the value entered. The 50 MHz VBW is defined to mean “wide open” The values shown in this table reflect the conditions after a Mode Preset
Dependencies	Sometimes the displayed **Video BW** is not actually used to process the trace data: When the **Average** detector is selected, and **Sweep Type** is set to **Swept**, the video bandwidth filter cannot be used, because it uses the same hardware as the **Average** detector When the **Quasi-Peak**, **EMI Average**, or **RMS Average** detector is selected, **Video BW** is implemented by the digital IF as part of the detector In this case, **Video BW** still acts to change the Sweep Time, if Sweep Time is in **Auto**, and still affects the data on other traces for which this is not the case
Couplings	Normally coupled to **Res BW**. If **Video BW** is set to **Auto**, then video bandwidth is changed as **Res BW** changes, to maintain the preset ratio (normally 10:1)
Preset	**Auto**, unless noted in "Video BW Presets" on page 399 below ON
State Saved	Saved in instrument state
Min	1 Hz
Max	50 MHz
Annunciation	A “#” mark appears before “VBW” in the annotation when it is not coupled
Annotation	In the bottom center of the screen, “VBW <value> <units>” indicates the current video bandwidth value. Note that for some detectors this is not the value used for VBW (see above)
Backwards Compatibility Notes	For backwards compatibility, this command supports both `BANDwidth` and `BWIDth` forms

Video BW Presets

Unless noted in the table below, the Preset value is **Auto**.

Mode ID	Preset Value
WCDMA	300 kHz
BT	30 kHz

RBW Filter Type

Selects the type for the resolution bandwidth filters. Historically, the **Res BW** filters in HP/Agilent/Keysight spectrum analyzers were Gaussian filters, specified using the –3 dB bandwidth of the filter. That is, a 10 MHz **Res BW** filter was a Gaussian shape with its –3 dB points 10 MHz apart. In X-Series, you can choose between a Gaussian and Flat Top filter shape, for varying measurement conditions.

Filter Type	SCPI
Gaussian	GAUSsian
Flattop	FLATtop

Remote Command	`[:SENSe]:OBWidth:BANDwidth:SHAPe GAUSsian | FLATtop` `[:SENSe]:OBWidth:BANDwidth:SHAPe?`
Example	`:OBW:BAND:SHAP GAUS` `:OBW:BAND:SHAP?`
Preset	"Auto Couple" on page 2242 selects the preset value
State Saved	Saved in instrument state
Annotation	The annotation under RBW in the bottom left of the screen shows the type of filter or bandwidth that is being used. The following examples illustrate this:

–3 dB (Normal) filter BW	Res BW 300 Hz
–6 dB filter BW	Res BW (–6 dB) 422 Hz
Noise filter BW	Res BW (Noise) 317 Hz
Impulse filter BW	Res BW (Impulse) 444 Hz
CISPR filter BW	Res BW (CISPR) 200 Hz
MIL filter BW	Res BW (MIL) 1 kHz
Flattop filter type	Res BW (Flattop) 300 Hz

Backwards Compatibility SCPI	`[:SENSe]:OBWidth:BWIDth:SHAPe`

3.3.5 Display

Opens the **Display** menu, which lets you configure display items for the current Mode, Measurement View or Window.

3.3.5.1 Meas Display

Contains controls for setting the display for the current Measurement, View or Window.

x dB BW Boundaries On/Off

Turns the x dB BW Boundaries On or Off.

Remote Command	`:DISPlay:OBWidth:WINDow[1]:XDB 0 | 1 | OFF | ON` `:DISPlay:OBWidth:WINDow[1]:XDB?`

Example	`:DISP:OBW:WIND:XDB 1` `:DISP:OBW:WIND:XDB?`
Preset	0
State Saved	Saved in instrument state
Range	`OFF|ON`
Backwards Compatibility SCPI	`:DISPlay:OBWidth:VIEW:WINDow[1]:XDB`

Boundary Frequency

Selects frequency display type:

- `OFFSet`: offsets from Center Freq to OBW boundary frequency are displayed
- `ABSolute`: absolute frequencies are displayed

Remote Command	`:DISPlay:OBWidth:WINDow2:BOUNdaries:FREQuency OFFSet | ABSolute` `:DISPlay:OBWidth:WINDow2:BOUNdaries:FREQuency?`
Example	`:DISP:OBW:WIND2:BOUN:FREQ ABS` `:DISP:OBW:WIND2:BOUN:FREQ?`
Preset	`OFFSet`
State Saved	Saved in instrument state
Range	`OFFSet|ABSolute`
Backwards Compatibility SCPI	`:DISPlay:OBWidth:VIEW2:WINDow2:BOUNdaries:FREQuency`

3.3.5.2 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	`:DISPlay:GRATicule[:STATe] OFF | ON | 0 | 1` `:DISPlay:GRATicule[:STATe]?`
Example	`:DISP:GRAT OFF`

Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	`ON`
State Saved	Saved in instrument state

Backwards Compatibility SCPI	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF | ON | 0 | 1`
	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?`
	This command is accepted for backwards compatibility with older instruments, but the `WINDow`, `TRACe` and `GRID` parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When `OFF`, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	`:DISPlay:ANNotation:SCReen[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:SCReen[:STATe]?`
Example	`:DISP:ANN:SCR OFF`
Dependencies	Grayed-out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with ....

Remote Command	`:DISPlay:ANNotation:TRACe[:STATe] ON | OFF | 1 | 0`

	`:DISPlay:ANNotation:TRACe[:STATe]?`
Example	`:DISP:ANN:TRAC OFF`
Preset	`OFF`
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	`:DISPlay:ACTivefunc[:STATe] ON | OFF | 1 | 0` `:DISPlay:ACTivefunc[:STATe]?`
Example	`:DISP:ACT OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	`:DISPlay:ANNotation:MBAR[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:MBAR[:STATe]?`
Example	`:DISP:ANN:MBAR OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. Theare three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor :SYSTem:PRESet enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are using either the `:SYSTem:KLOCk` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is `OFF`, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages "-221, Settings conflict; Screen SCPI cannot be used when Display is disabled" or "221, Settings conflict; View SCPI cannot be used while Display is disabled". These commands include:

Name	Command
Select User View	`:DISPlay:VIEW:ADVanced:SELect`
Rename User View	`:DISPlay:VIEW:ADVanced:REName`
Delete User View	`:DISPlay:VIEW:ADVanced:DELete`
Create User View	`:DISPlay:VIEW:ADVanced:NAME`
Select Screen	`:INSTrument:SCReen:SELect`
Delete Screen	`:INSTrument:SCReen:DELete`
Delete All But This Screen	`:INSTrument:SCReen:DELete:ALL`
Add Screen	`:INSTrument:SCReen:CREate`
Rename Screen	`:INSTrument:SCReen:REName`
Sequencer On/Off	`:SYSTem:SEQuencer`

Remote Command	`:DISPlay:ENABle OFF | ON | 0 | 1` `:DISPlay:ENABle?`
Example	`:DISP:ENAB OFF`
Couplings	`:DISP:ENAB OFF` turns Backlight `OFF` and `:DISP:ENAB ON` turns Backlight `ON`, but changing Backlight settings does *not* change the state of `:DISP:ENAB`
Preset	`ON`

	Set by `:SYST:DEF MISC`, but not affected by `*RST` or `:SYSTem:PRESet`
State Saved	Not saved in instrument state
Backwards Compatibility Notes	`:SYST:PRES` no longer turns on `:DISPlay:ENABle` as it did in legacy analyzers

3.3.5.3 View

Contains controls for selecting the current **View**, and for editing User Views.

View

See "Views" on page 349

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:SELect <alphanumeric>` `:DISPlay:VIEW:ADVanced:SELect?`
Example	Select Baseband as the current View `:DISP:VIEW:ADV:SEL “Baseband”`

Notes	You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command
	For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	because “Trace Zoom” is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu
	You *cannot* use the legacy View parameter (which in this case would be `TZOom`) with `:DISP:VIEW:ADV:SEL`
	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	`:DISP:VIEW:ADV:SEL "TRACE ZOOM"`
	If the specified view is not a valid View, the query returns the error message “-224, Illegal parameter value; View with the name <alphanumeric> does not exist”
	If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated

Backwards Compatibility SCPI	The legacy node `:DISPlay:VIEW[:SELect]` is retained for backwards compatibility, but it only supports predefined views

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a “User View”.

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	`:DISPlay:VIEW:ADVanced:NAME <alphanumeric>`
Example	`:DISP:VIEW:ADV:NAME “Baseband”` Creates a new View named `Baseband` from the current View, and selects it as the current View
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If `<alphanumeric>` name already exists as a View, the error message “-224, Illegal parameter value; View <alphanumeric> already exists” is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; User View SCPI cannot be used while Display is disabled” is generated

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View’s name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	`:DISPlay:VIEW:ADVanced:REName <alphanumeric>`
Example	`:DISP:VIEW:ADV:REN “Baseband”`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` specifying the new name is already present in the list of View names, the error message “-224, Illegal parameter value; View <alphanumeric> already exists” is generated If the current View is a Predefined View, the error message “-224, Illegal parameter value; Cannot rename a Predefined View” is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete`
Example	`:DISP:VIEW:ADV:DEL`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` is not present in the list of View names, the error message “-224, Illegal parameter value; View <alphanumeric> does not exist” is generated If the current View is a Predefined View, the error message “-224, Illegal parameter value; Cannot delete a Predefined View” is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete:ALL`

Example	`:DISP:VIEW:ADV:DEL:ALL`
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SELect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:CATalog?`
Example	`:DISP:VIEW:ADV:CAT?`
Notes	Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for *all* the Views, including User Views, available for the current Measurement Example: `"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"` No distinction is made between Predefined and User Views If you switch measurements with the display disabled (via `:DISP:ENAB OFF`), then query the list of available Views, the result is undefined

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:USER:CATalog?`
Example	`:DISP:VIEW:ADV:USER:CAT?`
Notes	Returns a quoted string of the available User Views for the current measurement, separated by commas. Example: `"Baseband,myView1,yourView1"` If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 2211), then query the list of available Views, the result is undefined

3.3.6 Frequency

Opens the **Frequency** menu, which contains controls that allow you to control the Frequency and Channel parameters of the instrument.

Some features in the **Frequency** menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset. For example, the Center Freq setting is the same for all measurements - it does not change as you change measurements.

3.3.6.1 Settings

Contains controls that pertain to the X-Axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Carrier Reference Frequency

Sets **Carrier Reference Frequency**. The center frequencies of carriers are defined as offset frequency from this value. This reference frequency is also the reference of carrier configuration preset.

Because LTE-A, MSR and 5G NR measurements often deal with multiple carriers with distinct bandwidths, the simple Center Frequency parameter used in most measurements does not apply here. Instead, the Carrier Reference Frequency is the key parameter. This must be distinct from the Center Frequency parameter used in other measurements, as Center Frequency can be a global parameter, and it would not make sense for Carrier Reference Frequency to take on this global value.

In LTE-A and 5G NR Modes, if the following conditions are satisfied at the same time:

- the Number of Component Carriers is 1
- the Center Freq Offset is 0 Hz
- the mode of the Center Freq is Auto

then Center Freq is equivalent to Carrier Ref Freq. When Center Freq changes in such conditions, the mode of Center Freq remains as Auto and Carrier Ref Freq will be changed to same value. The major purpose of this coupling is to keep BWCC with legacy LTE/LTE TDD, in which `:SENSe:FREQuency:CENTer` is used to set up the frequency of the measurement.

See "More Information" on page 410.

Remote Command	For LTE-A, 5G NR
	`[:SENSe]:CCARrier:REFerence <freq>`
	`[:SENSe]:CCARrier:REFerence?`
	For MSR
	`[:SENSe]:CARRier:REFerence <freq>`
	`[:SENSe]:CARRier:REFerence?`

Example	For LTE-A, 5G NR
	`:CCAR:REF 2GHz`
	`:CCAR:REF?`
	For MSR
	`:CARR:REF 2GHz`
	`:CARR:REF?`

Dependencies	Only available in LTEAFDD/LTEATDD, 5GNR and MSR Modes
Preset	1GHz
State Saved	Saved in instrument state
Min/Max	Depends on instrument minimum center frequency. Same as **Center Frequency**

More Information

In most applications, **Center Frequency** is generally where the carrier center is located at and thus plays a very important role. However, in LTE-Advanced TDD/FDD mode, the measurements are done based on carrier center frequencies and its bandwidths, both of which are calculated or obtained according to the carriers’ configuration.

Carrier center frequencies are defined using offsets from **Carrier Reference Frequency**, which determine absolute frequency locations, which can be set as both absolute and relative frequency from the carrier reference frequency.

Span

Set the frequency of the occupied bandwidth span for the current measurement.

Remote Command	`[:SENSe]:OBWidth:FREQuency:SPAN <freq>`
	`[:SENSe]:OBWidth:FREQuency:SPAN?`
	`[:SENSe]:OBWidth:FREQuency:SPAN:AUTO ON | OFF | 0 | 1`
	`[:SENSe]:OBWidth:FREQuency:SPAN:AUTO?`

Example	`:OBW:FREQ:SPAN 2.4 MHz` `:OBW:FREQ:SPAN?`

	`:OBW:FREQ:SPAN:AUTO 0` `:OBW:FREQ:SPAN:AUTO?`
Notes	Span Auto Detector (`[:SENSe]:OBWidth:FREQuency:SPAN:AUTO`) is only available in the MSR, LTEAFDD/LTEATDD and 5GNR modes
Dependencies	The Auto Detect functionality is only available in the MSR, LTEAFDD/LTEATDD and 5GNR modes
Preset	

Mode	Value
`SA`	3 MHz
`WCDMA`	10 MHz
`LTEAFDD, LTEATDD`	10 MHz
`BT`	2 MHz
`5GNR`	Automatically calculated
`RTS`	27 kHz
`MSR`	10 MHz
`WLAN`	

Radio Std	Value
802.11b	30MHz
802.11a/g/n/ac/ax/be (20MHz)	25 MHz
802.11n/ac/ax/be (40MHz)	50 MHz
802.11n/ac/ax/be (80MHz)	100 MHz
802.11ac/ax/be (160MHz)	200 MHz
802.11be (320MHz)	400 MHz

State Saved	Yes
Min	100 Hz
Max	Hardware Maximum Span
Backwards Compatibility SCPI	`[:SENSe]:EBWidth:FREQuency:SPAN`

Full Span (Remote Command Only)

Changes the Occupied Bandwidth Span to show the full frequency range of the instrument. It maximizes the span within a range but does not change **Center Frequency**. When using external mixing, it changes the displayed frequency span to the frequency range specified for the selected external mixing band.

Remote Command	`[:SENSe]:OBWidth:FREQuency:SPAN:FULL`

Example	`:OBW:FREQ:SPAN:FULL`
Couplings	Selecting full span changes the measurement span value

3.3.7 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, **Marker** selects marker 1, sets it to **Normal** mode (see "Marker Mode" on page 414), and places it at the center of the display. If the selected marker is **Off**, it is set to **Normal** and placed at the center of the screen, on the trace determined by the Marker Trace rules.

3.3.7.1 Select Marker

Specifies the selected marker. The term “selected marker” is used throughout this document to specify which marker will be affected when you change marker settings, perform a **Peak Search**, etc.

This control appears above the menu panel, indicating that it applies to all controls in the **Marker** menu panels. **Select Marker** is blanked if you select a tab whose controls do *not* depend on the selected marker (for example, **Counter**).

For any menu that includes **Select Marker**, the first control is always **Marker Frequency | Time**.

Notes	The selected marker is remembered even when not in the **Marker** menu and is used if a search is done, or a Band Function is turned on, or for Signal Track or Continuous Peak
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for **Normal** and **Delta** markers

3.3.7.2 Settings

The controls on this tab include the Marker active function and a radio button selection for the marker control mode (**Normal**/`POSition`, **Delta** or **Off**; see "Marker Mode" on page 414) for the selected marker, as well as additional functions that help you use markers.

Marker Frequency

Sets the marker X-Axis value in the current marker X-Axis Scale unit. It has no effect if the control mode (see "Marker Mode" on page 414) is **Off,** but is the SCPI equivalent of entering an X value if the control mode is **Normal** or **Delta**.

Remote Command	`:CALCulate:OBWidth:MARKer[1]|2|…|12:X <freq>` `:CALCulate:OBWidth:MARKer[1]|2|…|12:X?`
Example	`:CALC:OBW:MARK3:X 0` `:CALC:OBW:MARK3:X?`
Notes	If no suffix is sent, uses the fundamental units for the current marker X Axis Scale. If a suffix is sent that does not match the current marker X Axis Scale unit, an error “Invalid suffix” is generated The query returns the marker’s absolute X Axis value if the control mode is **Normal**, or the offset from the marker’s reference marker if the control mode is **Delta**. The query is returned in the fundamental units for the current marker X Axis scale: Hz for **Frequency** and **Inverse Time**, seconds for **Period** and **Time**
Preset	After a preset, all markers are turned `OFF`, so Marker X Axis Value query returns Not a Number (NAN)
State Saved	Saved in instrument state
Min	-9.9E+37
Max	9.9E+37
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Marker X Axis Position (Remote Command Only)

Sets the marker X-Axis Scale position in trace points. This setting has no effect if the control mode is **Off**, but is the SCPI equivalent of entering a value if the control mode is **Normal** or **Delta** - except in trace points rather than X-Axis Scale units. The entered value is immediately translated into the current X-Axis Scale units for setting the value of the marker.

Remote Command	`:CALCulate:OBWidth:MARKer[1]|2|…|12:X:POSition <real>` `:CALCulate:OBWidth:MARKer[1]|2|…|12:X:POSition?`
Example	`:CALC:OBW:MARK10:X:POS 0` `:CALC:OBW:MARK10:X:POS?`
Notes	The query returns the marker’s absolute X-Axis value in trace points if the control mode is **Normal**, or the offset from the marker’s reference marker in trace points if the control mode is **Delta**. The value is returned as a real number, not an integer, corresponding to the translation from X-Axis Scale units to trace points . When a marker is turned on, it is placed center of the screen on the trace. Therefore, the default value depends on instrument condition If the marker is **Off**, the query response is Not A Number
Preset	After a preset, all markers are turned **Off**, so the query returns Not A Number (NAN)
State Saved	Saved in instrument state
Min	-9.9E+37
Max	9.9E+37

Marker Y Axis Value (Remote Query only)

Returns the marker Y-Axis value in the current marker Y-Axis unit.

Remote Command	`:CALCulate:OBWidth:MARKer[1]|2|…|12:Y?`
Example	`:CALC:OBW:MARK11:Y?`
Notes	Returns the marker Y-Axis result, if the control mode is **Normal** or **Delta** If the marker is **Off**, the response is Not A Number
Preset	Result dependent on Markers setup and signal source
State Saved	No
Backwards Compatibility SCPI	`:CALCulate:OBWidth:MARKer[1]|2|…|12:FUNCtion:RESult?`

Marker Mode

Sets the marker control mode to **Normal** (`POSition`), **Delta**, or **Off**. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is `OFF`, pressing **Marker** sets it to **Normal** and places it at the center of the screen on the trace determined by the **Marker Trace** rules. At the same time, **Marker X Axis Value** appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is **Off**, there is no active function, and the active function is turned off.

Remote Command	`:CALCulate:OBWidth:MARKer[1]|2|…|12:MODE POSition | DELTa | OFF` `:CALCulate:OBWidth:MARKer[1]|2|…|12:MODE?`
Example	`:CALC:OBW:MARK:MODE POS` `:CALC:OBW:MARK:MODE?`
Preset	`OFF`
State Saved	Saved in instrument state
Range	`POSition|DELTa|OFF`
Annotation	Mkr # <X value> and <Marker value> upper right on graph When Marker Trace is Polar in WCDMA mode: Mkr # <Chip Value (RHO & QPSKEVM)/Symbol Value (CDP)>, <X value> and <Y value> upper right on graph

Backwards Compatibility SCPI Command

Sets or queries the state of a marker. Setting a marker that is `OFF` to `ON` (1), puts it in **Normal** mode, and places it at the center of the screen.

Example	`:CALC:OBW:MARK3:STAT ON` `:CALC:OBW:MARK3:STAT?`
Preset	`OFF`
State Saved	Saved in instrument state
Range	`OFF|ON`
Backwards Compatibility SCPI	`:CALCulate:OBWidth:MARKer[1]|2|…|12:STATe OFF | ON | 0 | 1` `:CALCulate:OBWidth:MARKer[1]|2|…|12:STATe?`

Delta Marker (Reset Delta)

Pressing this button has the same effect as pressing **Delta** in **Marker Mode**. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the delta to zero.

Marker Settings Diagram

Lets you configure the **Marker** system using a visual utility.

All Markers Off

Turns off all markers.

Remote Command	`:CALCulate:OBWidth:MARKer:AOFF`
Example	`:CALC:OBW:MARK:AOFF`

3.3.7.3 Peak Search

The controls on this tab allow you to move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with "Marker Delta" on page 416.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a peak search.

Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a peak search.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as "Marker Frequency" on page 412 on the **Settings** tab.

Peak Search

Moves the selected marker to the trace point which has the maximum y-axis value for that marker’s trace.

NOTE **Pressing the Peak Search hardkey automatically moves you to the Peak Search page of the Marker menu *and* performs a peak search.**

Remote Command	`:CALCulate:OBWidth:MARKer[1]|2|…|12:MAXimum`

Example	`:CALC:OBW:MARK2:MAX`
	`:SYST:ERR?`
	can be used to query the errors to determine if a peak is found. The message “No peak found” (-200) will be returned after an unsuccessful search

Notes	Sending this command selects the subopcoded marker In WCDMA Mode, this command does not work when the selected marker is located on the polar trace. In this case, the command is ignored

Marker Delta

Pressing this button has the same effect as pressing **Delta** in "Marker Mode" on page 414 on the **Settings** tab. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the delta to zero.

The control is duplicated here to allow you to conveniently perform a peak search and change the marker’s control mode to **Delta** without having to access two separate menus.

3.3.7.4 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as "Marker Frequency" on page 412 on the **Settings** tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the "reference marker" for that marker. This attribute is set by the **Marker, Properties, Relative To** key. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	`:CALCulate:OBWidth:MARKer[1]|2|…|12:REFerence <integer>` `:CALCulate:OBWidth:MARKer[1]|2|…|12:REFerence?`
Example	`:CALC:OBW:MARK:REF 2` `:CALC:OBW:MARK:REF?`
Notes	Causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded, the value is clipped A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: "Settings conflict; marker cannot be relative to itself" The query returns a single value (the specified marker number's relative marker)
Couplings	The act of specifying the selected marker's reference marker makes the selected marker a **Delta** marker If the reference marker is **Off**, it is turned on in **Normal** mode at the **Delta** marker location
Preset	The preset default "Relative To" marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then it's default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by using **Restore Mode Defaults.** This is not reset by **Marker Off**, **All Markers Off**, or **Preset**
State Saved	Saved in instrument state. Not affected by **Marker Off** and hence not affected by **Preset** or power cycle
Min	1
Max	12
Annunciation	Appears in the marker label of a **Delta** marker

Marker Trace

Selects the trace on which you want your marker placed. A marker is associated with one and only one trace. This trace is used to determine the placement, result, and X-

Axis Scale of the marker. All markers have an associated trace; it is from that trace that they determine their attributes and behaviors, and it is to that trace that they go when they become **Normal** or **Delta** markers (see "Marker Mode" on page 414).

Specifying a **Marker Trace** manually or with this command associates the marker with the specified trace. If the marker is not **Off**, it moves from the trace it was on to the new trace. If the marker is **Off**, it stays off, but is now associated with the specified trace.

The query returns the number of the trace on which the marker is currently placed.

Remote Command	`:CALCulate:OBWidth:MARKer[1]|2|…|12:TRACe 1 | 2 | 3` `:CALCulate:OBWidth:MARKer[1]|2|…|12:TRACe?`
Example	`:CALC:OBW:MARK2:TRAC 2` `:CALC:OBW:MARK2:TRAC?`
Notes	A marker may be placed on a blanked and/or inactive trace, even though the trace is not visible and/or updating An application may register a trace name to be displayed on the control instead of a trace number
Couplings	The state of **Marker Trace** is not affected by "Auto Couple" on page 2242 Sending the remote command causes the addressed marker to become selected
Preset	1
State Saved	Saved in instrument state

Marker Settings Diagram

Lets you configure the **Marker** system using a visual utility. It is the same as "Marker Settings Diagram" on page 415 on the **Settings** tab.

3.3.8 Meas Setup

Contains functions for setting up the measurement parameters and contains functions for setting up parameters global to all measurements in the mode.

3.3.8.1 Settings

Contains frequently used **Meas Setup** functions to which you will want the fastest access.

Avg/Hold Num

Specifies the number of measurement averages used when calculating the measurement result. The average is displayed at the end of each sweep.

Initiates an averaging routine that averages the sweep points in several successive sweeps, resulting in trace smoothing.

After the specified number of average counts, "Average Mode" on page 419 (termination control) determines the average action.

Remote Command	`[:SENSe]:OBWidth:AVERage:COUNt <integer>` `[:SENSe]:OBWidth:AVERage:COUNt?`
Example	`:OBW:AVER:COUN 1500` `:OBW:AVER:COUN?`
Preset	10
State Saved	Yes
Min/Max	1/10000
Annotation	The average count is displayed in the measurement bar on the front panel display. The annotation appears in the format n/N where n is the current average and N is the average count
Backwards Compatibility SCPI	`[:SENSe]:EBWidth:AVERage:COUNt`

Averaging On/Off

Turns averaging on or off.

NOTE In this measurement, **Average Type** is always preset to the `Log-Pwr Avg (Video)` method. Other averaging methods are not available.

Remote Command	`[:SENSe]:OBWidth:AVERage[:STATe] ON | OFF | 1 | 0` `[:SENSe]:OBWidth:AVERage[:STATe]?`
Example	`:OBW:AVER ON` `:OBW:AVER?`
Couplings	**Averaging** state is coupled to "Max Hold (Remote Command Only)" on page 425. If **Max Hold** is changed from OFF to ON, **Averaging** state is automatically set to ON
Preset	ON
State Saved	Yes
Range	ON|OFF
Backwards Compatibility SCPI	`[:SENSe]:EBWidth:AVERage[:STATe]`

Average Mode

Lets you set the averaging mode.

`EXPonential`	Measurement averaging continues using the specified number of averages to compute each averaged value. The average is displayed at the end of each sweep
`REPeat`	The measurement resets the average counter each time the specified number of averages is reached

Remote Command	`[:SENSe]:OBWidth:AVERage:TCONtrol EXPonential | REPeat` `[:SENSe]:OBWidth:AVERage:TCONtrol?`
Example	`:OBW:AVER:TCON REP` `:OBW:AVER:TCON?`
Preset	`EXP`
State Saved	Yes
Range	`EXPonential|REPeat`

% of OBW Power

Assigns the percentage of the total power that is measured within the Occupied Bandwidth for the current measurement. The resulting Occupied Bandwidth limits are displayed by markers placed on the frequencies of the specified percentage.

Remote Command	`[:SENSe]:OBWidth:PERCent <real>` `[:SENSe]:OBWidth:PERCent?`
Example	`:OBW:PERC 75` `:OBW:PERC?`
Preset	99.00
State Saved	Yes
Min/Max	10/99.99

Power Ref

Lets you select Power Ref type:

Total Power	`TPOWer`	Total power in the current span is displayed
OBW Power	`OBWPower`	Occupied power is displayed

When **Power Ref** type is changed, the annotation in the lower window and Remote Command SCPI Results also change.

Remote Command	`[:SENSe]:OBWidth:PREFerence | OBWPower` `[:SENSe]:OBWidth:PREFerence?`
Example	`:OBW:PREF TPOW`

	`:OBW:PREF?`
Preset	`TPOWer`
State Saved	Saved in instrument state
Range	`TPOWer|OBWPower`

x dB

Sets the x dB value used for the "x dB bandwidth" result that measures the bandwidth between two points on the signal that is x dB down from the highest signal point within the OBW Span.

Remote Command	`[:SENSe]:OBWidth:XDB <rel_ampl>` `[:SENSe]:OBWidth:XDB?`
Example	`:OBW:XDB -20` `:OBW:XDB?`
Preset	BT Mode: -20.0 dB All other Modes: -26.0 dB
State Saved	Yes
Min/Max	-100.0 dB/-0.1 dB
Backwards Compatibility SCPI	`[:SENSe]:EBWidth:XDB`

Power Integration Method

Selects the power integration method:

Normal	`NORMal`	By integrating the linear power bucket values from the lower edge of the trace, and interpolating to find the point where the integrated power equals (1 – [Occ BW % Pwr]) / 2 (0.5% if, for example, the 99% occupied bandwidth is to be found) of the total power, frequency f1 is obtained. This procedure is repeated from the upper trace edge to find frequency f2. This calculation uses linear interpolation to find the lower and upper carrier boundary point within the width of a sweep point (the span divided by the number of sweep points), f1 and f2
From Center	`ICENter`	Measures the power spectrum distribution within two times or more frequency range over the requirement for Occupied Bandwidth specification centering on the current carrier frequency

Remote Command	`[:SENSe]:OBWidth:INTegration[:METHod] NORMal | ICENter` `[:SENSe]:OBWidth:INTegration[:METHod]?`
Example	`:OBW:INT NORM`

	`:OBW:INT?`
Preset	For 5GNR Mode, Uplink: `ICENter` All other Modes `NORMal`
State Saved	Yes
Range	`NORMal|ICENter`

Spur Avoidance

Because VXT models M9410A/11A/15A/16A and M9410E/11E/15E/16E are direct-conversion (zero-IF) receivers, feedthrough leakage from the local oscillator appears as a spurious signal (spur) at the center frequency. The **Spur Avoidance** function is provided to eliminate this spur, at the expense of some measurement speed.

When **Spur Avoidance** is enabled (the default), the instrument uses a software algorithm to remove this spur from the displayed measurement data, but the algorithm only operates under certain conditions. Specifically, it only operates in the multiple capture case.

You can disable this function to speed up your measurement by setting **Spur Avoidance** to “Disabled.”

Note that when **Spur Avoidance** is not in effect, either because you have disabled it or because you are not in multiple capture, the following warning message will appear in the status bar:

`Settings Alert;Spur Avoidance Off`

This is to alert you that measurement accuracy might be impacted by the fact that **Spur Avoidance** is not in effect.

The spur avoidance function is not available for:

- M9410A/11A with EP6 option at frequency above 6 GHz
- M9415A/16A at frequency below 380 MHz and above 12.3 GHz
- M9410E/11E/15E/16E at frequency below 380 MHz and above 25.9 GHz

Remote Command	`[:SENSe]:OBWidth:SAVoid[:STATe] OFF | ON | 0 | 1` `[:SENSe]:OBWidth:SAVoid[:STATe]?`
Example	`:OBW:SAV ON` `:OBW:SAV?`
Dependencies	Only appears in VXT models M9410A/11A/15A/16A and M9410E/11E/15E/16E
Preset	`OFF`

State Saved	Saved in instrument state
Range	`OFF|ON`

Meas Setup Summary Table

Lets you view and access many of the parameters in the **Meas Setup** menus on one screen.

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "Measurement-Specific Details" on page 424 below.

Remote Command	`:COUPle ALL`
Example	`:COUP ALL`
Backwards Compatibility SCPI	`:COUPLE ALL | NONE`
Backwards Compatibility Notes	`:COUP:NONE` puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is *not* recommended for making measurements or new designs

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple***does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all measurement parameters to their default values.

Remote Command	`:CONFigure:OBWidth`
Example	`:CONF:OBW`

Max Hold (Remote Command Only)

When `ON`, **Max Hold** displays and holds the maximum responses of the current measurement. Turn **Max Hold**`OFF` to disable the maximum hold feature.

Remote Command	`[:SENSe]:OBWidth:MAXHold ON | OFF | 1 | 0` `[:SENSe]:OBWidth:MAXHold?`
Example	`:OBW:MAXH ON` `:OBW:MAXH?`
Couplings	**Max Hold** is coupled to "Averaging On/Off" on page 419. **Max Hold** is activated only if **Average** state is `ON`. If **Max Hold** is changed to `ON` when **Average** state is `OFF`, **Average** state is automatically set to `ON`
Preset	`OFF`
State Saved	Yes
Range	`OFF|ON`
Backwards Compatibility SCPI	`[:SENSe]:EBWidth:MAXHold`

3.3.8.2 Limits

Lets you set measurement limits and be alerted when they have been exceeded.

Limit Test

Toggles the limit test.

Remote Command	`:CALCulate:OBWidth:LIMit[:TEST] ON | OFF | 1 | 0` `:CALCulate:OBWidth:LIMit[:TEST]?`
Example	`:CALC:OBW:LIM 0` `:CALC:OBW:LIM?`
Dependencies	Only appears in LTEAFDD/LTEATDD and 5GNR Modes
Preset	`ON`

State Saved	Saved in instrument state
Range	`ON`|`OFF`

Bandwidth

Sets the limit bandwidth for OBW measurement.

Remote Command	`:CALCulate:OBWidth:LIMit:FBLimit <freq>` `:CALCulate:OBWidth:LIMit:FBLimit?`
Example	`:CALC:OBW:LIM:FBL 10` `:CALC:OBW:LIM:FBL?`
Dependencies	Only appears in LTEAFDD/LTEATDD and 5GNR Modes
Preset	Automatically calculated
State Saved	Saved in instrument state
Min/Max	1 kHz/Depends on instrument maximum frequency

Remote Command	`:CALCulate:OBWidth:LIMit:FBLimit:AUTO ON | OFF | 1 | 0` `:CALCulate:OBWidth:LIMit:FBLimit:AUTO?`
Example	`:CALC:OBW:LIM:FBL:AUTO OFF` `:CALC:OBW:LIM:FBL:AUTO?`
Dependencies	Only available in LTE-A and 5G NR Modes
Couplings	When the state of limit bandwidth is `ON`, the bandwidth value is automatically determined by multi-carrier configuration (system bandwidth and freq offset of each component carrier). Otherwise, the bandwidth value depends on user input When the bandwidth value is set manually, the state of limit bandwidth automatically changes to `OFF`
Preset	`ON`
State Saved	Yes
Range	Auto | Man

3.3.8.3 Radio

Contains controls to select link direction.

Direction

Specifies whether the LTE-Advanced signal is an uplink signal or a downlink signal.

The choice of link direction determines the Sync/Format, Chan Profile and Time. Advanced menus all change based on the link direction selected. Also, since downlink and uplink signals use OFDMA and SC-FDMA respectively, the list of trace results available and the default traces presented change based on the link direction parameter.

Remote Command	`[:SENSe]:RADio:STANdard:DIRection DLINk | ULINk` `[:SENSe]:RADio:STANdard:DIRection?`
Example	`:RAD:STAN:DIR DLIN`
Couplings	TDD: Changing direction affects the sync source of periodic trigger source or gate source If Direction is uplink, the sync source is RF burst If Direction is downlink, the sync source is External1 If direction is downlink, the menu Measure PRACH/SRS is disabled and the value is off FDD/TDD: Changing Direction affects many other modulation analysis setup parameters
Preset	DLIN ULIN on E6640A DLIN on E6650A
State Saved	Yes
Range	Downlink|Uplink For E6640A, Direction is restricted to Uplink only, Downlink is not selectable For E6650A, Direction is restricted to Downlink only, Uplink is not selectable

eMTC Analysis

Enable/Disables the eMTC analysis function.

Remote Command	`[:SENSe]:RADio:STANdard:EMTC[:STATe] ON | OFF | 1 | 0` `[:SENSe]:RADio:STANdard:EMTC[:STATe]?`
Example	`:RAD:EMTC:STAT OFF`
Dependencies	This parameter requires N9080EM3E license
Preset	OFF
Backwards Compatibility SCPI	`[:SENSe]:RADio:EMTC[:STATe]`

Interfering Signal Present

Sets whether interfering signal for the intermodulation tests exists or not. If exists, limits are not evaluated over the interference signal frequency range specified by the span and the center frequency parameters in ACP, SEM and Spurious Emissions.

Remote Command	`[:SENSe]:RADio:IMODulation:INTerference[:STATe] OFF | ON | 0 | 1` `[:SENSe]:RADio:IMODulation:INTerference[:STATe]?`
Example	`:RAD:IMOD:INT 1`

	`:RAD:IMOD:INT?`
Preset	OFF
State Saved	Saved in instrument state
Range	Yes|No

Freq Offset from Edge

Sets the center frequency of the interference signal for intermodulation tests. The frequency is set as offset frequency from the BS RF bandwidth edge. Interference Offset Side determines on which side of the BS RF bandwidth the interference signal exists.

Remote Command	`[:SENSe]:RADio:IMODulation:INTerference:FREQuency:OFFSet <freq>` `[:SENSe]:RADio:IMODulation:INTerference:FREQuency:OFFSet?`
Example	`:RAD:IMOD:INT:FREQ:OFFS 5MHz` `:RAD:IMOD:INT:FREQ:OFFS?`
Preset	5MHz
State Saved	Saved in instrument state
Min/Max	0 Hz / 20.0 MHz

Span

Sets the span of the interference signal for intermodulation tests.

Remote Command	`[:SENSe]:RADio:IMODulation:INTerference:SPAN <freq>` `[:SENSe]:RADio:IMODulation:INTerference:SPAN?`
Example	`:RAD:IMOD:INT:SPAN 5MHz` `:RAD:IMOD:INT:SPAN?`
Preset	5 MHz
State Saved	Saved in instrument state
Min/Max	200 kHz / 20.0 MHz

Offset Side

Sets which side of the BS RF bandwidth the interference signal exists on.

Remote Command	`[:SENSe]:RADio:IMODulation:INTerference:SIDE NEGative | POSitive` `[:SENSe]:RADio:IMODulation:INTerference:SIDE?`
Example	`:RAD:IMOD:INT:SIDE POS`

	`:RAD:IMOD:INT:SIDE?`
Preset	POSitive
State Saved	Saved in instrument state

Non-Contiguous Interference Region

Sets the region the interfering signal exists at in the Non-Contiguous mode:

- INNer – The interfering signal exists at the inner region. This setting is only effective when Carrier Alloc is Non-Contiguous. When in Contiguous, the interference region is always outside regardless of the selection of this parameter
- OUTer – The interfering signal exists at either of the outer regions

Remote Command	`[:SENSe]:RADio:IMODulation:INTerference:REGion INNer | OUTer` `[:SENSe]:RADio:IMODulation:INTerference:REGion?`
Example	`:RAD:IMOD:INT:REG OUT` `:RAD:IMOD:INT:REG?`
Preset	OUTer
State Saved	Saved in instrument state

3.3.8.4 Component Carriers

Contains settings that let you configure the analyzer to match the component carriers in your LTE-A signal.

Number of Component Carriers

Specifies how many component carriers are included in LTE-Advanced TDD/FDD measurements. Each component carrier complies with the LTE specifications.

LTE-Advanced TDD/FDD supports a maximum of five component carriers, so the maximum transmission bandwidth is up to 100 MHz.

Remote Command	`[:SENSe]:CCARrier:COUNt <integer>` `[:SENSe]:CCARrier:COUNt?`
Example	`:CCAR:COUN 1` `:CCAR:COUN?`
Notes	The max number of Component carriers can be set greater than one with 9080B/9082B-2FP license
Preset	1

State Saved	Yes
Min	1
Max	5

Carrier Allocation

Specifies the carrier frequency allocation. There are two types of allocation, contiguous and non-contiguous. Non-Contiguous frequency allocation is defined as an allocation where two sub-blocks are separated with a sub-block gap:

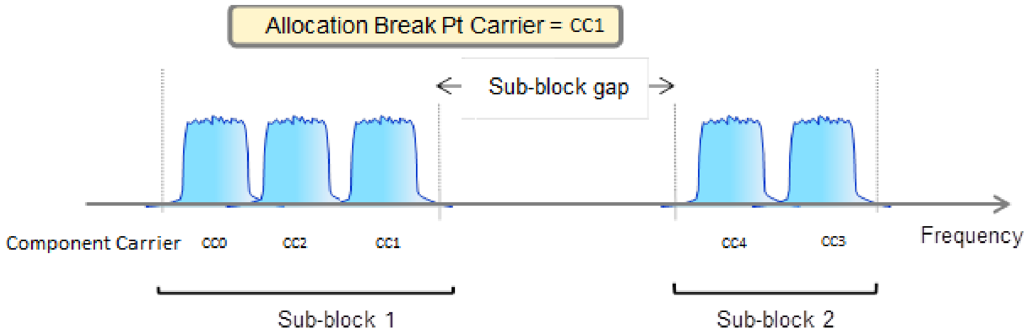
- CONTiguous – All the component carriers belong to one block and no sub-block gap exists
- NCONtiguous – Component carriers are separated into two sub-blocks. Allocation Break Pt Carrier determines how sub-blocks are configured

Remote Command	`[:SENSe]:CCARrier:CONFig:ALLocation CONTiguous | NCONtiguous` `[:SENSe]:CCARrier:CONFig:ALLocation?`
Example	`:CCAR:CONF:ALL CONT` `:CCAR:CONF:ALL?`
Preset	CONTiguous
State Saved	Saved in instrument state
Range	Contiguous|Non-Contiguous

Non-Contiguous Break at

Specifies an allocation break point in non-contiguous carrier allocation. First sub-block starts from the lowest frequency carrier and stops at the allocation break point carrier. Next sub-block starts from the next upper frequency carrier and ends at the highest frequency carrier.

one example is shown below. In the example carrier indices are not in the order of carrier frequency. In the example, Allocation Break Pt Carrier is CC1. It means that sub-block 1 ends at carrier CC1 and sub-block 2 starts at carrier CC4. Sub-block gap is located between carrier CC1 and CC4.



Remote Command	`[:SENSe]:CCARrier:CONFig:ALLocation:NCONtiguous:ABPoint CC0 | … | CC4` `[:SENSe]:CCARrier:CONFig:ALLocation:NCONtiguous:ABPoint?`
Example	`:CCAR:CONF:ALL:NCON:ABP CC0` `:CCAR:CONF:ALL:NCON:ABP?`
Notes	The options CC1~CC4 can be enabled with 9080B/9082B-2FP license
Dependencies	Allocation Break Point is coupled to Number of Component Carriers. For example, Allocation Break Point list will include CC0~CC1 if the number of Component Carriers is 2
Preset	CC0
State Saved	Saved in instrument state
Range	CC0|CC1|CC2|CC3|CC4

Configure Comp Carriers

Lets you perform a detailed configuration of your component carriers, including number of carriers, presets, bandwidth, offset, integration bandwidth, etc.

Configure CCs

Lets you configure System Bandwidth, frequency offsets, and integration bandwidth, and also lets you exclude certain carriers from the measurement.

Number of Component Carriers

See "Number of Component Carriers" on page 2245.

Carrier Allocation

See "Carrier Allocation" on page 2245.

Non-Contiguous Break at

See "Non-Contiguous Break at" on page 2246.

System BW

Enables you to set the system bandwidth of each component carrier for LTE-Advanced / NB-IoT signal (which also determines the total number of resource blocks for Modulation Analysis measurement).

Remote Command	`[:SENSe]:CCARrier0|…|4:RADio:STANdard:BANDwidth B1M4 | B3M | B5M | B10M | B15M | B20M | B200K` `[:SENSe]:CCARrier0|…|4:RADio:STANdard:BANDwidth?`
Example	`:CCAR4:RAD:STAN:BAND B5M`
Preset	B5M
State Saved	Yes
Range	1.4 MHz (6 RB) | 3 MHz (15 RB) | 5 MHz (25 RB) | 10 MHz (50 RB) | 15 MHz (75 RB) | 20 MHz (100 RB) | 200kHz (NB-IoT)
Backwards Compatibility SCPI	`[:SENSe]:RADio:STANdard:BANDwidth`

Measure Carrier

Sets whether to measure this component carrier or not.

Remote Command	`[:SENSe]:CCARrier0|…|4[:STATe] OFF | ON | 0 | 1` `[:SENSe]:CCARrier0|…|4[:STATe]?`
Example	`:CCAR0 ON` `:CCAR0?`
Notes	The command is used with a sub-op code <n> (default=0) to specify the component carrier for configuration. The range of the sub-op code is determined by the number of component carriers
Preset	ON
State Saved	Saved in instrument state
Range	On|Off

Frequency Offset

Sets the component carrier center frequency as offset from the Carrier Ref Frequency.

Remote Command	`[:SENSe]:CCARrier<n>:FREQuency:OFFSet <freq>` `[:SENSe]:CCARrier<n>:FREQuency:OFFSet?`
Example	`:CCAR4:FREQ:OFFS 10MHz` `:CCAR4:FREQ:OFFS?`
Notes	Used with a sub-op code <n> (default=0) to specify the component carrier for configuration. The range of the sub-op code is determined by the number of component carriers
Preset	0Hz
State Saved	Saved in instrument state
Min	-3.5GHz
Max	3.5GHz

Spectrum

Determines if the spectrum of the incoming data is mirrored or not. The actual mirroring is accomplished by conjugating the complex time data.

Note that only the Modulation Analysis measurement and Conformance EVM measurement support this feature.

Remote Command	`[:SENSe]:CCARrier0|…|4:SPECtrum NORMal	INVert` `[:SENSe]:CCARrier0|…|4:SPECtrum?`
Example	`:CCAR0:SPEC INV` `:CCAR0:SPEC?`
Preset	NORM
State Saved	Yes
Range	Normal | Invert
Backwards Compatibility SCPI	`[:SENSe]:SPECtrum`

UL/DL Configuration

Allows you to set the Uplink and Downlink allocation configuration of the signal being measured. The choice of link direction will determine which slot in the frame is used for uplink transmission, and which slot for downlink transmission.

Remote Command	`[:SENSe]:CCARrier0|…|4:RADio:STANdard:ULDL CONF0	…	CONF6` `[:SENSe]:CCARrier0|…|4:RADio:STANdard:ULDL?`
Example	`:CCAR0:RAD:STAN:ULDL CONF0`
Notes	CONF0: Configuration 0 (DSUUUDSUUU) CONF1: Configuration 1 (DSUUDDSUUD)

	CONF2: Configuration 2 (DSUDDDSUDD) CONF3: Configuration 3 (DSUUUDDDDD) CONF4: Configuration 4 (DSUUDDDDDD) CONF5: Configuration 5 (DSUDDDDDDD) CONF6: Configuration 6 (DSUUUDSUUD)
Preset	CONF0
State Saved	Yes
Range	Configuration 0|Configuration 1|Configuration 2|Configuration 3|Configuration 4|Configuration 5|Configuration 6
Backwards Compatibility SCPI	`[:SENSe]:RADio:STANdard:ULDL`

Dw/GP/Up Len

This control allows you to set the DwPTS/GP/UpPTS length configuration of the signal being measured. The choice of link direction will determine the length of DwPTS, GP and UpPTS in the Special Subframe.

Remote Command	`[:SENSe]:CCARrier0|…|4:RADio:STANdard:DGPU CONF0 | … | CONF9` `[:SENSe]:CCARrier0|…|4:RADio:STANdard:DGPU?`
Example	`:CCAR0:RAD:STAN:DGPU CONF0`
Notes	CONF0: Configuration 0 CONF1: Configuration 1 CONF2: Configuration 2 CONF3: Configuration 3 CONF4: Configuration 4 CONF5: Configuration 5 CONF6: Configuration 6 CONF7: Configuration 7 CONF8: Configuration 8 CONF9: Configuration 9
Dependencies	The special sub-frame configuration 9 is only enabled when it is LTE-Advanced TDD
Preset	CONF0
State Saved	Yes
Range	Configuration 0|Configuration 1|Configuration 2|Configuration 3|Configuration 4|Configuration 5|Configuration 6|Configuration 7|Configuration 8|Configuration 9
Backwards Compatibility SCPI	`[:SENSe]:RADio:STANdard:DGPU`

Sidelink Mode

Set the sidelink mode per uplink component carrier. The setting is used to indicate whether the component carrier is cellular LTE or sidelink V2X. There are two modes listed as below:

- None: The component carrier is legacy LTE uplink carrier. The lte uplink parameters per carrier are in scope
- V2X: The component carrier is sidelink V2X carrier. The sidelink parameters per carrier are in scope

Remote Command	`[:SENSe]:CCARrier0|…|4:RADio:SLINk:MODE NONE | V2X` `[:SENSe]:CCARrier0|…|4:RADio:SLINk:MODE?`
Example	`:CCAR4:RAD:SLIN:MODE V2X`
Notes	The setting is available when Direction is Uplink with the required license
State Saved	Yes
Range	None | V2X

CHP Power Integ BW

Specifies the range of integration used in calculating the power in the component carrier s in the CHP measurement.

Remote Command	`[:SENSe]:CCARrier0|…|4:CHPower:BANDwidth:INTegration <freq>` `[:SENSe]:CCARrier0|…|4:CHPower:BANDwidth:INTegration?`
Example	`:CCAR0:CHP:BAND:INT 20MHz` `:CCAR0:CHP:BAND:INT?`
Notes	You must be in LTEATDD/LTEAFDD Mode to use this command. Use :INSTrument:SELect to set the mode
Couplings	When System Bandwidth of the parameter set is changed, the value of this parameter also changes as shown in the following table.

System Bandwidth	CHP Integ BW
1.4 MHz (B1M4)	1.4 MHz
3 MHz (B3M)	3 MHz
5 MHz (B5M)	5 MHz
10 MHz (B10M)	10 MHz
15 MHz (B15M)	15 MHz
20 MHz (B20M)	20 MHz
200 kHz(B200K)	200 kHz

Preset	5 MHz
State Saved	Saved in instrument state
Min	100 kHz
Max	20 MHz
Backwards Compatibility SCPI	`[:SENSe]:CHPower:BANDwidth:INTegration` `[:SENSe]:CHPower:BWIDth:INTegration`

ACP Power Integ BW

Specifies the Measurement Noise Bandwidth used to calculate the power in the component carriers in the ACP measurement.

Remote Command	`[:SENSe]:CCARrier0|…|4:ACPower:BANDwidth[1]|2:INTegration <freq>` `[:SENSe]:CCARrier0|…|4:ACPower:BANDwidth[1]|2:INTegration?`
Example	`:CCAR0:ACP:BAND:INT 20MHz` `:CCAR0:ACP:BAND:INT?`
Notes	Carrier sub op code, 1 is for BTS, 2 for MS. Default is BTS You must be in the LTEATDD/LTEAFDD mode. Use :INSTrument:SELect to set the mode
Couplings	When System Bandwidth of the parameter set is changed, the value of this parameter also changes as shown in the following table.

System Bandwidth	BTS ACP Meas Noise BW	MS ACP Meas Noise BW
1.4 MHz (B1M4)	1.095 MHz	1.08 MHz
3 MHz (B3M)	2.715 MHz	2.7 MHz
5 MHz (B5M)	4.515 MHz	4.5 MHz
10 MHz (B10M)	9.015 MHz	9.0 MHz
15 MHz (B15M)	13.515 MHz	13.5 MHz
20 MHz (B20M)	18.015 MHz	18.0 MHz
200 kHz(B200K)	180 kHz	180 kHz

Preset	4.515 MHz|4.5 MHz
State Saved	Yes
Min	100 kHz
Max	20 MHz
Backwards Compatibility SCPI	`[:SENSe]:ACPower:CARRier[1]|2:LIST:BANDwidth[:INTegration]` `[:SENSe]:ACPower:CARRier[1]|2:LIST:BWIDth[:INTegration]`

SEM Power Integ BW

Specifies the integration bandwidth used to calculate the power in the component carriers in SEM measurement.

Remote Command	`[:SENSe]:CCARrier0|…|4:SEMask:BANDwidth[1]|2:INTegration <freq>` `[:SENSe]:CCARrier0|…|4:SEMask:BANDwidth[1]|2:INTegration?`
Example	`:CCAR0:SEM:BAND:INT 20MHz` `:CCAR0:SEM:BAND:INT?`
Notes	Bandwidth sub op code, 1 is for BTS, 2 for MS. Default is BTS You must be in LTEATDD/LTEAFDD Mode to use this command. Use :INSTrument:SELect to set the mode
Couplings	When System Bandwidth of the parameter set is changed, the value of this parameter also changes as shown in the following table. Note that you cannot set the value exceeding the corresponding System Bandwidth

System Bandwidth	BTS SEM Integ BW	MS SEM Integ BW
1.4 MHz (B1M4)	1.095 MHz	1.08 MHz
3 MHz (B3M)	2.715 MHz	2.7 MHz
5 MHz (B5M)	4.515 MHz	4.5 MHz
10 MHz (B10M)	9.015 MHz	9.0 MHz
15 MHz (B15M)	13.515 MHz	13.5 MHz
20 MHz (B20M)	18.015 MHz	18.0 MHz
200 kHz(B200K)	180 kHz	180 kHz

Preset	4.515 MHz|4.5 MHz
State Saved	Saved in instrument state
Min	100 kHz
Max	20 MHz
Backwards Compatibility SCPI	`[:SENSe]:SEMask:BANDwidth[1]|2:INTegration`

Carrier Config Presets

Lets you configure the Component Carrier presets.

Max BTS RF Bandwidth

Sets max BS RF bandwidth used when the carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:RFBW <freq>` `[:SENSe]:CCARrier:CONFig:RFBW?`
Example	`:CCAR:CONF:RFBW 40MHz` `:CCAR:CONF:RFBW?`
Preset	40MHz
State Saved	Saved in instrument state
Min	1.4MHz
Max	200 MHz

Carrier Spacing Delta

Sets delta channel spacing used when the carrier configuration preset runs. Channel spacing is determined from this value and the default channel spacing defined in the standard, i.e. Channel spacing = (BW_{chan1} + BW_{chan2}) * 0.5 + [the delta spacing]. Since this value is a difference from the default spacing, this value can be negative to allow narrower channel spacing. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:SPACing:DELTa <freq>` `[:SENSe]:CCARrier:CONFig:SPACing:DELTa?`
Example	`:CCAR:CONF:SPAC:DELT -200kHz` `:CCAR:CONF:SPAC:DELT?`
Preset	0Hz
State Saved	Saved in instrument state
Min	-1.0 MHz
Max	10.0 MHz

Preset ETC

The ETC configuration is applied. The component carrier parameters are dynamically changed using values of the parameters of each test configuration under Carrier Config Presets menu when some test configuration is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig NONE | ETC1 | ETC2 | ETC3` `[:SENSe]:CCARrier:CONFig?`

Example	`:CCAR:CONF ETC1` `:CCAR:CONF?`
Notes	The control for NONE is not available
State Saved	Saved in instrument state
Range	ETC1|ETC2|ETC3

ETC1 Attributes

Sets ETC1 carrier configuration.

Max Number of Component Carriers

Sets max component carriers placed when the ETC1 carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC1:CMAX <integer>` `[:SENSe]:CCARrier:CONFig:ETC1:CMAX?`
Example	`:CCAR:CONF:ETC1:CMAX 5` `:CCAR:CONF:ETC1:CMAX?`
Preset	5
State Saved	Saved in instrument state
Max	5
Min/Max	1

Component Carrier System BW

Sets bandwidth of the component carriers placed when the ETC1carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC1:BANDwidth B1M4 | B3M | B5M | B10M | B15M | B20M | B200K` `[:SENSe]:CCARrier:CONFig:ETC1:BANDwidth?`
Example	`:CCAR:CONF:ETC1:BAND B5M` `:CCAR:CONF:ETC1:BAND?`
Preset	B5M
State Saved	Saved in instrument state
Range	1.4MHz|3MHz|5MHz|10MHz|15MHz|20MHz|200kHz

Component Carrier Narrowest BW

Sets narrowest bandwidth of the component carriers placed when the ETC1 carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC1:BANDwidth:NARRowest B1M4 | B3M | B5M | B10M | B15M | B20M | B200K` `[:SENSe]:CCARrier:CONFig:ETC1:BANDwidth:NARRowest?`
Example	`:CCAR:CONF:ETC1:BAND:NARR B1M4` `:CCAR:CONF:ETC1:BAND:NARR?`
Preset	B1M4
State Saved	Saved in instrument state
Range	1.4MHz|3MHz|5MHz|10MHz|15MHz|20MHz|200kHz

ETC2 Attributes

Sets ETC2 carrier configuration.

Max Number of Component Carriers

Sets max component carriers placed when the ETC2 carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC2:CMAX <integer>` `[:SENSe]:CCARrier:CONFig:ETC2:CMAX?`
Example	`:CCAR:CONF:ETC2:CMAX 5` `:CCAR:CONF:ETC2:CMAX?`
Preset	5
State Saved	Saved in instrument state
Min	1
Max	5

Carrier Side (with BTS RF BW)

Select the side of RF bandwidth to place the ETC2 component carriers. When this value is changed, the carrier configuration preset is initiated.

- NEGative - Negative (lower) edge of RF bandwidth. If the option is selected, the available component carriers will be placed sequentially from the lower edge of the RF bandwidth starting from first
- POSitive - Positive (upper) edge of RF bandwidth, If the option is selected, the available component carriers will be placed sequentially from the upper edge of the RF bandwidth starting from first

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC2:BANDwidth:SIDE NEGative | POSitive` `[:SENSe]:CCARrier:CONFig:ETC2:BANDwidth:SIDE?`
Example	`:CCAR:CONF:ETC2:BAND:SIDE NEG` `:CCAR:CONF:ETC2:BAND:SIDE?`
Preset	NEGative
State Saved	Saved in instrument state
Range	NEGative|POSitive

Component Carrier System BW

Sets carrier bandwidth of the component carriers placed when the ETC2 carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC2:BANDwidth:CARRier[1]|2|…|5 B1M4 | B3M | B5M | B10M | B15M | B20M | B200K` `[:SENSe]:CCARrier:CONFig:ETC2:BANDwidth:CARRier?`
Example	`:CCAR:CONF:ETC2:BAND:CARR B5M` `:CCAR:CONF:ETC2:BAND:CARR?`
Dependencies	The Carrier Bandwidth is coupled to Max Component Carriers. The settings are enabled following the Max Component Carriers. For example, the 1st Carrier Bandwidth and 2nd Carrier Bandwidth will be available if the Max Component Carriers is 2
Preset	B5M
State Saved	Saved in instrument state
Range	1.4MHz|3MHz|5MHz|10MHz|15MHz|20MHz|200kHz

ETC3 CC Bandwidth

Sets the bandwidth of the component carriers placed when the ETC3 carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC3:BANDwidth B1M4 | B3M | B5M | B10M | B15M | B20M | B200K`

	`[:SENSe]:CCARrier:CONFig:ETC3:BANDwidth?`
Example	`:CCAR:CONF:ETC3:BAND B5M` `:CCAR:CONF:ETC3:BAND?`
Preset	B5M
State Saved	Saved in instrument state
Range	1.4MHz|3MHz|5MHz|10MHz|15MHz|20MHz|200kHz

3.3.8.5 Meas Standard

Enables you to access Preset to Standard functions.

In LTE-Advanced TDD Mode, the parameters under Predefined Params impact the gate or trigger length and delay of the following measurements:

- Monitor Spectrum
- Channel Power
- ACP
- Power Stat CCDF
- Occupied BW
- Spectrum Emission Mask
- Spurious Emission

In LTE-Advanced FDD Mode, the Predefined Parameters in this section are used in the Transmit On/Off Power measurement. The Modulation Analysis measurement has its specific Predefined Parameters setting.

In LTE V2X Mode, Predefined parameters apply to all LTE V2X measurements.

System BW

Sets the demodulator to the specified bandwidth and configures the settings of every component carrier according to the default values listed in table for the current direction (Uplink or Downlink).

For example, when Number of Component is 3, after executing the command RAD:STAN:PRES B5M or selecting corresponding Bandwidth in the dropdown menu, all the 3 component carriers are configured as 5Mhz bandwidth, and all the settings of these 3 component carriers are set according to the table.

Remote	`[:SENSe]:RADio:STANdard:PRESet B1M4 | B3M | B5M | B10M | B15M | B20M | B200K`

Command	
Example	`:RAD:STAN:PRES B5M`
Notes	B200K selection is available in LTE-A FDD mode B200K option is for NB-IoT which requires N9080EM3E license
Couplings	Preset To Standard presets parameter values listed in section “Values for each Preset To Standard”. And the system bandwidth of each component carrier under the Component Carrier Setup will be preset to the selected one
Preset	B5M
State Saved	Yes
Range	1.4 MHz (6 RB) | 3 MHz (15 RB) | 5 MHz (25 RB) | 10 MHz (50 RB) | 15 MHz (75 RB) | 20 MHz (100 RB) | 200 kHz (NB-IoT)

UL/DL Config

Sets the TDD UL/DL Allocation parameter of each carrier to the selected value.

Remote Command	`[:SENSe]:RADio:STANdard:PRESet:ULDL CONF0 | … | CONF6` `[:SENSe]:RADio:STANdard:PRESet:ULDL?`
Example	`:RAD:STAN:PRES:ULDL CONF0`
Notes	CONF0: Configuration 0 (DSUUUDSUUU) CONF1: Configuration 1 (DSUUDDSUUD) CONF2: Configuration 2 (DSUDDDSUDD) CONF3: Configuration 3 (DSUUUDDDDD) CONF4: Configuration 4 (DSUUDDDDDD) CONF5: Configuration 5 (DSUDDDDDDD) CONF6: Configuration 6 (DSUUUDSUUD)
Dependencies	When the setting is selected, the ULDL Alloc per component carrier under the Component carrier Setup will be preset to the selected value
Preset	CONF0
State Saved	Yes
Range	Configuration 0|Configuration 1|Configuration 2|Configuration 3|Configuration 4|Configuration 5|Configuration 6

Dw/GP/Up Len

Sets the TDD special sub-frame configuration of each component carrier to the selected value.

Remote Command	`[:SENSe]:RADio:STANdard:PRESet:DGPU CONF0 | … | CONF9` `[:SENSe]:RADio:STANdard:PRESet:DGPU?`

Example	`:RAD:STAN:PRES:DGPU CONF0`
Notes	CONF0: Configuration 0 CONF1: Configuration 1 CONF2: Configuration 2 CONF3: Configuration 3 CONF4: Configuration 4 CONF5: Configuration 5 CONF6: Configuration 6 CONF7: Configuration 7 CONF8: Configuration 8 CONF9: Configuration 9
Dependencies	When the setting is selected, the Dw/GP/Up Len per Component Carrier under the Component Carrier Setup will be preset to the selected value The special sub-frame configuration 9 is only enabled when it is LTE-Advanced TDD
Preset	CONF0
State Saved	Yes
Range	Configuration 0|Configuration 1|Configuration 2|Configuration 3|Configuration 4|Configuration 5|Configuration 6|Configuration 7|Configuration 8|Configuration 9

Analysis Slot

Specifies the starting analysis slot. The measurement will adjust the gate delay or trigger delay according to this parameter.

Remote Command	`[:SENSe]:RADio:SLOT TS0 | TS1 | DPTS1 | UPTS1 | TS4 | TS5 | TS6 | TS7 | TS8 | TS9 | TS10 | TS11 | TS12 | TS13 | TS14 | TS15 | TS16 | TS17 | TS18 | TS19` `[:SENSe]:RADio:SLOT?`
Example	`:RAD:SLOT TS0`
Couplings	Measurement's gate length or meas interval will couple to the parameter
Preset	TS0
State Saved	Yes
Range	TS0 | TS1 | DwPTS1 | UpPTS1 | TS4 | TS5 | TS6 | TS7 | TS8 | TS9 | TS10 | TS11 | TS12(DwPTS2) | TS13 (UpPTS2) | TS14 | TS15 | TS16 | TS17 | TS18 | TS19

Meas Interval

This parameter specifies the desired slots count that needs to be analyzed. The measurement will adjust the gate length or meas interval according to this parameter.

For NB-IoT uplink cases scenarios, when Measure NPRACH is Off, this parameter indicates not only the slots' count to be analyzed, but the time elapse of the off power measurements as well.

In LTE-A FDD Mode, this parameter only appears in the Transmit On|Off Power measurement.

Remote Command	`[:SENSe]:RADio:MINTerval <integer>` `[:SENSe]:RADio:MINTerval`
Example	`:RAD:MINT 1`
Notes	The backwards compatible command [:SENSe]:PVTime:MINTerval is available in LTE FDD & LTE-A FDD Modes
Dependencies	This parameter is disabled when all the below conditions are met at the same time: – System BW is "200 kHz (NB-IoT)" – Direction is "uplink" – NB-IoT Subcarrier Spacing is "3.75kHz" – Meas NPRACH is "OFF"
Couplings	Disabled when the "Measure PRACH" is in scope and its value is not off, then the actual meas interval is the length PRACH or SRS channel For NB-IoT case scenario, when the parameter is disabled, its value is automatically determined by both Meas NPRACH: **Meas NPRACH** / **Meas Interval** Preamble0 / 3 slots Preamble1 / 4 slots
Preset	1
State Saved	Yes
Min	1
Max	20, when System BW is NOT "200 kHz (NB-IoT) 16, otherwise
Backwards Compatibility SCPI	LTE: `[:SENSe]:PVTime:MINTerval`

CP Length

Specifies whether the cyclic prefix is configured as NORMal or EXTended for power measurement. The parameter will affect the gate length or meas interval parameters.

In LTE-A FDD Mode, this parameter only appears in the Transmit On|Off Power measurement.

Remote Command	`[:SENSe]:RADio:CPLength NORMal | EXTended` `[:SENSe]:RADio:CPLength?`
Example	`:RAD:CPL NORM`
Notes	The backwards compatible SCPI command [:SENSe]:PVTime:CPLength is available in LTE FDD & LTE-A FDD Modes
Dependencies	Disabled when System BW is set to “200 kHz (NB-IoT)” and Direction is “uplink”
Couplings	Set to NORMal when System BW is set to “200 kHz (NB-IoT)”
Preset	NORMal
State Saved	Yes
Range	Normal|Extended
Backwards Compatibility SCPI	LTE: `[:SENSe]:PVTime:CPLength`

Measure PRACH/SRS

Specifies whether the analysis slot is used for PRACH channel or SRS and the PRACH preamble format of the analysis slot.

The measurement will adjust the gate length or meas interval according to this parameter.

Remote Command	`[:SENSe]:RADio:MEASure OFF | PPF0 | PPF1 | PPF2 | PPF3 | PPF4 | SRS | DSRS` `[:SENSe]:RADio:MEASure?`
Example	`:RAD:MEAS OFF`
Couplings	If direction is downlink, the control is disabled and the value is set to off If this control value is not off, Meas Interval is disabled
Preset	OFF
State Saved	Yes
Range	Off|Preamble 0|Preamble 1|Preamble 2|Preamble 3|Preamble 4|SRS|DSRS

Reference Config

Specifies which component carrier’s ULDL Allocation Configuration and Dw/Up Length Configuration settings are used to adjust time slot to be measured automatically. For Modulation Analysis measurement, this control specifies which CC is used as the reference CC for time alignment results.

In LTE-A FDD Mode, this parameter only appears in the Transmit On|Off Power and Modulation Analysis measurements.

Remote Command	`[:SENSe]:RADio:RCONfig CC0 | … | CC4`

	`[:SENSe]:RADio:RCONfig?`
Example	`:RAD:RCON CC0`
Notes	The options CC1~CC4 can be enabled with 9080B/9082B-2FP license
Dependencies	Reference Configuration is coupled to Number of Component Carriers. For example, reference configuration list will include CC0~CC1 if the number of Component Carriers is 2
Preset	CC0
State Saved	Yes
Range	CC0|CC1|CC2|CC3|CC4

3.3.8.6 Advanced

Contains controls for setting advanced functions of the instrument. This tab does not appear in EXM, nor in VXT models M9420A/10A/11A.

Noise Floor Extension

Lets you configure **Noise Floor Extension** (NFE). All Modes that support NFE let you set it on or off. Additionally, some Modes support *two* “on” states for NFE, **Full** and **Adaptive**, as described below.

Adaptive Option Support

At present (Release: X-Apps 2024), support for **Adaptive** NFE is as follows:

Mode	Measurements	Supports Adaptive NFE?
BT	ACP, IBEM, IBSP	No
CQM	MON	Yes
EDGEGSM	EORF, ETSP, MON	No
EMI	APD, DAN, FSC, MON, RTSC, SCH	Yes
LTEAFDD	PVT	No
LTEATDD	PVT	No
MSR	ACP, CHP, MON, OBW, SEM, SPUR	Yes
NR5G	PVT	No
PNOISE	LPL, MON, SFR	No
SA	SAN	Yes
SRCOMMS	ACP, CHP, MON, OBW, SEM, SPUR	Yes
VMA	ACP, CHP, OBW, SEM, SPUR	Yes
WCDMA	ACP, CHP, MON, OBW, SEM, SPUR	Yes
WLAN	CHP, MON, OBW, SEM, SPUR	Yes

The menus and command options are as follows:

NFE State	Modes with Adaptive NFE	Modes without Adaptive NFE	SCPI
Off	Off	Off	See "NFE On/Off Command" on page 449
On	Full	On	
Adaptive	Adaptive	n/a	See "Adaptive NFE Command" on page 450

As shown in the table above, the **On** state (in Modes that do not support **Adaptive** NFE) matches the **Full** state in Modes that *do* support **Adaptive** NFE.

To maintain SCPI backwards compatibility, the existing command to turn NFE on or off is retained, and a new command is added to set the state to turn **Adaptive**`ON` or `OFF`:

- `[:SENSe]:CORRection:NOISe:FLOor ON|OFF|1|0` is retained, with the default changed to `ON` for Modes that support **Adaptive** NFE
- `[:SENSe]:CORRection:NOISe:FLOor:ADAPtive ON|OFF|1|0` is added (for certain Modes), default = `ON`

When NFE is **On** or **Full**, the expected noise power of the instrument (derived from a factory calibration) is subtracted from the trace data. This will usually reduce the apparent noise level by about 10 dB in low band, and 8 dB in high band (>~3.6 GHz).

NFE works with any RBW, VBW, detector, any setting of **Average Type**, any amount of trace averaging, and any signal type. It is ineffective when the trace is not smoothed (smoothing processes include narrow VBWs, trace averaging, and long sweep times with the detector set to **Average** or **Peak**). It works best with extreme amounts of smoothing, and with the average detector, with the **Average Type** set to **Power**.

In those cases where the cancellation is ineffective, it nonetheless has no undesirable side-effects. There is no significant speed impact to having **Noise Floor Extension** on.

The best accuracy is achieved when substantial smoothing occurs in each point before trace averaging. Thus, when using the **Average** detector, results are better with long sweep times and fewer trace averages. When using the **Sample** detector, the VBW filter should be set narrow with less trace averaging, instead of a wide VBW filter with more trace averaging.

NOTE **Noise Floor Extension has no effect unless the RF Input is selected, so when External Mixing is selected, it does nothing.**

For more details, see "Optimal Detector & Averaging Selections" on page 450 and "Recalibration of Noise Floor" on page 451.

Pros & Cons of Adaptive NFE

Adaptive NFE provides an alternative to fully-on or fully-off NFE. Fully-on NFE can, notably in cases with little or no averaging of the spectrum, result in a display that is distractingly unfamiliar in the variability in response to low level signals. Fully-off NFE fails to achieve the potential improvement in dynamic range and associated accuracy of measurement of low-level signals. **Adaptive** NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement—those settings with high degrees of variance reduction through some variant of averaging. When the potential improvement is small, the display acts like the fully-off case, and when it is high, it acts like the fully-on case, and in-between, application is a compromise between attractiveness and effectiveness.

In **Adaptive** NFE, there is not the same dramatic visual impact on the noise floor as there is in **Full** NFE. **Adaptive** NFE controls the amount of correction that is applied based on other instrument settings like RBW, averaging and sweep time. **Adaptive** NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement, such as settings that provide more averaging. The result is that when not much averaging is being performed, the signal displays more like the fully-off case; and when lots of averaging is being performed, the signal displays more like the **Full** NFE case.

Adaptive NFE is recommended for general-purpose use. For fully-ATE (automatic test equipment) applications, where possible distraction of the instrument user is not a risk, **Full** NFE is recommended.

NFE On/Off Command

Remote Command	`[:SENSe]:CORRection:NOISe:FLOor ON | OFF | 1 | 0` `[:SENSe]:CORRection:NOISe:FLOor?`
Example	`:CORR:NOIS:FLO ON`
Dependencies	Only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear. In those cases, the SCPI command is accepted without error, but has no effect
Couplings	When NFE is enabled in any Mode manually, a prompt is displayed reminding you to perform the **Characterize Noise Floor** operation if it is needed When NFE is enabled through SCPI, and a **Characterize Noise Floor** operation is needed, an error is entered in the system error queue
Preset	Unaffected by **Mode Preset.** Turned `ON` at startup and by **Restore Mode Defaults** in Modes that support **Adaptive.** Turned `OFF` at startup and by **Restore Mode Defaults** in Modes that do *not* support **Adaptive** In Modes that support **Adaptive** NFE, the default (preset) state of NFE is **Adaptive.** In Modes that do not support **Adaptive** NFE, the default state of NFE is **Off**
State Saved	No

Adaptive NFE Command

Only effective in instruments with the NFE or NF2 license installed, and in Modes that support **Adaptive** NFE. For coverage, see "Adaptive Option Support" on page 447 above.

For all other cases, the SCPI command below is accepted without error, but has no effect.

Remote Command	`[:SENSe]:CORRection:NOISe:FLOor:ADAPtive ON | OFF | 1 | 0` `[:SENSe]:CORRection:NOISe:FLOor:ADAPtive?`

Example	First turn NFE on, this is **Full** mode
	`:CORR:NOIS:FLO ON`
	Then set it to **Adaptive**
	`:CORR:NOIS:FLO:ADAP ON`

Couplings	To maintain backwards compatibility, sending :`CORR:NOIS:FLO ON` turns NFE **Adaptive**`OFF`. To turn **Adaptive** on, you must issue the commands in the proper order, as shown in the example above
Preset	Not affected by **Mode Preset**, but set to `ON` at startup and by **Restore Mode Defaults**
State Saved	No

Optimal Detector & Averaging Selections

Note that some measurements do not allow you to switch the **Detector** type (which is set by default to **Average**), so the discussion of detector types here is irrelevant for those measurements. Similarly, some measurements do not allow you to set **Average Type** (set by default to `LOG`), so that discussion here is irrelevant in those cases.

The instrument is characterized in the factory (or during a field calibration) with a model of the noise, referred to the input mixer, versus frequency in each band and path combination. Bands are 0 (low band) and 1 through 4 (high band) in a 26.5 GHz instrument, for example. Paths include normal paths, preamp paths, the electronic attenuator, etc.

In most band/path combinations, the noise can be well characterized based on just two parameters and the instrument frequency response before compensation for frequency-dependent losses.

After the noise density at the input mixer is estimated, the effects of the input attenuator, RBW, detector, etc. are computed to obtain the estimated input-port-referred noise level.

In the simplest case, the measured power (signal plus analyzer noise) in each display point (bucket) is compensated by subtracting the estimated noise power, leaving just the signal power. This is the operation when **Detector** is **Average** and **Average Type** is set to **Power** (`RMS`).

For best operation, **AverageDetector** (default) and **Average Type**. = **Power** are recommended, as already stated. In other cases, operation is often not quite as good but still highly effective. Other **Detector** options, when available, behave as follows:

Positive Peak	The noise floor is estimated based on the RBW and the duration of the bucket using the same equations used in the noise marker function. The voltage of the noise is subtracted from the voltage of the observed signal-plus-noise measurement to compute the estimated signal voltage **Positive Peak** is one example of processing that varies with detector to give good estimates of the signal level without the analyzer noise For pulsed-RF, **Positive Peak** can still give excellent effectiveness FFT analysis does not work well, and does not perform NFE well, with pulsed-RF signals, so this combination is *not* recommended
Negative Peak	Not very useful
Sample	Works well, but never better than **Average** , because it does not smooth as well
Normal	A combination of peak and negative peak behaviors, and works about as well as these

For best operation, extreme smoothing is desirable, as already stated. Using narrow VBWs works well, but using very long bucket durations and the average detector works best. Reducing the number of trace points makes the buckets longer.

For best operation, **Average Type** = **Power** (`RMS`) is optimal (when this option is available). When making CW measurements in the presence of noise without NFE, averaging on the decibel scale has the advantage of reducing the effect of noise. Using NFE with **Average Type** = **Log-Power** (`LOG`) is not synergistic, though; NFE with **Average Type** = **Power** (`RMS`) works a little better than NFE with `LOG`.

The results from NFE with internal preamp can often be lower than the theoretical noise in a signal source at room temperature, a noise density of -174 dBm/Hz. This is expected and useful behavior, because NFE is designed to report the amount of input signal that exceeds the thermal noise, not the amount that includes the thermal noise. This can be a useful behavior because thermal noise often interferes with what you want to measure, instead of being part of what you want to measure. Note that NFE is not adequately accurate to always be able to read below kTB.

Recalibration of Noise Floor

In instruments with the NF2 license installed, the calibrated noise floor used by **Noise Floor Extension** should be refreshed periodically. Keysight recommends that the **Characterize Noise Floor** operation be performed after the first 500 hours of operation, *and* once every calendar year. To do this, use "Characterize Noise Floor" on page 2392, under **System**, **Alignments**, **Advanced**. If you have not done this yourself at the recommended interval, then when you turn on **Noise Floor Extension**, the instrument will prompt you to do so with a dialog stating:

This action will take several minutes to perform. Please disconnect all cables from the RF input and press Enter to proceed. Press ESC to cancel, or Postpone to postpone for a week

If you cancel, you will be prompted again the next time you turn NFE on. If you postpone, you will be prompted again after a week passes and you then turn NFE on.

IF Gain

Sets the **IF Gain** function to one of:

Setting	SCPI	Comments
Auto	`AUTO = ON`	Auto
Low	`OFF` `AUTO = OFF`	Low Gain
High	`ON` `AUTO = OFF`	High Gain

This setting affects sensitivity and IF overloads. It only applies to the RF input; not to the baseband I/Q input.

Remote Command	`[:SENSe]:OBWidth:IF:GAIN[:STATe] ON | OFF | 1 | 0`
	`[:SENSe]:OBWidth:IF:GAIN[:STATe]?`
	`[:SENSe]:OBWidth:IF:GAIN:AUTO[:STATe] ON | OFF | 1 | 0`
	`[:SENSe]:OBWidth:IF:GAIN:AUTO[:STATe]?`

Example	`:OBW:IF:GAIN ON`
	`:OBW:IF:GAIN?`
	`:OBW:IF:GAIN:AUTO OFF`
	`:OBW:IF:GAIN:AUTO?`

Dependencies	Has no effect when the U7227A USB Preamplifier is connected. This is not annotated or reflected on any control; there are no controls grayed-out nor any SCPI locked out. The instrument simply behaves as though both IF Gain is set to Low regardless of the setting on the control Not available in VXT models M9420A/10A/11A, EXM, or UXM
Couplings	**Auto** sets **IF Gain** to High (`ON`) under any of the following conditions: – The input attenuator is set to 0 dB, or – The preamp is turned on and the frequency range is under 3.6 GHz For other conditions, **Auto** sets **IF Gain** to Low (`OFF`)

Preset	`OFF` `OFF`
State Saved	Saved in instrument state
Range	Low Gain | High Gain

3.3.8.7 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, "Global Center Freq" on page 2276) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to `ON`, it applies to all Modes that support Global settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched `ON`, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Frequency** remains unchanged.

Adjusting the **Center Frequency** of any Mode that supports Global Settings, while **Global Center Freq** is `ON`, modifies the **Global Center Freq**.

When **Global Center Freq** is switched `OFF`, the **Center Frequency** of the current Mode is unchanged, but now the **Center Frequency** of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is `ON`, the **Global Center Freq** is preset to the preset **Center Frequency** of the current Mode.

This function resets to `OFF` when "Restore Defaults" on page 2278 is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:FREQuency:CENTer ALL | NONE` `:INSTrument:COUPle:FREQuency:CENTer?`
Example	`:INST:COUP:FREQ:CENT ALL` `:INST:COUP:FREQ:CENT?`
Preset	Set to `OFF` on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	`ALL|NONE`

Preset	`OFF`
Backwards Compatibility SCPI	`:GLOBal:FREQuency:CENTer[:STATe] 1 | 0 | ON | OFF` `:GLOBal:FREQuency:CENTer[:STATe]?`

Global EMC Std

When this control is switched `ON`, the current Mode’s EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the **Global EMC Std**, so you can switch between any of these Modes and the EMC Std remains unchanged.

Adjusting the EMC Std of any Mode that supports Global settings, while **Global EMC Std** is `ON` modifies the **Global EMC Std**.

When **Global EMC Std** is switched `OFF`, the EMC Std of the current Mode remains unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is `ON`, **Global EMC Std** is preset to the preset EMC Std of the current Mode.

This function resets to `OFF` when "Restore Defaults" on page 2278 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:EMC:STANdard ALL | NONE` `:INSTrument:COUPle:EMC:STANdard?`
Example	`:INST:COUP:EMC:STAN ALL` `:INST:COUP:EMC:STAN?`
Dependencies	Only available if Option EMC is installed
Preset	Set to `OFF` on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	`ALL | NONE`

Extend Low Band

The software maintains a Mode Global value called **Extend Low Band**.

Under the current sweep configuration crossing over two bands, when **Extend Low Band** is turned `ON`, the instrument checks whether one band can cover the whole sweep frequency range or not. If it can, then the instrument locks the band; otherwise, it does nothing (the band crossover occurs).

This function does *not* work when **Band Lock** under **System** > **Service** > **Lock Functions** is not -1 (no Band Lock). In that case, **Band Lock** takes priority over **Extend Low Band**.

This function resets to `OFF` when "Restore Defaults" on page 2278 is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:FREQuency:BAND:EXTend 0 | 1 | ON | OFF` `:INSTrument:COUPle:FREQuency:BAND:EXTend?`
Example	`:INST:COUP:FREQ:BAND:EXT 1` `:INST:COUP:FREQ:BAND:EXT?`
Preset	Set to `OFF` by **Global** Settings > **Restore Defaults** and **System** > **Restore Defaults** > **All Modes**
Range	`ON|OFF`

Restore Defaults

Resets all functions in the **Global** settings menu to `OFF`. Pressing **System**, **Restore Defaults**, **All Modes** has the same effect.

Remote Command	`:INSTrument:COUPle:DEFault`
Example	`:INST:COUP:DEF`
Backwards Compatibility SCPI	`:GLOBal:DEFault`

3.3.9 Sweep

Accesses controls to configure and control the acquisition of data, and the X-axis parameters of the instrument.

Depending on the selected mode and measurement, these controls might include: **Sweep Time**, **Continuous/Single**, **Pause/Resume**, **X Scale** and **Number of Points**.

3.3.9.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep Time

Controls the time the instrument takes to sweep the current frequency span in swept measurements, displays the sweep time in swept measurements, and displays the equivalent Sweep Time in FFT measurements.

When **Sweep Time** is in Auto, the instrument computes a time that will give accurate measurements based on other settings, such as RBW and VBW.

You can select a shorter sweep time to improve the measurement throughput (with some potential unspecified accuracy reduction), but the **Meas Uncal** indicator will appear if the sweep time you set is less than the calculated Auto Sweep time.

You can also select a longer sweep time, which can be useful (for example) for obtaining accurate insertion loss measurements on very narrowband filters.

NOTE Significantly faster sweep times are available with Option FS1.

NOTE The **Meas Uncal** (measurement uncalibrated) warning is displayed in the Status Bar at the bottom of the screen when the manual Sweep time entered is faster than the time computed by the instrument's Sweep time equations, that is, the Auto Sweep Time. The instrument's computed Sweep time will provide accurate measurements; if you sweep faster than this your measurements may be inaccurate. A **Meas Uncal** condition may be corrected by returning the Sweep Time to Auto; by entering a longer Sweep Time; or by choosing a wider RBW and/or VBW.

NOTE On non-sweeping hardware, this control is grayed-out. The value shown on this control is an estimate. It is the measurement's turnaround time, which is the sum of signal acquisition time, FFT time, and other overhead time, to complete the entire span of the measurement. If you need to specify the same "Sweep Time" as you would for sweeping hardware, send `[:SENSe]:<meas>:SWEep:TIME <time>`. The measurement emulates the "Sweep Time" effect, but this emulation is not straightforward, and therefore the behavior is not specified. Instead, we recommend using Minimum Acquisition Time, which provides better control.

Remote Command	`[:SENSe]:<meas>:SWEep:TIME <time>` `[:SENSe]:<meas>:SWEep:TIME?`

Example	Channel Power measurement:
	`:CHP:SWE:TIME 25ms`
	`:CHP:SWE:TIME?`

Notes	In the ACP measurement in WCDMA Mode, this parameter is preset by **Meas Method** selection. Preset values are as follows: – IBW: 29 ms – IBWR: 108 ms – FAST 7.5 ms
Dependencies	On non-sweeping hardware, this control is grayed out, and the Auto/Man toggle disappears. The read-only control shows estimated sweep time In those instruments, "Minimum Acquisition Time" on page 2127 is available
Couplings	Coupled to **Span**, **RBW**, **VBW**, and **Sweep Time Rules** when **Sweep Time** is set to Auto; **Sweep Time** changes when these parameters are changed When you manually set a value when in the **Auto** state, the state automatically changes to **Man**
Preset	Automatically Calculated unless noted below

	WCDMA Mode – Channel Power: 1.0 msOBW: 32.6 ms – ACP: 29 ms
State Saved	Saved in instrument state
Min	Other than non-sweeping hardware: Typically, 1 ms Non-sweeping hardware: N/A In the ACP measurement, when **Meas Method** is **Fast Power**, the minimum sweep time is span-dependent and automatically calculated
Max	Other than non-sweeping hardware: 4000 s Non-sweeping hardware: N/A
Annotation	The sweep time is displayed in the lower-right corner of the screen. The number of points is displayed parenthetically, as: Sweep 13.3 ms (1001 points) A “#” mark appears before “Sweep” in the annotation when it is switched from Auto to Manual coupling
Status Bits/OPC dependencies	Meas Uncal is Bit 0 in the register: `STATus:QUEStionable:INTegrity:UNCalibrated`

Auto Function

Remote Command	`[:SENSe]:<meas>:SWEep:TIME:AUTO OFF | ON | 0 | 1` `[:SENSe]:<meas>:SWEep:TIME:AUTO?`

Example	Channel Power measurement:
	`:CHP:SWE:TIME:AUTO OFF`
	`:CHP:SWE:TIME:AUTO?`

Preset	WCDMA Mode: `OFF` All others: `ON`

Minimum Acquisition Time

Available on non-sweeping hardware.

Specifies the minimum acquisition time for each “chunk” of the measurement result. The instrument automatically divides Span into multiple chunks if needed. Therefore, the total signal acquisition time for the entire Span is:

~(>~Minimum Acquisition Time) * (The number of chunks)

When in Auto, this parameter’s value is determined by other parameters, such as **Span**, **RBW** and **VBW**.

You can manually increase this parameter value from this Auto value.

If increased, the instrument acquires signal for the specified time duration for each chunk. It performs additional FFTs, and averages or peak-holds the FFT results for a chunk, depending on **Detector** settings.

Note that the actual acquisition time for each chunk may exceed the **Minimum Acquisition Time** value, in order to satisfy FFT time required by other parameters, and to perform an integer number of FFTs.

Remote Command	`[:SENSe]:<meas>:SWEep:ACQuisition:TIME <time>`
	`[:SENSe]:<meas>:SWEep:ACQuisition:TIME?`
	`<meas>` is the identifier for the current measurement; any one of `CHPower-|ACPower|OBWidth|MONitor`

Example	Channel Power measurement
	`:CHP:SWE:ACQ:TIME 500 ms`
	`:CHP:SWE:ACQ:TIME?`

Dependencies	Available only on non-sweeping hardware
Couplings	Coupled to **Span**, **RBW**, and **VBW** when in the Auto state When you manually set a value when in the **Auto** state, the state automatically changes to **Man**
Preset	Automatically calculated
State Saved	Saved in instrument state
Min	100 ns
Max	4.00 ks

Auto Function

Remote Command	`[:SENSe]:<meas>:SWEep:ACQuisition:TIME:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:<meas>:SWEep:ACQuisition:TIME:AUTO?`
	`<meas>` is the identifier for the current measurement; any one of `CHPower-|ACPower|OBWidth|MONitor`

Example	Channel Power measurement: `:CHP:SWE:ACQ:TIME:AUTO OFF`
Preset	`ON`

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See "More Information" on page 459

Remote Command	`:INITiate:CONTinuous OFF | ON | 0 | 1` `:INITiate:CONTinuous?`

Example	Put instrument into **Single** measurement operation:
	`:INIT:CONT 0`
	`:INIT:CONT OFF`
	Put instrument into **Continuous** measurement operation:
	`:INIT:CONT 1`
	`:INIT:CONT ON`

Preset	`ON` Note that `:SYST:PRES` sets `:INIT:CONT` to `ON`, but `*RST` sets `:INIT:CONT` to `OFF`
State Saved	Saved in instrument state
Annunciation	The **Single/Continuous** icon in the Meas Bar changes depending on the setting: – A line with an arrow is **Single** – A loop with an arrow is **Continuous**
Backwards Compatibility Notes	X-Series A-models had **Single** and **Cont** hardkeys in place of the **SweepSingleCont** softkey. In the X-Series A-models, if in single measurement, the **Cont** hardkey (and `INIT:CONT ON`) switched to continuous measurement, but never restarted a measurement and never reset a sweep X-Series B-models have a **Cont/Single** toggle control instead of **Single** and **Cont** hardkeys, but it is still true that, if in single measurement, the **Cont/Single** toggle control never restarts a measurement and never resets a sweep

More Information

Continuous Mode	The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the **Average/Hold Num**, the count stops incrementing, but the instrument keeps sweeping See the **Trace** key description under **Trace Average** for the averaging formula used both before and after the **Average/Hold Num** is reached. The trigger condition must be met prior to each sweep The type of trace processing for multiple sweeps is set under the **Trace** key, with choices of **Trace Average**, **Max Hold**, or **Min Hold**
Single Mode	The instrument takes a single sweep when in **Single** mode, or if in average or Max/Min Hold, or if there is a **Waterfall** window displayed, it takes multiple sweeps until the average/hold count reaches the **Average/Hold Num**, then the count stops incrementing, and the instrument stops sweeping See the **Trace** key description under **Trace Average** for the averaging formula used. The trigger condition must be met prior to the sweep The type of trace processing for multiple sweeps is set under the **Trace** key, with choices of **Trace Average**, **Max Hold**, or **Min Hold**

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

- `:INIT:CONT 1` has no effect
- `:INIT:CONT 0` places the instrument in Single Sweep but has no effect on the current sequence until k = N, at which point the current sequence will stop and the instrument will go to the idle state

See "Restart" on page 2279 for details of `:INIT:IMMediate`.

If the instrument is already in **Single** sweep, `:INIT:CONT OFF` has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending `:INIT:IMM` *does* reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending `:CALC:AVER:TCON UP`.

Restart

Restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending `:INIT:IMM`
- Sending `:INIT:REST`

See "More Information" on page 461

Remote Command	`:INITiate[:IMMediate]` `:INITiate:RESTart`
Example	`:INIT:IMM` `:INIT:REST`
Notes	`:INIT:REST` and `:INIT:IMM` perform exactly the same function
Couplings	Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The `STATus:OPERation` register bits 0 through 8 are cleared , *except* bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The `STATus:QUEStionable` register bit 9 (`INTegrity` sum) is cleared The `SWEEPING` bit is set The `MEASURING` bit is set
Backwards Compatibility Notes	For Spectrum Analysis Mode in ESA and PSA, the **Restart** hardkey and the `:INIT:REST` command restarted trace averages (displayed average count reset to 1) for a trace in **Clear Write**, but did not restart **Max Hold** and **Min Hold** In X-Series, the **Restart** hardkey and the `:INIT:REST` command restart not only **Trace Average**, but **MaxHold** and **MinHold** traces as well

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command `:CALC:AVER:TCON UP`.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

Event	Trace Effect
Clear/Write pressed (even if already in Clear/Write)	Set to mintracevalue
Max Hold pressed (even if already in Max Hold)	Set to mintracevalue
Min Hold pressed (even if already in Min Hold)	Set to maxtracevalue
Trace Average pressed (even if already in Trace Average)	Trace data unaffected but start new sweep/avg/hold
Restart pressed	Trace data unaffected but start new sweep/avg/hold
Parameter requiring restart changed (e.g., RBW)	Trace data unaffected but start new sweep/avg/hold

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is `k`. This `k` is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This `k` is used for comparisons with N, as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, `K`, shows the count for the sweep (data acquisition) in progress. `K` = `k` + 1, with a limit of N. The displayed value `K` changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** un-pauses the measurement. When paused, pressing **Restart** performs a Resume.

Remote Command	`:INITiate:PAUSe` `:INITiate:RESume`
Example	`:INIT:PAUS` `:INIT:RES`
Dependencies	Not displayed in Modes that do not support pausing
Annotation	Only on control

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORt` is sent, the alignment finishes *before* the abort function is performed, so `:ABORt` does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	`:ABORt`
Example	`:ABOR`

Notes	If :`INIT:CONT` is `ON`, then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met If :`INIT:CONT` is `OFF`, then `:INIT:IMM` is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met
Dependencies	For continuous measurement, `:ABORt` is equivalent to the **Restart** key Not all measurements support this command
Status Bits/OPC dependencies	The `STATus:OPERation` register bits 0 through 8 are cleared , *except* bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The `STATus:QUEStionable` register bit 9 (`INTegrity` sum) is cleared Since all the bits that feed into OPC are cleared by `:ABORt`, the Abort command will cause the `*OPC` query to return true

Sweep Time Annotation (Remote Query Only)

Returns the **Sweep Time Annotation** value. Available only on non-sweeping hardware.

This value is also displayed in the result trace window.

The value returned is the estimated turnaround time of each measurement cycle, in seconds. The turnaround time is the sum of the signal acquisition time, FFT time, and other overhead time, to complete the entire span of each measurement cycle.

Remote Command	`[:SENSe]:<meas>:SWEep:ETIMe?` `<meas>` is the identifier for the current measurement; any one of `CHPower-|ACPower|OBWidth|MONitor`
Example	Channel Power measurement `:CHP:SWE:ETIMe?`
Dependencies	Available only on non-sweeping hardware
Preset	Automatically calculated

3.3.9.2 Sweep Config

Accesses controls that let you configure the sweep and control functions of the instrument, such as "Sweep Time Rules" on page 464.

Sweep Time Rules

Switches the instrument between normal and accuracy sweep states:

Accy	`ACCuracy`
Norm	`NORMal`

Setting **Auto Sweep Time** to **Accy** results in slower sweep times, usually about three times as long, but yields better amplitude accuracy for CW signals. The instrument amplitude accuracy specifications only apply when **Auto Sweep Time** is set to **Accy**.

Additional amplitude errors which occur when **Auto Sweep Time** is set to **Norm** are usually well under 0.1 dB, though this is not guaranteed. Because of the faster sweep times and still low errors, **Norm** is the preferred setting of **Auto Sweep Time**. **Auto Sweep Time** is set to **Norm** on a **Preset**. This means that in the Preset state, instrument amplitude accuracy specifications do not apply.

Remote Command	`[:SENSe]:OBWidth:SWEep:TIME:AUTO:RULes NORMal | ACCuracy` `[:SENSe]:OBWidth:SWEep:TIME:AUTO:RULes?`
Example	`:OBW:SWE:TIME:AUTO:RUL NORM` `:OBW:SWE:TIME:AUTO:RUL?`
Dependencies	Does not appear in Spectrum Analyzer Mode in VXT model M9420A
Preset	`NORMal`
State Saved	Saved in instrument state
Range	`NORMal|ACCuracy`

Points

Sets the number of points taken per sweep, and displayed in the traces. The current value of points is displayed parenthetically, next to the sweep time in the lower-right corner of the display. Using more points provides greater resolution. Using fewer points compacts the data and decreases the time required to access a trace over the remote interface.

Increasing the number of points does not increase the sweep time. However, it can slightly impact the trace processing time and therefore the overall measurement speed. Decreasing the number of points does not decrease the sweep time, but it may speed up the measurement, depending on the other sweep settings (for example, in FFT sweeps). Fewer points will always speed up the I/O.

Due to minimum sweep rate limitations of the hardware, the minimum sweep time available to the user will increase above its normal value of 1 ms as the number of sweep points increases above 15001.

Changing the number of sweep points has several effects on the instrument. Since markers are read at the point location, the marker reading may change. The sweep time resolution will change. Trace data for all the traces will be cleared and, if **Sweep** is in **Cont**, a new trace taken. If any trace is in average or hold, the averaging starts over.

Due to sweep time quantization issues, the knob and up/down keys *cannot* be used to adjust the number of points.

When in a split-screen display, each window may have its own value for points.

When sweep **Points** is changed, an informational message "Sweep points changed, all traces cleared" is displayed, and in 5G NR Mode, **Auto Sweep Point**s is set to `OFF` (0).

Remote Command	`[:SENSe]:OBWidth:SWEep:POINts <integer>` `[:SENSe]:OBWidth:SWEep:POINts?`
Example	`:OBW:SWE:POIN 501` `:OBW:SWE:POIN?`
Dependencies	Not available when **Signal ID** is set to On in External Mixing Neither the knob nor the step keys can be used to change this value. If it is tried, a warning is given Not displayed in Modes that do not support Swept
Couplings	Whenever the number of sweep points change: – All trace data is erased – Any traces with **Update Off** will also go to **Display Off**Sweep time is re-quantized – Any limit lines that are on will be updated – If averaging/hold is on, averaging/hold starts over – **Auto Sweep Points** is set to `OFF` (5G NR Mode only) The resolution of setting the sweep time depends on the number of points selected
Preset	see table below

Preset:

Mode	Value
MSR, LTEAFDD, LTEATDD	2001
5GNR	Automatically calculated
All Others	1001

State Saved	Saved in instrument state
Min	101
Max	20001
Annotation	On second line of annotations, in lower right corner in parenthesis behind the sweep annotation

IF Dithering

Lets you turn IF Dithering on or off. This is a technique used in unpreselected instruments (such as Keysight’s modular instruments) to enhance the rejection of images and internally-generated spurious signals.

Remote Command	`[:SENSe]:SWEep:IF:DITHer OFF | ON | 0 | 1` `[:SENSe]:SWEep:IF:DITHer?`
Dependencies	Only appears in Spectrum Analyzer Mode in VXT models

Preset	`OFF`
State Saved	Saved in instrument state

Image Protection

Lets you turn IF Protection on or off. This is a technique used in unpreselected instruments (such as Keysight’s modular instruments) to detect and suppress images and spurs that may be present in non-preselected hardware.

IF Protection takes two sweeps and by correlating the data between them, provides a single, correct power-versus-frequency trace.

Remote Command	`[:SENSe]:SWEep:IMAGeprot OFF | ON | 0 | 1` `[:SENSe]:SWEep:IMAGeprot?`
Dependencies	Only appears in Spectrum Analyzer Mode in VXT models
Preset	`ON`
State Saved	Saved in instrument state

3.3.10 Trace

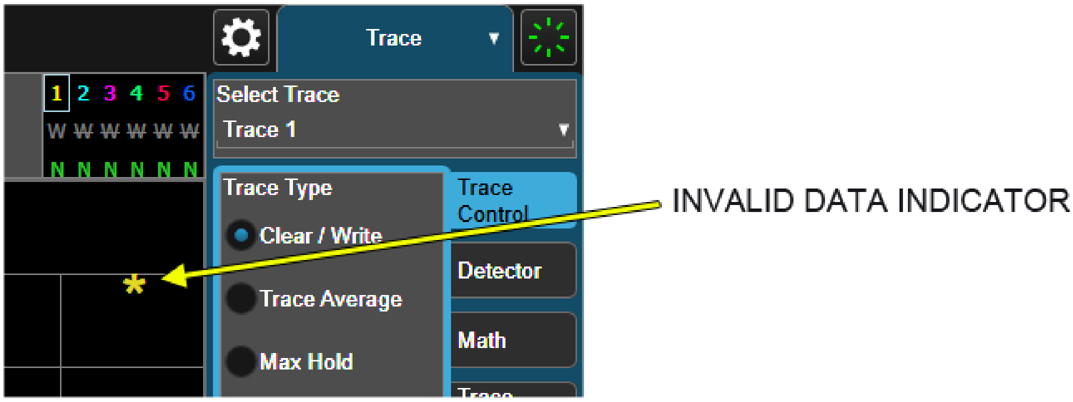
Lets you control the acquisition, display, storage, detection and manipulation of trace data for the available traces.

The "Trace Control" on page 2136 tab of this menu contains radio-button selections for the trace type (**Clear/Write, Trace Average, Max Hold, Min Hold**) and **View/Blank** setting for the selected trace.

A trace is a series of data points, each having an x and a y value. The x value is frequency (or time, in zero span) and the y value is amplitude. Each data point is referred to as a *trace point*. In any given trace, trace point 0 is the first point, and trace point (*sweep_points – 1*) is the last. For example, in a 1001 point trace, the first point is 0 and the last is 1000. Another term sometimes used to describe traces is *bucket*. A bucket is the frequency span of a trace point, equal to the point spacing. For swept analysis, the y value in each bucket is measured while the instrument is sweeping across the bucket. The selected detector determines how it is measured.

When in **Single** Mode, Measurements and their Views save the trace data from the last acquisition. This is true on multiple screens. The marker and trace data will be present whenever the measurement is brought back into focus. The measurement switches for these measurements do not clear the traces, so the data will be present until the next acquisition is completed.

Invalid Data Indicator



The Invalid Data Indicator is displayed whenever the data on the display does not match the settings of the instrument. The most common example of this is when instrument settings have changed in the time since the data in the traces on the display was taken. This means that the screen annotation cannot be guaranteed to match the trace data. For example, if you change **Center Frequency**, the Invalid Data Indicator will display until the trace has been retaken.

If any Trace is in View mode (displaying but not updating) and instrument settings are changed, the Invalid Data Indicator will display as long as that trace remains in View. Traces that are blanked do not turn on the Invalid Data Indicator.

Not all instrument settings require display of the invalid data indicator when they change; only changes that require a new acquisition will cause it to display. For example, changing the Y-Axis scale of the instrument does not cause the invalid data indicator to display, unless the attenuation changes.

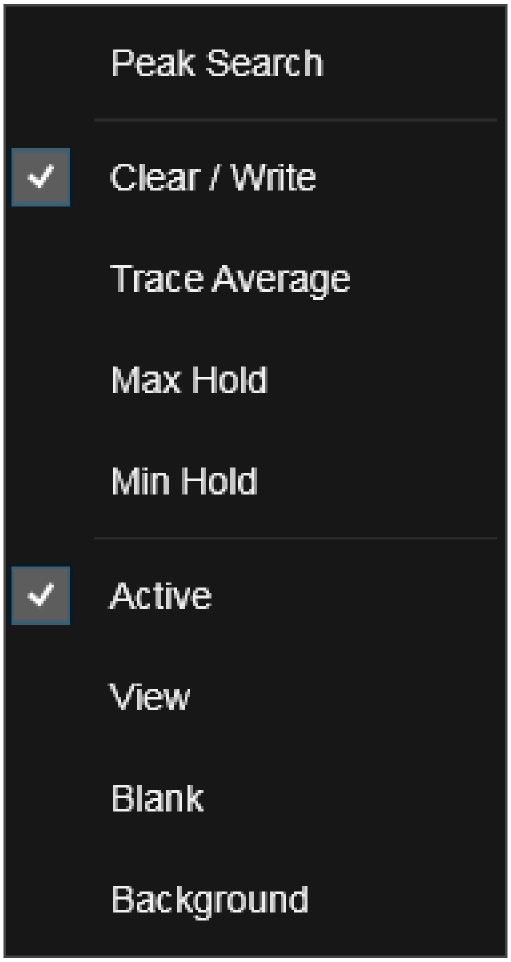
The Invalid Data Indicator is also turned on:

- When the counter is turned on, until the completion of the first count
- When a trace is imported from mass storage and the trace's parameters do not match the current instrument settings
- When a trace is sent to the instrument from a remote interface (since there is no way to know if its settings match)

NOTE **The Invalid Data Indicator has an associated status bit that can be checked at any time to determine whether the indicator is on.**

Trace right-click menu

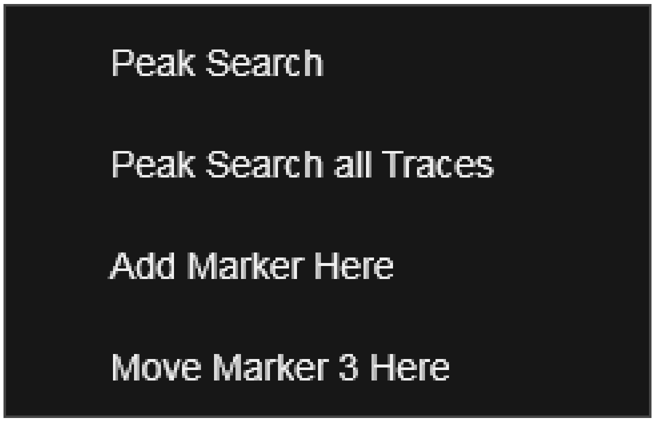
If you right-click on a trace (or touch and hold a trace and wait for the circle to close) you will see the Trace Right-Click Menu:



If you now tap or click on one of the items in this menu, the instrument will perform the corresponding function. **Peak Search** finds the highest peak on the selected Trace. **Clear/Write**, **Trace Average**, **Max Hold** and **Min Hold** set the "Trace Type" on page 2137. **Active**, **View**, **Blank**, and **Background** set the "View/Blank" on page 2142 type.

Waterfall Window

If you right-click on the trace (or touch and hold the trace and wait for the circle to close) in the **Waterfall** window (for example, in the Spectrogram View) you will see the Waterfall Trace Right-Click Menu:



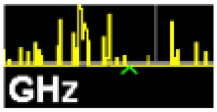
In this menu, **Peak Search** works as above. **Peak Search all Traces** finds the highest peak in the Waterfall window. **Add Marker Here** takes the lowest numbered Marker that is currently Off and turns it On as a **Normal** marker in the Waterfall window at the point where you right-clicked (or touched-and-held). **Move Marker n Here** moves the currently selected Marker to the point in the Waterfall window where you right-clicked (or touched-and-held).

Trace Update Indicator

Trace updates can take one of two forms:

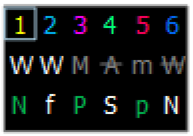
1. The trace is updated in a single operation that affects all of the points in the trace at once. This happens, for example, in the case of very fast (< 200 ms) sweeps, single-chunk FFT's, and the initial math operation after a math function is set for a trace
2. The trace is updated in a series of discrete steps, with measurement data being gathered between each step. This will be the case for slow sweeps, multi-chunk FFTs, gated sweeps, etc.

In the first case, no update indicator is required. In the second case, however, a visual indicator exists on the trace where the new data is being written. The indicator is a green caret (^) , which moves across the bottom of the graticule showing the current trace point.



Trace Annunciator Panel

This panel appears on the right hand side of the Meas Bar. Here is an explanation of the fields in this panel, as shown below:



Top Line

On the top line, each trace number is shown, in the trace color. A box is drawn around the currently selected trace.

Middle Line

Below each trace number, is a letter signifying the trace type for that trace number, where

`W`	Clear/Write
`A`	Trace Average
`M`	Max Hold
`m`	Min Hold

If the letter is white, it means the trace is being updated (**Update** = `ON`); if the letter is dimmed , it means the trace is not being updated (**Update** = `OFF`). A strikethrough indicates that the trace is blanked (**Display** = `OFF`). Note that it is possible for a trace to be updating *and* blanked, which is useful if the trace is a trace math component.

Bottom Line

The third line shows the detector type for each trace, or, if trace math is on for that trace, it shows “f” (for “math function”). It is not always possible to have a unique detector for each trace, but the instrument hardware provides the maximum flexibility of detector selection in order to maintain the highest accuracy. The letters used for this readout are

`N`	Normal
`A`	Average
`P`	peak
`p`	negative peak
`S`	Sample
`Q`	Quasi Peak
`E`	EMI Average
`R`	RMS Average
`f`	math function

If the letter is green, the detector is in Auto. If white, the detector has been manually selected.

In the example above, the panel is indicating the following:

- Trace 1: Visible, being updated, in Clear/Write, with Normal detector auto selected
- Trace 2: Visible, being updated, in Clear/Write, being written to with a math function
- Trace 3: Visible, not updating, data was taken in Max Hold, with the peak detector auto selected
- Trace 4: Blanked, not updating, data was taken with Averaging turned on, Sample detector manually selected
- Trace 5: Visible, not updating, data was taken in Min Hold with Negative Peak detector auto selected
- Trace 6: Blanked, not updating, in Clear/Write, with Normal detector manually selected

Trace Annotation

When **Trace Annotation** (see **Display**) is `ON`, each non-blanked trace is labeled on the trace with the detector used to take it, unless a Trace Math function is on for that trace, in which case it is labeled with the "Math Function" on page 1145.

The detector labels are:

`NORM`	Normal
`PEAK`	Peak
`SAMP`	Sample
`NPEAK`	Negative Peak
`RMS`	Average detector with Power Average (RMS)
`LG AVG`	Average detector with Log-Pwr Average
`VAVG`	Average detector with Voltage Average
`QPEAK`	Quasi Peak
`EMI AVG`	EMI Average
`RMS AVG`	RMS Average

The trace math labels are:

`PDIF`	Power Difference
`PSUM`	Power Sum
`LOFF`	Log Offset
`LDIF`	Log Difference

3.3.10.1 Select Trace

Specifies the *selected trace*, which is the trace that will be affected when you change trace settings.

Select Trace appears above the menu panel, indicating that it applies to *all* controls in the menu panel. **Select Trace** is blanked if you select a tab whose controls do *not* depend on the selected trace (for example, **Trace Function**).

Notes	The selected trace is remembered even when not in the **Trace** menu
Dependencies	For the Swept SA measurement: – In Image Suppress mode, when you select a trace it becomes the active trace, and the formerly active trace goes into View – When you turn on Image Suppress, Update turns off for all traces except the selected trace For the ACP measurement, when **Meas Method** is `RBW`, `FAST` or `FPOWer`, **Select Trace** is disabled
Preset	Trace 1
State Saved	Yes

3.3.10.2 Trace Control

The controls on this tab allow you to set the "Trace Type" on page 2137 and its update mode.

There are four Trace Types:

- **Clear/Write**
- **Trace Average**
- **Max Hold**
- **Min Hold**

Each type handles data in a different way.

Each trace also has two values that determine whether it is being written or not, and whether it is being displayed or not. These values, **Update** and **Display,** are described fully in the "View/Blank" on page 2142 control description. Essentially, when **Update** is `ON`, a trace is updating, and when **Update** is `OFF` it is not. When **Display** is `ON`, it is visible and when **Display** is `OFF` it is not. These terms are used throughout the descriptions in this section.

Trace Type

There are four trace Types:

Option	Parameter	SCPI Example	Details
Clear/Write	`WRITe`	`:TRAC2:TYPE WRIT`	See: "Clear/Write" on page 477
Trace Average	`AVERage`	`:TRAC2:TYPE AVER`	See: "Trace Average" on page 477
Maximum Hold	`MAXHold`	`:TRAC3:TYPE MAXH`	See: "Max Hold" on page 478
Minimum Hold	`MINHold`	`:TRAC5:TYPE MINH`	See: "Min Hold" on page 478

Full descriptions of each type are provided below. You may select one of these types for each trace. Re-selecting the current **Trace Type** initiates the same action that selecting it the first time did, even though it is already selected. For example, selecting **Clear/Write** while **Clear/Write** is already selected will nonetheless clear the trace and begin rewriting it.

Besides the **Trace Type**, the "View/Blank" on page 2142 state must be set to **Active** (**Update**: `ON`, **Display**: `ON`) for a trace to be updating and visible. Selecting any **Trace Type** automatically makes the trace **Active**.

See also: "Trace Mode Backwards Compatibility Commands" on page 475

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe[1]|2|…|6:TYPE WRITe | AVERage | MAXHold | MINHold`
	`:TRACe[1]|2|…|6:TYPE?`
	For all other measurements:
	`:TRACe[1]|2|3:<meas>:TYPE WRITe | AVERage | MAXHold | MINHold`
	`:TRACe[1]|2|3:<meas>:TYPE?`
	where `<meas>` is the identifier for the current measurement

Example	`:TRAC:TYPE WRIT` `:TRAC:TYPE?`
Couplings	Selecting a **Trace Type** (by pressing any of the Trace Type selections or sending `:TRAC:TYPE`) sets the Trace to **Active** (**Update**: `ON`, **Display**: `OFF`), even if the same trace type was already selected When Detector setting is “Auto” (`[:SENSe]:<meas>:DETector:AUTO?`), Detector (`[:SENSe]:<meas>:DETector[:FUNCtion]?`) switches aligning with the switch of this parameter: “`NORMal`” with `WRITe` (Clear Write), “`AVERage`” with `AVERage`, “`POSitive` (peak)” with `MAXHold`, and “`NEGative` (peak)” with `MINHold`
Preset	Swept SA and Monitor Spectrum: `WRITe` All other measurements: `AVERage` Following **Preset**, all traces are cleared (all trace points set to mintracevalue)
State Saved	The type of each trace is saved in instrument state
Annunciation	The type for each trace is indicated in the Trace annunciator panel on the Measurement Bar

Trace Mode Backwards Compatibility Commands

In earlier instruments, the “Trace Modes” were: Clear/Write, Max Hold, Min Hold, View and Blank. Averaging was global to all traces and was controlled under the **BW/Avg** menu.

In X-Series, trace averaging can be done on a per-trace basis. The Trace Modes (now called Trace Types) are Clear/Write, Trace Average, Max Hold and Min Hold. View and Blank are set separately under "View/Blank" on page 2142.

While this provides more flexibility, it also gives rise to potential backwards compatibility problems. To mitigate these, the old Trace Mode command has been retained and a new Trace Type command has been added. The :`TRACe:MODE` command is retained for backwards compatibility, and the :`TRACe:TYPE`, :`TRACe:UPDate` and :`TRACe:DISPlay` commands introduced for ongoing use. The old Trace Modes are selected using `:TRAC:MODE`, whose parameters are mapped into calls to `:TRACe:TYPE`, `:TRACe:UPDate` and `:TRACe:DISPlay`, and the old global Averaging command `[:SENSe]:AVERage[:STATe]` is provided for backwards compatibility. See the individual command descriptions for details.

When **Average/Hold** in the **Meas Setup**, **Legacy Compatibility** menu is `ON`, the following is true for traces in Max Hold and Min Hold:

- They ignore the **Average/Hold** number; **Single** for Max Hold causes one sweep only, so switching to **Single** stops after the current sweep, and switching to **Cont** starts again without clearing the accumulated result
- Max Hold is not cleared on a **Restart**, **Single** or `:INIT:IMM`, but changing a measurement parameter, like frequency or bandwidth etc., still restarts the Max Hold

Preset	`WRITe`
State Saved	The trace mode is an alias only
Backwards Compatibility SCPI	`:TRACe[1]|2|…|6:MODE WRITe | MAXHold | MINHold | VIEW | BLANk` `:TRACe[1]|2|…|6:MODE?`
Backwards Compatibility Notes	The legacy `:TRACe:MODE` command is retained for backwards compatibility. In conjunction with the legacy `:AVErage` command, it works as follows: – `:AVErage ON|OFF` sets/clears a variable that we will call average for the sake of this discussion. This variable is maintained by the instrument solely for backwards compatibility. See the `[:SENSe]:AVERage[:STATe]` command description below – `:TRACe:MODE WRITe` sets `:TRACe:TYPE WRITe` (Clear/Write) unless average is true, in which case it sets it to `:TRACe:TYPE AVErag`e. It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace – `:TRACe:MODE MAXHold` sets `:TRACe:TYPE MAXHold` (Max Hold). It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace

- `:TRACe:MODE MINHold` sets `:TRACe:TYPE MINHold` (Min Hold). It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace
- `:TRACe:MODE VIEW` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay ON`, for the selected trace
- `:TRACe:MODE BLANk` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay OFF`, for the selected trace

The query returns the same value as `:TRACe:TYPE?`, meaning that if you set `:TRACe:MODE:VIEW` or `:TRACe:MODE:BLANk`, the query response will not be what you sent

`:TRACe[n]:MODE` was formerly used to set the type or "writing mode" of the trace. At that time, View and Blank were writing modes. The new `:TRACe:TYPE` command should be used in the future, but `:TRACe:MODE` is retained to provide backwards compatibility

In X-Series, unlike earlier instruments, Max Hold and Min Hold now obey the Average Number and counts up to a terminal value as Average always has

As the **Average/Hold Number** now affects **Min Hold** and **Max Hold**, the operations that restart Averaging (for example, the **Restart** key) now also restart **Min Hold** and **Max Hold**

As a result of these changes, legacy code that restarts averaging while retaining a running Max Hold will need to be rewritten, because the Max Hold will now restart when the Average does

Also, previous to X-Series:

- Pressing **Max Hold** while already in **Max Hold** (or doing so remotely) had no effect. Now it will clear the trace and restart the sweep and the Max Hold sequence
- Changing the vertical scale (Log/Lin or dB/div) of the display restarted **Max Hold** and **Min Hold**. This is no longer the case

Preset	`OFF`
State Saved	The state of Average is saved in Instrument State for ghosting purposes
Backwards Compatibility SCPI	`[:SENSe]:AVERage[:STATe] ON | OFF | 1 | 0` `[:SENSe]:AVERage[:STATe]?`
Backwards Compatibility Notes	Previous to X-Series, Averaging (also sometimes known as trace averaging) was global to all traces, that is, it was either on or off for all active traces. The legacy command `[:SENSe]:AVERage[:STATe] ON|OFF|1|0` was used to turn Averaging on or off In X-Series, Averaging is turned on or off on a per-trace basis, so it can be on for one trace and off for another For backwards compatibility, the old global Average State variable is retained solely as a legacy variable, turned on and off and queried by the legacy command `[:SENSe]:AVERage[:STATe] OFF|ON|0|1.` When Average is turned on, any trace in Clear/Write will get put into Average. While Average is on, any trace put into Clear/Write by the old `:TRAC:MODE` command will instead get put into Average. When Average is turned off, any trace in Average will get put into Clear/Write

Trace Type Details

Clear/Write

Each trace update replaces the old data in the trace with new data.

Pressing **Clear/Write** for the selected trace, or sending `:TRAC:TYPE WRIT` for the specified trace, sets the trace type to **Clear/Write** and clears the trace, even if you are already in **Clear/Write**. Then a new sweep is initiated. Trigger conditions must be met before the sweep actually starts, and if in **Single** the sweep won't start until **Restart** is pressed.

Pressing **Clear/Write** stops the current sweep and initiates a new one, so **Trace Average, Max Hold** and **Min Hold** data may be interrupted in mid-sweep when **Clear/Write** is pressed, and therefore may not accurately reflect the displayed count. Therefore, when **Clear/Write** is pressed for one trace, **Trace Average, Max Hold** and **Min Hold** must restart for all traces.

When in **Clear/Write**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), a new sweep is initiated but the trace is not cleared.

Trace Average

The instrument maintains and displays an average trace, which represents the cumulative average on a point-by-point basis of the new trace data and previous averaged trace data.

Pressing **Trace Average** (for the selected trace), or sending `:TRAC:TYPE AVER` (for the specified trace), sets the trace type to **Trace Average**, clears the trace, initiates a new sweep, and restarts the Average sequence.

Details of the count limiting behavior and the averaging calculations may be found under **Avg|Hold Number** and **Average Type** under **Meas Setup.**

When in **Trace Average**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like Center Frequency or Attenuation), the average restarts and a new sweep is initiated but the trace is not cleared.

Restarting the average means:

- The average/hold count k is set to 1, so that the next time the average trace is displayed it simply represents one trace of new data
- A new sweep is initiated

- Once the new sweep starts, the trace is overwritten with current trace data as the first trace of the new average

Remember that restarting averaging also restarts **Max Hold** and **Min Hold**, as there is only one count for Trace Average and Hold.

Max Hold

The instrument maintains and displays a max hold trace, which represents the maximum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under **Meas Setup.**

Pressing **Max Hold** for the selected trace, or sending `:TRAC:TYPE MAXH` for the specified trace, sets the Trace Type to **Max Hold,** clears the trace , initiates a new sweep, and restarts the hold sequence, even if you are already in **Max Hold**.

When in **Max Hold**, if a measurement-related instrument setting is changed(that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Max Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Max Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the max hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated.

Remember that restarting **Max Hold** also restarts averaging and **Min Hold**, as there is only one count for Trace Average and Hold.

Min Hold

The instrument maintains and displays a min hold trace, which represents the minimum data value on a point-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under the **Meas Setup** functions.

Pressing **Min Hold** for the selected trace, or sending `:TRAC:TYPE MINH` for the specified trace, sets the Trace Type to **Min Hold,** clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Min Hold**.

When in **Min Hold**, if a measurement-related instrument setting is changed(that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Min Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Min Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the min hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated

Remember that restarting **Min Hold** also restarts **Max Hold** and averaging, because there is only one count for Trace Average and Hold.

Clear and Write | Restart Averaging | Restart Max/Min Hold

Starts the trace writing, as though the "Trace Type" on page 2137 had just been selected. The effect is exactly the same as reselecting the current **Trace Type** again – the control is provided because it may not be obvious that reselecting the same selection from a radio button menu will take any action.

This control displays different labels, depending on the selected Trace Type:

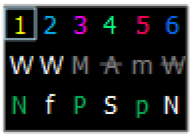
- **Clear/Write**: Clear and Write
- **Trace Average**: Restart Averaging
- **Max Hold**: Restart Max Hold
- **Min Hold**: Restart Min Hold

View/Blank

Lets you set the state of the two trace variables: **Update** and **Display**. The choices available in this dropdown menu are:

Active	Update and Display both ON
View	Update OFF; Display ON
Blank	Update OFF; Display OFF
Background	Update ON, Display OFF Allows a trace to be blanked *and* continue to update "in the background", which was not possible in the past

In the Swept SA measurement, a trace with **Display**OFF is indicated by a strikethrough of the type letter in the trace annotation panel in the Measurement Bar. A trace with **Update**OFF is indicated by dimming the type letter in the trace annotation panel in the Measurement Bar. In the example below, Traces 3, 4, 5 and 6 have **Update**OFF, and Traces 4 and 6 have **Display**OFF.



See: "More Information" on page 481

Notes	For the commands to control the two variables, Update and Display, see "Trace Update State On/Off" on page 480 and "Trace Display State On/Off" on page 480 below
Dependencies	When Signal ID is on, this key is grayed-out
Couplings	Selecting a Trace Type for a trace (pressing the key or sending the equivalent command) puts the trace in **Active** (Update `ON` and Display `ON`), even if that trace type was already selected Selecting a detector for a trace (pressing the key or sending `[:SENS]:DET:TRAC`) puts the trace in **Active** (**Update**`ON` and **Display**`ON`), even if that detector was already selected Selecting a "Math Function" on page 1145 other than `OFF` for a trace (pressing the key or sending the equivalent command) puts the trace in **Active** (**Update**`ON` and **Display**`ON`), even if that Math Mode was already selected Loading a trace from a file puts that trace in **View** regardless of the state it was in when it was saved; as does being the target of a **Copy** or a participant in an **Exchange**

Trace Update State On/Off

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe[1]|2|…|6:UPDate[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|…|6:UPDate[:STATe]?`
	For all other measurements:
	`:TRACe[1]|2|3:<meas>:UPDate[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|3:<meas>:UPDate[:STATe]?`
	where <meas> is the identifier for the current measurement

Example	Make trace 2 inactive (stop updating): `:TRAC2:UPD 0`
Couplings	Whenever you set **Update** to `ON` for any trace**,** the **Display** is set to `ON` for that trace

Preset	For Swept SA Measurement (in SA Mode):
	`1|0|0|0|0|0`
	`ON` for Trace 1; `OFF` for 2–6
	For all other measurements:
	`1|0|0`
	`ON` for Trace 1; `OFF` for 2 &3

State Saved	Saved in instrument state

Trace Display State On/Off

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe[1]|2|…|6:DISPlay[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|…|6:DISPlay[:STATe]?`
	For all other measurements:

	`:TRACe[1]|2|3:<meas>:DISPlay[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|3:<meas>:DISPlay[:STATe]?`
	where <meas> is the identifier for the current measurement

Example	Make trace 1 visible:
	`:TRAC2:DISP 1`
	Blank trace 3:
	`:TRAC3:DISP 3`

Couplings	Whenever you set **Update** to `ON` for any trace, the **Display** is set to `ON` for that trace

Preset	For Swept SA Measurement (in SA Mode):
	`1|0|0|0|0|0`
	`ON` for Trace 1; `OFF` for 2–6
	For all other measurements:
	`1|0|0`
	`ON` for Trace 1; `OFF` for 2 &3

State Saved	Saved in instrument state

More Information

When a trace becomes inactive, any update from the `:SENSe` system (detectors) immediately stops, without waiting for the end of the sweep. The trace data remains unchanged, but stops updating. If the trace is blanked, this still does not affect the data in the trace. Traces that are blanked (**Display**=`OFF`) do not display nor appear on printouts, but their data stays intact, they may be queried, and markers may be placed on them

In most cases, inactive traces are static and unchanging; however, there are cases when an inactive trace will update, specifically:

- if data is written to that trace from remote
- if trace data is loaded from mass storage
- if the trace is the target of a **Copy** or participant in an **Exchange**
- if the trace is cleared using **Clear Trace**

Inactive traces that are also being displayed (traces in **View**) are displayed at half intensity. Traces in **View** display across the entire X-Axis of the instrument. Their horizontal placement does not change, even if X-Axis settings subsequently are changed, although Y-Axis settings do affect the vertical placement of data.

When a trace becomes active (**Update**=`ON`), the trace is cleared, the average count is reset, and a new sweep is initiated.

Note that putting a trace into **Display**=`OFF` and/or **Update**=`OFF` does *not* restart the sweep and does *not* restart Averaging or Hold functions for any traces.

3.3.10.3 Math

Lets you turn on and configure Trace Math functions.

Math Function

Trace Math functions perform mathematical operations between traces and, in some cases, user-specified offsets. When in a Trace Math function, the indicated function is performed during the sweep with the math function used in place of a detector. The trace operands for the math function are set using the "Operand 1 / Operand 2" on page 1151 controls.

- See "How trace math is processed" on page 486

Remote Command	For option details, see "Trace Math Options" on page 484
	For Swept SA Measurement (in SA Mode):
	`:CALCulate:MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>`
	`:CALCulate:MATH? <trace_num>`
	where `<trace_num>` is any one of:
	`TRACE1|…|TRACE6`
	For all other measurements:
	`:CALCulate:<meas>:MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>`
	`:CALCulate[:<meas>]:MATH? <trace_num>`
	where:
	`<meas>` is the identifier for the current measurement, and
	`<trace_num>` is any one of:
	`TRACe1|TRACe2|TRACe3`
	Note that the format of the `TRACe<n>` parameter differs from that for the Swept SA Measurement

Example	`:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0`
	Sets Trace 3 to Power Diff trace math function, and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2
	`:CALC:MATH TRACE3,PSUM,TRACE1,TRACE2,0,0`
	Sets Trace 3 to Power Sum trace math function and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2
	`:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`

	Sets Trace 3 to Log Offset trace math function, sets the First Trace operand (for Trace 3) to Trace 1, leaves the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and sets the Log Offset (for Trace 3) to -6 dB
	`:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00`
	Sets Trace 3 to Log Diff trace math function, sets the First Trace operand (for Trace 3) to Trace 1, sets the Second Trace operand (for Trace 3) to Trace 2, and sets the Log Difference reference (for Trace 3) to -6 dBm
	`:CALC:MATH TRACE1,OFF,TRACE2,TRACE3,0,0`
	Turns off trace math for trace 1

Notes	The Trace Math Function command has 6 main set of parameters:
	- Set 1 defines the “result trace”:
	`TRACE1|…|TRACE6`
	-Set 2 defines the “function”:
	`PDIFference|PSUM|LOFFset|LDIFference|OFF`
	- Set 3 is a “trace operand” (1):
	`TRACE1|…|TRACE6`
	- Set 4 is a “trace operand” (2):
	`TRACE1|…|TRACE6`
	- Set 5 defines the “Log Offset” (in dB)
	- Set 6 defines the “Log Difference Reference” (in dBm)
	Note that the trace math mode is an enumeration; that is, when a math function is set for a trace, it turns off any math function that is on for that trace, then sets the new math function
	The parameters sent in the command are reflected in the values in the control menu. There is no default for any parameter; all 6 parameters must be sent to satisfy the parser. Failure to specify a parameter will result in a missing parameter message
	The query returns the math mode, the operand traces, the offset and the reference for the specified trace, all separated by commas

Dependencies	Trace Math is not available if **Normalize** is on Trace Math is not available if Signal ID is on None of the trace operands can be the destination trace. If any of the three trace math commands is sent with a destination trace number matching one of the operands, a warning is generated and the function does not turn on
Couplings	When a math function is changed for a trace, that trace is set to Display = `ON`; and Update = `ON`

Preset	For Swept SA Measurement (in SA Mode):
	`OFF,TRACE5,TRACE6,0,0 | OFF,TRACE6,TRACE1,0,0 | OFF,TRACE1,TRACE2,0,0 | OFF,TRACE2,TRACE3,0,0 | OFF,TRACE3,TRACE4,0,0 | OFF,TRACE4,TRACE5,0,0`
	For all other measurements:
	`OFF,TRACE2,TRACE3,0,0 | OFF,TRACE3,TRACE1,0,0 | OFF,TRACE1,TRACE2,0,0`

State Saved	The trace math function for each trace is saved in instrument state
Annunciation	An “f” is shown on the trace annunciation panel in the Measurement Bar when a math function is on;

	and the function is annotated on the trace if Trace Annotation is on
Status Bits/OPC dependencies	`*OPC` can be used to detect the completion of a sweep, which will also correspond to the completion of the math operation, since all math takes place during the sweep

Trace Math Options

IMPORTANT

To generate a trace math result, *you must take a sweep*. The trace math engine, described below, operates in concert with the sweep engine in the instrument. Until a sweep has been taken, even if the constituent traces are not in Update mode, no result is generated.

Note that certain events can affect the trace in ways that affects all points at once. This can happen in any number of ways, including:

- A trace clear taking place
- A trace being loaded from the file system
- Trace data being sent in from the remote interface
- A copy or exchange of trace data

You should try to avoid these occurrences during a sweep, as they will tend to invalidate the math result being accumulated.

The Trace Math functions are:

Power Diff (Op1 - Op2)

Calculates a power difference between the `First Trace` operand and the `Second Trace` operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace:

`DestinationTrace = 10 log(10(1/10)(FirstTrace) – 10(1/10)(SecondTrace))`

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in `FirstTrace` is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

Otherwise, if the result of the subtraction is less than or equal to 0, the resultant point is `mintracevalue`.

Power Sum (Op1 + Op2)

Calculates a power sum between the `First Trace` operand and the `Second Trace` operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

```
DestinationTrace = 10 log(10(1/10)(FirstTrace) + 10(1/10)(SecondTrace))
```

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in either trace operand is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

Log Offset (Op1 + Offset)

Calculates a log offset from the `First Trace` operand and puts the result in the destination trace. This is like the B-DL function in some older instruments. The offset is entered on the `Offset` control, which only appears when this math function is in force for the selected trace. Each destination trace has its own offset.

During the sweep, the following formula is executed for each point in the trace operand, and the corresponding point is generated for the destination trace.

```
DestinationTrace = FirstTrace + Offset
```

The values of the trace points are assumed to be in dBm (as they are internally stored) and the offset is in dB.

If a point in the trace operand is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

If a point in the trace operand is equal to `mintracevalue`, the resultant point is also `mintracevalue`.

Example: If offset is 25 dB, then our destination trace will be higher than the operand trace by 25 dB.

Note that the `Second Trace` operand is not used for this function.

Log Diff (Op1 - Op2 + Ref)

Offsets the difference between the `First Trace` operand and the `Second Trace` operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

Offsets the difference between the `First Trace` operand and the `Second Trace` operand by a reference and puts the result in the destination trace. This is like the A-

B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

```
DestinationTrace = (FirstTrace - SecondTrace) + Reference
```

The values of the operand trace points are assumed to be in decibel units (as they are internally stored) and the reference is in dBm so the result is in dBm.

Example: If the first operand trace 1 is at 5 dBm, the second operand trace 2 is at –5 dBm, and the reference is –25 dBm, then the destination trace will be –15 dBm.

Example: If the first operand trace1 is at 60 dBuV, the second operand trace 2 is at 50 dBuV, and the reference is 35 dBuV, then the destination trace will be 45 dBuV.

If a point in `FirstTrace` is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

If a point in `FirstTrace` is equal to `mintracevalue`, the resultant point is also `mintracevalue`.

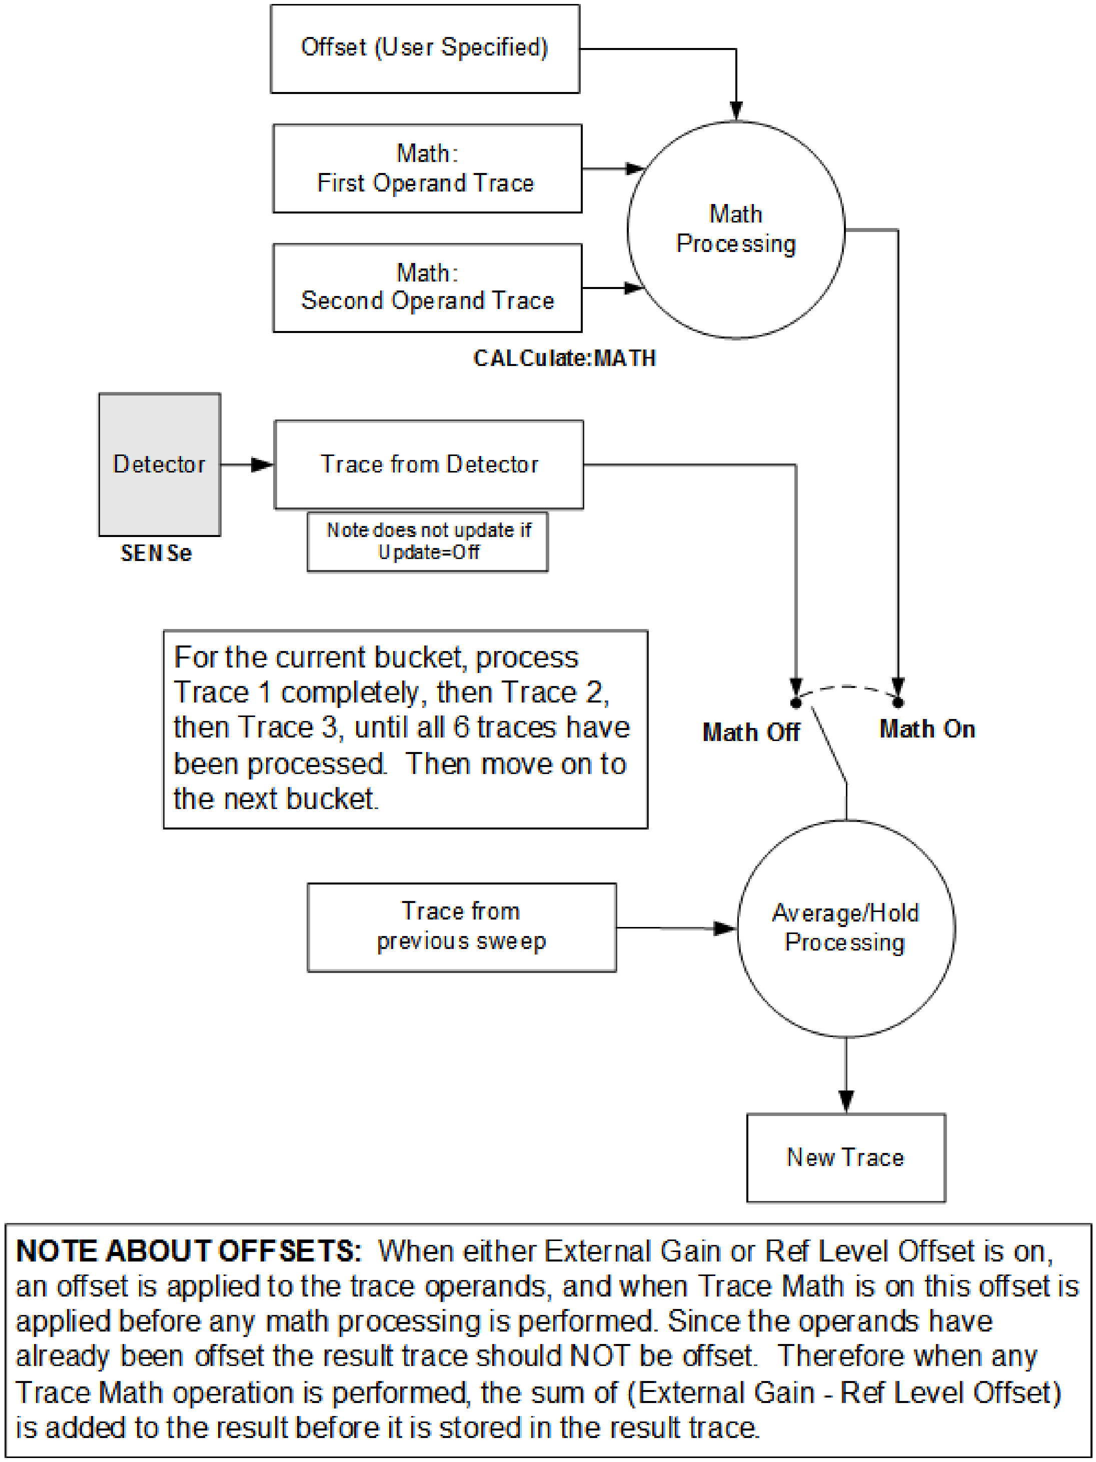
If neither of the above is true for a given point, then:

- If that point in `SecondTrace` is equal to `maxtracevalue`, the resultant point is `mintracevalue`.
- If that point in `SecondTrace` is equal to `mintracevalue`, the resultant point is `maxtracevalue`.

How trace math is processed

Whenever a trace math function is turned on, or the parameters and/or operands of an existing trace math function are changed, the destination trace is cleared. After the trace is cleared, all x-axis values in the trace, and the domain of the trace, are set to match the X-Axis settings of the first trace operand. When this is complete, a new sweep is initiated.

The process of acquiring data, processing it using the math and Average/Hold functions, and presenting it as trace data, consists of several functional blocks, as shown below:



For the current bucket, process Trace 1 completely, then Trace 2, then Trace 3, until all 6 traces have been processed. Then move on to the next bucket.

NOTE ABOUT OFFSETS: When either External Gain or Ref Level Offset is on, an offset is applied to the trace operands, and when Trace Math is on this offset is applied before any math processing is performed. Since the operands have already been offset the result trace should NOT be offset. Therefore when any Trace Math operation is performed, the sum of (External Gain - Ref Level Offset) is added to the result before it is stored in the result trace.

For each active trace, the current trace point is processed for `Trace 1`, then `Trace 2`, then `Trace 3`, etc. Trace data is taken from either the detector for that trace, or

from the mathematical result of up to two other traces and an offset, depending on whether trace math is on or not. The resultant data is then fed to the Average/Hold processing block, where (if the trace type is **Average**, **Max Hold**, or **Min Hold**) it is processed with previous trace data. The new trace data resulting from this process is then available for display, storage or remote output.

When the processing is complete for `Trace 1`, `Trace 2` is processed, and so on until all six traces have been processed. This allows a downstream trace to use as one of its math components a fully processed upstream trace. In other words, if math is `ON` for `Trace 4`, and its operand traces are `Trace 2` and `Trace 3`, then all detector, math, average and hold processing for Traces 2 and 3 is completed before the math is performed for `Trace 4`. When the current trace point is completed for all traces, the instrument moves on to the next trace point.

This allows very flexible and powerful math functions to be configured. For example, `Trace 1` can be an average trace, which can be fed with an offset to `Trace 2`, which can also be in **Max Hold**, allowing you to obtain the **Max Hold** of an Average trace.

Note that none of this processing is performed on inactive traces.

Note also that for any active trace with math `ON`, the Operand traces should have *lower* numbers than the trace (for example, using `Trace 4` as an operand for `Trace 1` will cause the data coming from `Trace 4` to be delayed by one sweep).

Operand 1 / Operand 2

These two controls select the first and second trace operands to be used for the trace math functions for the destination trace. The operands are common to all math functions for a given trace. The most recently sent `:CALCulate:MATH` command for a given trace sets the operands for that trace. Those settings are displayed on the trace operand controls for that trace.

Example	The following examples are for the Swept SA measurement
	Set Trace 3 to Power Diff trace math function. Set the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2:
	`:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0`
	Set Trace 3 to Log Offset trace math function. Set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB:
	`:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`

Notes	See "Math Function" on page 1145 for how to specify Operands 1 and 2 using `:CALCulate:MATH`
Dependencies	The destination trace cannot be an operand. The destination trace number is grayed-out on the dropdown
Preset	Operand 1: Trace number minus 2 (wraps at 1). For example, for Trace 1, Operand 1 presets to Trace

	5; for Trace 6, it presets to Trace 4 Operand 2: Trace number minus 1 (wraps at 1). For example, for Trace 1, Operand 2 presets to Trace 6; for Trace 6, it presets to Trace 5
State Saved	Operands 1 and 2 for each trace are stored in instrument state

Offset

Used by the Log Offset math function.

Example	The following example is for the Swept SA measurement Set Trace 3 to Log Offset trace math function, set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB: `:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`
State Saved	The Log Offset value for each trace is saved in Instrument State
Min	–100 dB
Max	100 dB

Reference

Used by the Log Diff math function.

Example	The following example is for the Swept SA measurement Set Trace 3 to Log Diff trace math function, set the First Trace operand (for Trace 3) to Trace 1, set the Second Trace operand (for Trace 3) to Trace 2, and set the Log Difference reference (for Trace 3) to -6 dBm: `:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00`
State Saved	The Log Difference reference value for each trace is saved in instrument state
Min/Max	Same as reference level

3.3.10.4 Detector

Lets you select and configure detectors for the specified trace.

Detector

Selects a detector to be used by the instrument for the current measurement. The following selections are available:

Option	Behavior
AUTO	The detector selected depends on marker functions, trace functions, average type,

Option	Behavior
	and the trace averaging function For details, see "Detector Select Auto/Man" on page 491
`NORMal`	The detector determines the peak of the CW-like signals, and it yields alternating maximums and minimums of noise-like signals. This is also referred to as Rosenfell detection
`AVERage`	The detector determines the average of the signal within the sweep points, using RMS averaging
`POSitive` Peak	The detector determines the maximum of the signal within the sweep points
`SAMPle`	The detector indicates the instantaneous level of the signal at the center of the sweep points represented by each display point
`NEGative` Peak	The detector determines the minimum of the signal within the sweep points
`RMS`	Equivalent to `AVERage`

Because they may not find a spectral component's true peak, neither `AVERage` nor `SAMPle` detectors measure amplitudes of CW signals as accurately as `POSitive`Peak or `NORMal`, but they do measure noise without the biases of peak detection.

Remote Command	`[:SENSe]:OBWidth:DETector[:FUNCtion] NORMal | AVERage | POSitive | SAMPle | NEGative | RMS` `[:SENSe]:OBWidth:DETector[:FUNCtion]?`

Example	`:OBW:DET NORM`
	`:OBW:DET?`
	Set the detector to **Average**. **Average** uses RMS averaging, so this is equivalent to selecting an `RMS` detector:
	`:OBW:DET RMS`

Notes	The query returns a name that corresponds to the detector type, as follows The `RMS` selection sets the detector type to `AVERage`, with RMS averaging. Therefore, if `RMS` had been selected, the query returns `AVER`

String Returned	Definition
`NORM`	Normal
`AVER`	Average (RMS)
`POS`	Peak
`SAMP`	Sample
`NEG`	Negative Peak

Couplings	When "Detector Select Auto/Man" on page 491 is `ON`, the values returned by the query depend on the setting of "Trace Type" on page 2137 as follows:

Trace Type	Query Returns:
`WRITe`	`NORMal`
`AVERage`	`AVERage`
`MAXHold`	`POSitive`
`MINHold`	`NEGative`

Preset	`AVERage`
State Saved	Saved in instrument state
Range	`NORMal|AVERage|POSitive|SAMPle|NEGative|RMS`

Detector Select Auto/Man

Sets the Detector mode to **Auto** (`ON`) or **Man** (`OFF`). In **Auto**, the proper detector is chosen based on rules that take into account the measurement settings and other instrument settings.

When you select any "Detector" on page 489 manually, this setting reverts automatically to **Man** (manual).

Remote Command	`[:SENSe]:OBWidth:DETector:AUTO ON | OFF | 1 | 0` `[:SENSe]:OBWidth:DETector:AUTO?`
Example	`:OBW:DET:AUTO ON` `:OBW:DET:AUTO?`
Couplings	When `ON`, the query "Detector" on page 489 returns values that depend on the setting of "Trace Type" on page 2137 as follows:

Trace Type	Query Returns:
`WRITe`	`NORMal`
`AVERage`	`AVERage`
`MAXHold`	`POSitive`
`MINHold`	`NEGative`

Preset	`ON`
State Saved	Yes

3.3.10.5 Trace Function

Contains controls to:

- Copy and Exchange traces
- Preset or Clear all traces

From Trace

Selects the trace to be copied to or exchanged with the "To Trace" on page 1153 when a "Copy" on page 1153 or "Exchange" on page 1154 is performed

Preset	1

To Trace

Selects the trace to be copied from or exchanged with the "From Trace" on page 1153 when a "Copy" on page 1153 or "Exchange" on page 1154 is performed

Preset	2

Copy

Executes a Trace Copy based on the "From Trace" on page 1153 and "To Trace" on page 1153 parameters. The copy operation is from the **From Trace** to the **To Trace**. The action is performed once.

The X-Axis settings and domain of a trace are also copied.

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe:COPY TRACE1 | … | TRACE6, TRACE1 | … | TRACE6`
	For all other measurements:
	`:TRACe:<meas>:COPY TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
	where `<meas>` is the identifier for the current measurement
	Note that the format of the `TRACe<n>` parameter differs from that for the Swept SA Measurement

Example	Copy Trace 1 to Trace 3 and put Trace 3 in Update=Off, Display=On `:TRAC:COPY TRACE1,TRACE3`
Notes	The command is of the form: `:TRACe:COPY <source_trace>,<dest_trace>`
Dependencies	When Signal ID is on, this key is grayed-out
Couplings	The destination trace is put in **View** (Update = Off, Display = On) after the copy

Preset	For Swept SA Measurement (in SA Mode):
	`TRACE1, TRACE2`
	For all other measurements:
	`TRACe1, TRACe2`

Exchange

Executes a Trace Exchange based on the "From Trace" on page 1153 and "To Trace" on page 1153 parameters. The **From Trace** and **To Trace** values are exchanged with each other. The action is performed once.

The X-Axis settings and domain of a trace are also copied when it is exchanged with another trace.

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe:EXCHange TRACE1 | … | TRACE6, TRACE1 | … | TRACE6`
	For all other measurements:
	`:TRACe:<meas>:EXCHange TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
	where `<meas>` is the identifier for the current measurement
	Note that the format of the `:TRACe<n>` parameter differs from that for the Swept SA Measurement

Example	Exchange Trace 1 and Trace 2 and put both traces in Update=`OFF`, Display=`ON`: `:TRAC:EXCH TRACE1,TRACE2`
Notes	The command is of the form: `:TRACe:EXCHange <trace_1>,<trace_2>`
Couplings	Both traces are put in **View** (Update=Off, Display=On) after the exchange

Preset All Traces

Turns on Trace 1 and blanks all other traces. This is useful when you have many traces on and you want to return to having only Trace 1 on the display. Does not affect the trace type, detector or any other aspect of the trace system.

Remote Command	`:TRACe[:<meas>]:PRESet:ALL`
Example	`:TRAC:PRES:ALL`
Dependencies	When Signal ID is on, this key is grayed-out

Clear All Traces

Clears all traces. Does not affect the state of any function or variable in the instrument. Loads `mintracevalue` into all of the points for all traces, except traces in **Min Hold**, in which case it loads `maxtracevalue`, even if **Update** = `OFF`.

Remote Command	`:TRACe[:<meas>]:CLEar:ALL`
Example	`:TRAC:CLE:ALL`
Dependencies	When Signal ID is on, this key is grayed-out

3.3.10.6 Advanced

Contains controls for setting advanced trace functions of the instrument.

Measure Trace

Specifies which trace's scalar results are displayed in the **Metrics** window, and retrieved by sending a `:READ` or `:FETCh` query:

- Trace 1
- Trace 2
- Trace 3

Remote Command	`:CALCulate:<meas>:MTRace TRACe1 | TRACe2 | TRACe3`
	`:CALCulate:<meas>:MTRace?`
	`<meas>` is the identifier for the current measurement; any one of `CHPower | ACPower | OBWidth | SEMask | SPURious | PVTime`

Example	Channel Power
	`:CALC:CHP:MTR TRAC1`
	`:CALC:CHP:MTR?`

Dependencies	In the ACP measurement, this control is grayed-out when **Meas Method** is set to `RBW` or `FAST`, and only Trace 1 is enabled
Preset	`TRACe1`
State Saved	No
Range	Trace 1 | Trace 2 | Trace 3

3.4 ACP Measurement

ACP is a measurement of the amount of interference, or power, in an adjacent frequency channel. The results are displayed as a bar graph or as spectrum data, with measurement data at specified offsets.

Measurement Commands

The general functionality of "CONFigure" on page 2997, "INITiate" on page 2998, "FETCh" on page 2998, "MEASure" on page 3000, and "READ" on page 2999 are described in the section **SCPI Operation and Results Query** in the topic **Programming the Instrument**.

The following measurement commands and queries are used to configure the measurement:

`:INITiate:ACPower`	Initiates a trigger cycle for the `ACPower` measurement, but does not return any data. You must then use `:FETC:ACP[n]?` to retrieve data Does not change any measurement settings
`:CONFigure?`	Returns the long form name of current measurement, in this case, `ACPower`
`:CONFigure:ACPower`	Selects `ACP` measurement with Meas Setup settings in preset state – same as "Meas Preset" on page 637
`:CONFigure:ACPower:NDEFault`	Selects `ACP` measurement *without* affecting settings

The following queries are used to retrieve the results:

`:FETCh:ACPower?`	Retrieves the data specified by `n`
`:MEASure:ACPower[n]?`	Switches to `ACP` measurement, restores default values, starts the measurement, then retrieves the data specified by `n`
`:READ:ACPower[n]?`	Starts the measurement, then retrieves the data specified by `n`

Remote Command Results

The following table describes the results returned by the `:FETCh`, `:MEASure`, and `:READ` queries listed above, according to the index value `n`.

n	Results Returned
1, or not specified	Dependent on **Mode**, "Meas Method" on page 582, "Power Ref" on page 676 , and "Measurement Type" on page 676 See "Measurement Results for n = 1, or no Index Specified" on page 498
2	Dependent on "Measurement Type" on page 676. See "Measurement Results for n = 2" on page 501

31	Upper offset B	Relative power	dB

#	Item	Result	Unit, if any
32	Upper offset B	Absolute power	dBm
...	...	...	

When "Max Num of Offsets" on page 633 is 6, returns 48 results (Offset A-F: 48 = 24 + 4*6) and when set to 12, returns 72 results (Offset A-L: 72 = 24 + 4 * 12)

If any result is not available, -999.0 is returned

Measurement Type = Power spectral density reference

For the trace specified by "Measure Trace" on page 1155, returns comma-separated scalar results in the following order:

#	Channel	Item	Unit, if any
1	Channel (1)	Relative power	dB
2	Channel (1)	Absolute power	dBm/Hz or dBm/MHz*
3	Channel (2)	Relative power	dB
4	Channel (2)	Absolute power	dBm/Hz or dBm/MHz*
...	...	...	
23	Channel (12)	Relative power	dB
24	Channel (12)	Absolute power	dBm/Hz or dBm/MHz*
25	Lower offset A	Relative power	dB
26	Lower offset A	Absolute power	dBm/Hz or dBm/MHz*
27	Upper offset A	Relative power	dB
28	Upper offset A	Absolute power	dBm/Hz or dBm/MHz*
29	Lower offset B	Relative power	dB
30	Lower offset B	Absolute power	dBm/Hz or dBm/MHz*
31	Upper offset B	Relative power	dB
32	Upper offset B	Absolute power	dBm/Hz or dBm/MHz*
...	...	...	

When "Max Num of Offsets" on page 633 is 6, returns 48 results (Offset A-F: 48 = 24 + 4*6) and when set to 12, returns 72 results (Offset A-L: 72 = 24 + 4 * 12)

*The unit is determined by "PSD Unit" on page 684: DBMHZ or DBMMHZ

If any result is not available, -999.0 is returned

3.4.3 Measurement Results for n = 3

For the trace specified by "Measure Trace" on page 1155, returns scalar pass/fail values (0 = passed, or 1 = failed) determined by comparing the relative to the reference carrier and by testing the absolute power limit of the offset frequencies (measured as total power in dB if "Measurement Type" on page 676 is **Total Pwr Ref**, or as power spectral density in dB if **Measurement Type** is **PSD Ref**).

When "Max Num of Offsets" on page 633 is 6, returns 24 results (Offset A-F: 24 = 4*6). When set to 12, returns 48 results (Offset A-L: 48 = 4 * 12).

For MSR, LTE-Advanced FDD/TDD, and 5G NR Modes, this trace includes only outer offset results.

#	Item
1	Lower offset A - relative limit result
2	Lower offset A - absolute limit result
3	Upper offset A - relative limit result
4	Upper offset A - absolute limit result
5	Lower offset B - relative limit result
6	Lower offset B - absolute limit result
7	Upper offset B - relative limit result
8	Upper offset B - absolute limit result
...	...

If any result is not available, 1 is returned.

3.4.4 Measurement Results for n = 7

In all cases below:

- for SA Mode, the values are in the current Y Axis Unit of the instrument
- if any result is not available, 9.91E+37 (`NaN`) is returned

Mode	Max Number of Carriers
MSR	100
LTEAFDD, LTEATDD	5
5GNR	16
All Others	18

Measurement Type = Total power reference

For the trace specified by "Measure Trace" on page 1155, returns (2 * Number of Carriers) comma-separated scalar results in the following order:

#	Channel	Result	Unit, if any
1	Channel (1)	Relative power	dB
2	Channel (1)	Absolute power	dBm

#	Channel	Result	Unit, if any
3	Channel (2)	Relative power	dB
4	Channel (2)	Absolute power	dBm
…	…		
2 * Number of Carriers – 1	Channel (Number of Carriers)	Relative power	dB
2 * Number of Carriers	Channel (Number of Carriers)	Absolute power	dBm

Measurement Type = Power spectral density reference

For the trace specified by "Measure Trace" on page 1155, returns (2 * Number of Carriers) comma-separated scalar results in the following order:

#	Channel	Result	Unit, if any
1	Channel (1)	Relative power	dB
2	Channel (1)	Absolute power	dBm/Hz or dBm/MHz*
3	Channel (2)	Relative power	dB
4	Channel (2)	Absolute power	dBm/Hz or dBm/MHz*
…	…		
2 * Number of Carriers - 1	Channel (Number of Carriers)	Relative power	dB
2 * Number of Carriers	Channel (Number of Carriers)	Absolute power	dBm/Hz or dBm/MHz*

*The unit is determined by "PSD Unit" on page 684: DBMHZ or DBMMHZ

3.4.5 Measurement Results for n = 8

Only available in LTEAFDD, LTEATDD, 5GNR, MSR Modes

For the trace specified by "Measure Trace" on page 1155, returns scalar results in the following order:

#	Item	Unit, if any
1	0.0	
2	Total carrier power	dBm
3	Reference Power #1 (See "Reference Power Result Details" on page 505)	
4	Reference Power #2 (See "Reference Power Result Details" on page 505)	
5	Inner Lower offset A - relative power	dB
6	Inner Lower offset A - absolute power	dBm, dBm/Hz or dBm/MHz*
7	Inner Upper offset A - relative power	dB

#	Item	Unit, if any
8	Inner Upper offset A - absolute power	dBm, dBm/Hz or dBm/MHz*
9	Inner Lower offset B - relative power	dB
10	Inner Lower offset B - absolute power	dBm, dBm/Hz or dBm/MHz*
11	Inner Upper offset B - relative power	dB
12	Inner Upper offset B - absolute power	dBm, dBm/Hz or dBm/MHz*
…	…	

This trace includes only inner offset results

When "Max Num of Offsets" on page 633 is 6, returns 28 results (Offset A-F: 24 = 4 + 4*6) and when set to 12, returns 52 results (Offset A-L: 52 = 4 + 4 * 12)

Absolute Power Units

*For Absolute power results, the units depend on the "Measurement Type" on page 676 and "PSD Unit" on page 684 settings as follows:

Measurement Type	PSD Unit	Unit
Total Pwr Ref	All	dBm
PSD Reference	dBm/Hz, `DBMHZ`	dBm/Hz
	dBm/MHz, `DBMMHZ`	dBm/MHz

Reference Power Result Details

The values returned as Reference Power #1 and Reference Power #2 depend on "Power Ref" on page 676:

Power Ref Setting	Option	Reference Power #1	Reference Power #2
Left & Right Carriers	`LRCarriers`	Left or Max Power Carrier in the lower sub-block	Right or Max Power Carrier in the upper sub-block
Max Power Carriers in Sub-block	`MPCSubblock`	dBm, dBm/Hz or dBm/MHz*	dBm, dBm/Hz or dBm/MHz*
Left & Right Sub-blocks	`LRSubblocks`	Integrated Power of the lower sub-block dBm, dBm/Hz or dBm/MHz*	Integrated Power of the upper sub-block dBm, dBm/Hz or dBm/MHz*
Others		0.0	Reference carrier power dBm, dBm/Hz or dBm/MHz*

*For PSD results, the unit is determined by "PSD Unit" on page 684. See "Absolute Power Units" on page 505 above

If any result is not available, 9.91E+37 (`NaN`) is returned

3.4.6 Views

This measurement has two predefined views:

View	Enumerated Parameter	SCPI Number
"Normal" on page 507	`PRESult`	1
"Carrier Info" on page 507	`CINFormation`	2

These are multiple-window views. When in a multiple-window view, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Whenever the view changes, the default menu is **Frequency**, unless otherwise specified in the view description.

NOTE Y Scale/Div, Y Ref Position, Y Auto Scale, Y Ref Value and Bar Graph affect both views. For example, power bars on the traces in both views appear or disappear when Bar Graph is toggled.

View Selection by Name

Selects the results view. The following command allows you to select the desired measurement view by enumerated parameter.

Remote Command	`:DISPlay:ACPower:VIEW[:SELect] PRESult | CINFormation`
	For view names, see table above
	`:DISPlay:ACPower:VIEW[:SELect]?`

Example	`:DISP:ACP:VIEW PRES` `:DISP:ACP:VIEW?`
Preset	`PRESult`
State Saved	Saved in instrument state
Range	`PRESult|CINFormation`

View Selection by Number (Remote Command Only)

Selects the results view. The following command allows you to select the desired measurement view numerically.

Remote Command	`:DISPlay:ACPower:VIEW:NSELect <integer>`
	For view numbers, see table above
	`:DISPlay:ACPower:VIEW:NSELect?`

Example	`:DISP:ACP:VIEW:NSEL 1` `:DISP:ACP:VIEW:NSEL?`
Dependencies	Available only for LTEAFDD, LTEATDD and 5G NR Modes
Preset	1
State Saved	Saved in instrument state
Min/Max	1 / 2

3.4.6.1 Normal

Windows: "Graph" on page 507, "Metrics" on page 508,

Dual window view of the graph and the metrics.

Example	`:DISP:ACP:VIEW PRES`

3.4.6.2 Carrier Info

Windows: "Graph" on page 507, "Metrics" on page 508,

Dual window view of the graph and the metrics.

Example	`:DISP:ACP:VIEW CINF`

3.4.7 Windows

This section describes the windows that are available in this measurement.

3.4.7.1 Graph

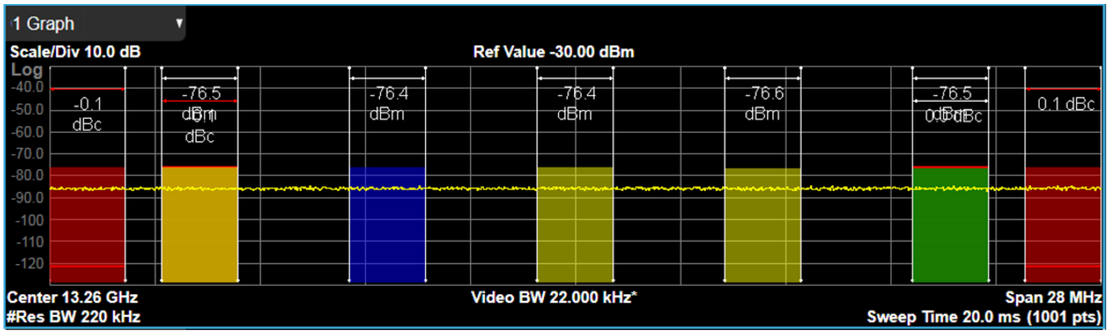
Window #1

Used to display the spectrum being measured by the ACP measurement.

The results of the measurement can be displayed as a single spectrum trace view or displayed with a Bar Graph trace on the spectrum trace.

The Graph window appears in several Views, as follows:

View	Size	Position
Normal	Half, full width	Top
Carrier Info	Half, full width	Top
Gate View	One third, full width	Middle



When the Bar Graph is ON and Limit Test is ON, the color of each bar graph reflects the limit test result. When the limit test fails, the bar color is red, and when limit test passes, the bar color is green.

When RBW is selected as the measurement method, the spectrum trace is not displayed, only the bar graph is displayed. In addition, the Bar Graph control (under the Display front-panel key) is set to ON and is grayed-out.

3.4.7.2 Metrics

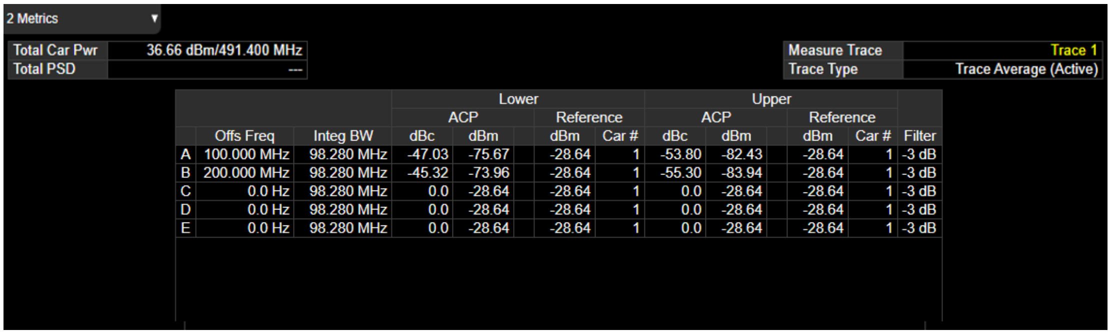
Window # 2 & 3

Displays the textual results of the ACP measurement.

Views in which the Metrics window appears:

View	Size	Position
Normal	Half, full width	Bottom
Carrier Info	Half, full width	Bottom
Gate View	One Third, full width	Bottom

Metrics Window in Normal view:



Total Car Pwr	36.66 dBm/491.400 MHz
Total PSD	---

Measure Trace	Trace 1
Trace Type	Trace Average (Active)

			Lower				Upper				
			ACP		Reference		ACP		Reference		
	Offs Freq	Integ BW	dBc	dBm	dBm	Car #	dBc	dBm	dBm	Car #	Filter

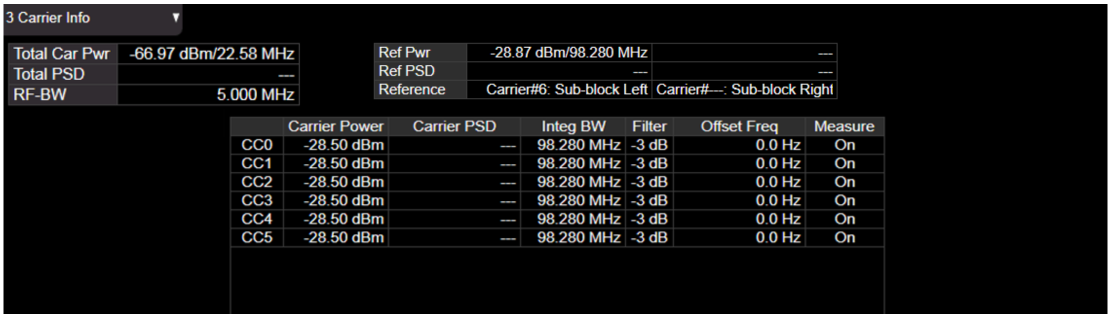
D	0.0 Hz	98.280 MHz	0.0	-28.64	-28.64	1	0.0	-28.64	-28.64	1	-3 dB
E	0.0 Hz	98.280 MHz	0.0	-28.64	-28.64	1	0.0	-28.64	-28.64	1	-3 dB

Metrics Window in Carrier Info view:



Total Car Pwr	-66.97 dBm/22.58 MHz
Total PSD	---
RF-BW	5.000 MHz

Ref Pwr	-28.87 dBm/98.280 MHz	---
Ref PSD	---	---
Reference	Carrier#6: Sub-block Left	Carrier#---: Sub-block Right

	Carrier Power	Carrier PSD	Integ BW	Filter	Offset Freq	Measure
CC0	-28.50 dBm	---	98.280 MHz	-3 dB	0.0 Hz	On
CC1	-28.50 dBm	---	98.280 MHz	-3 dB	0.0 Hz	On
CC2	-28.50 dBm	---	98.280 MHz	-3 dB	0.0 Hz	On
CC3	-28.50 dBm	---	98.280 MHz	-3 dB	0.0 Hz	On
CC4	-28.50 dBm	---	98.280 MHz	-3 dB	0.0 Hz	On
CC5	-28.50 dBm	---	98.280 MHz	-3 dB	0.0 Hz	On

The text window displays the following results:

Total Carrier Power

This is the total power of all the carriers with carrier power present set to yes. The power is calculated by integrating across the bandwidth declared by the Carrier Integ BW parameter for each carrier and then totaling the sums. The total integration bandwidth is shown as part of the result. This will be the total of the Carrier Integ Bw of the carriers used in calculating the total carrier power. If the RRC Filter is on, then the integration bandwidth used is (1 + alpha)/T where T = 1/(Carrier Integ BW) multiplied by the number of carriers with carrier power present set to yes.

Ref Power

This is the power of the reference. The power is calculated by integrating across the bandwidth defined by the Reference Type. The integration bandwidth is shown as a part of the result. For some Power Reference Type, this is the value of the Carrier Integ BW for that carrier unless the RRC Filter is on, then the integration bandwidth used is the displayed value, which is (1 + alpha)/T where T = 1/(Carrier Integ BW).

Reference

In multi-carrier applications, this row displays what is used as a reference power.

Carrier Power

This is the power in all the currently defined carriers. If the carrier has carrier power present, the power will be absolute. If the carrier is defined as not having power present, the power will be relative to the reference carrier. The power is calculated by integrating across the bandwidth declared by the Carrier Integ BW parameter. The integration bandwidth is shown as part of the result. This is the value of the Carrier Integ BW for the carrier unless the RRC Filter is on, then the integration bandwidth used is the displayed value, which is (1 + alpha)/T where T = 1/(Carrier Integ BW).

Offset Relative Power

This is the power in the offsets relative to the reference carrier. The power is calculated by integrating across the bandwidth declared by the Offset Integ BW parameter. The offset integration bandwidth is shown as part of the result. This is the value on the Offset Integ BW menu unless the RRC Filter is on, then the integration bandwidth used is the displayed value, which is (1 + alpha)/T where T = 1/(Offset Integ BW).

Offset Absolute Power

This is the absolute power in the offsets. The power is calculated by integrating across the bandwidth declared by the Offset Integ BW parameter. The offset integration bandwidth is shown as part of the result. This is the value on the Offset Integ BW menu unless the RRC Filter is on, then the integration bandwidth used is the displayed value, which is (1 + alpha)/T where T = 1/(Offset Integ BW).

RF-BW

Displays the total bandwidth from the lowest carrier to the highest carrier whatever their measurement states are on or off.

Integration Bandwidth

Displays the noise bandwidth of each carrier to be measured in the ACP measurement

Measure Trace

See "Measure Trace" on page 1155.

Trace Type

This is the trace type (and view/blank parameter) of a trace specified by Measure Trace.

Measure Trace and Trace Type are displayed only when Meas Method is set to “Integration BW”, “Filtered IBW”, or “Fast Power”

Filter

Indicates whether RRC filter is used for ACP measurement or not.

Offset Frequency

Shows the offset frequency from the carrier reference frequency in multi-carrier measurements. The carrier frequency display type determines whether the relative frequency or absolute frequency will be displayed.

Sub-block

For intra-band non-contiguous spectrum operation, the sub-block concept is introduced, which refers to one contiguous allocated block of spectrum for transmission and reception in the intra-band non-contiguous aggregation mode. So far we support the two sub-blocks. It displays which sub-block the carrier belongs to in the intra-band non-contiguous aggregation mode. The column will be displayed when the carrier allocation mode is non-contiguous.

Measure

Shows whether the carrier power presents or not.

3.4.7.3 Gate

Window # 4

Turning on Gate View displays the Gate Window, which allows you to see your gating signal at the same time as the measured data. See the description under **Gate View** in the **Trigger**, **Gate Settings** section.

View	Size	Position
Gate View	One third, full width	Top

3.4.7.4 Marker Table

Window# 5

Displays a table containing detailed information about all the markers in the current measurement. It can be selected from the Data control on the Window Title. There is no specific view in which the **Marker Table** window turns on, it is on by demand.

3.4.8 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.4.8.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The reference line is at the top, center, or bottom of the graticule, depending on the value of the **Ref Position** function.

Remote Command	`:DISPlay:ACPower:WINDow[1]:TRACe:Y[:SCALe]:RLEVel <real>` `:DISPlay:ACPower:WINDow[1]:TRACe:Y[:SCALe]:RLEVel?`
Example	`:DISP:ACP:WIND:TRAC:Y:RLEV 100` `:DISP:ACP:WIND:TRAC:Y:RLEV?`
Couplings	When "Auto Scaling" on page 514 is ON (default), this value is automatically determined by the measurement result. When you set a value manually, **Auto Scaling** changes to `OFF` "Attenuation" on page 2158 is not coupled to **Ref Value**
Preset	10.00 dBm
State Saved	Saved in instrument state
Min/Max	-250.00 dBm / 250.00 dBm
Annotation	Ref <value> top left of graph
Backwards Compatibility SCPI	`:DISPlay:ACPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RLEVel`

Scale/Div

For measurements that support a logarithmic Y-Axis, **Scale/Div** sets the height of one division of the graticule in the current Y-Axis unit.

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule division on the display, the total amplitude range of the graph is typically 10x this amount. For example, if Scale/Div is 10 dB, then the total range of the graph is 100 dB.

Remote Command	`:DISPlay:ACPower:WINDow[1]:TRACe:Y[:SCALe]:PDIVision <rel_ampl>` `:DISPlay:ACPower:WINDow[1]:TRACe:Y[:SCALe]:PDIVision?`
Example	`:DISP:ACP:WIND:TRAC:Y:PDIV 5` `:DISP:ACP:WIND:TRAC:Y:PDIV?`

Couplings	Coupled to "Scale Range" on page 1002 as follows: **Scale/Div** = **Scale Range**/10 (number of divisions) When "Auto Scaling" on page 514 is `ON`, this value is automatically determined by the measurement result When you change a value, **Auto Scaling** automatically changes to Off
Preset	10.00 dB / Div
State Saved	Saved in instrument state
Min	0.10 dB
Max	20 dB
Annotation	<value> dB/ left upper of graph
Backwards Compatibility SCPI	`:DISPlay:ACPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PDIVision`

Scale Range

Sets the Y-Axis scale range.

Remote Command	Replace `<meas>` with the identifier for the current measurement
	`:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe <rel_ampl>`
	`:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe?`

Example	`:DISP:CHP:WIND:TRAC:Y:RANG 100` `:DISP:CHP:WIND:TRAC:Y:RANG?`
Couplings	Coupled to **Scale/Div** as follows **Scale Range** = **Scale/Div** * 10 (number of divisions) When you change this value, **Auto Scaling** automatically changes to `OFF`
Preset	100 dB
State Saved	Saved in instrument state
Min	1
Max	200

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change the reference level value.

Remote Command	`:DISPlay:ACPower:WINDow[1]:TRACe:Y[:SCALe]:RPOSition TOP | CENTer | BOTTom` `:DISPlay:ACPower:WINDow[1]:TRACe:Y[:SCALe]:RPOSition?`
Example	`:DISP:ACP:WIND:TRAC:Y:RPOS CENT`

	`:DISP:ACP:WIND:TRAC:Y:RPOS?`
Preset	`TOP`
State Saved	Saved in instrument state
Range	`TOP|CENTer|BOTTom`
Annotation	The greater than (>) and less than (<) symbols are displayed on both sides of the graph to indicate the Reference Position
Backwards Compatibility SCPI	`:DISPlay:ACPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RPOSition`

Auto Scaling

Toggles **Auto Scaling** On or Off.

Remote Command	`:DISPlay:ACPower:WINDow[1]:TRACe:Y[:SCALe]:COUPle 0 | 1 | OFF | ON` `:DISPlay:ACPower:WINDow[1]:TRACe:Y[:SCALe]:COUPle?`
Example	`:DISP:ACP:WIND:TRAC:Y:COUP OFF` `:DISP:ACP:WIND:TRAC:Y:COUP?`
Couplings	When **Auto Scaling** is `ON`, and the **Restart** front-panel key is pressed, this function automatically sets the scale per division to 10 dB and determines the reference values based on the measurement results When you change the value of **"Scale/Div" on page 512**, **"Ref Value" on page 512**, or "Scale Range" on page 1002, **Auto Scaling** automatically changes to `OFF`
Preset	1
State Saved	Saved in instrument state
Range	`OFF|ON`
Backwards Compatibility SCPI	`:DISPlay:ACPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:COUPle`

3.4.8.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See "Dual-Attenuator Configurations" on page 515
- See "Single-Attenuator Configuration" on page 516

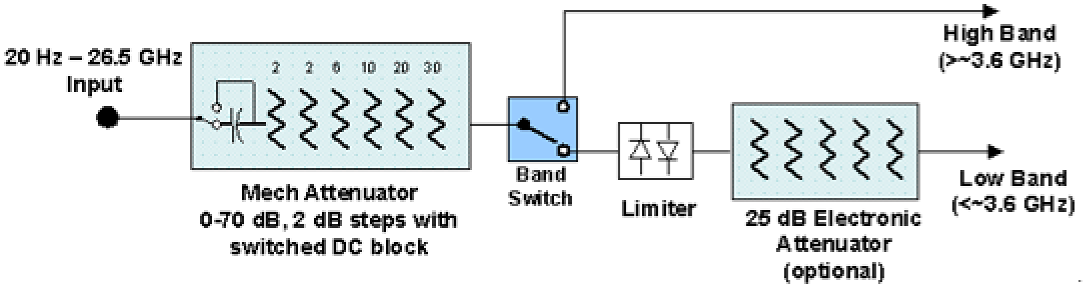
Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9420A/10A/11A/15A/16A, M9410E/11E/15E/16E, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

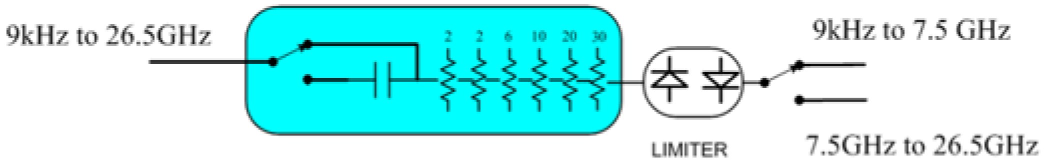
Dependencies	In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the **Range** tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

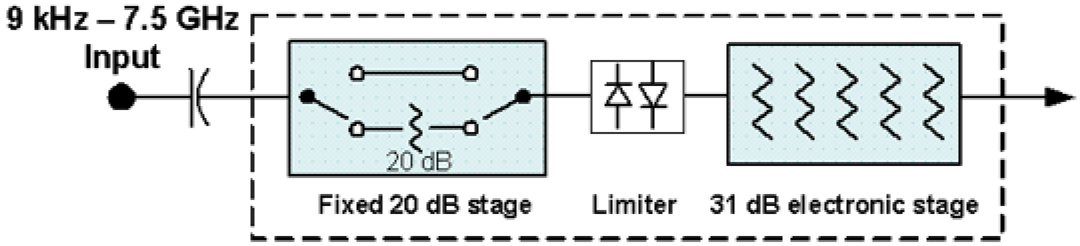


Configuration 2: Mechanical attenuator, no optional electronic attenuator

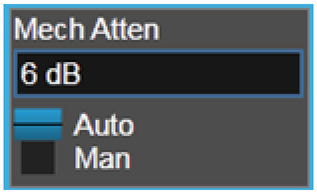


Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

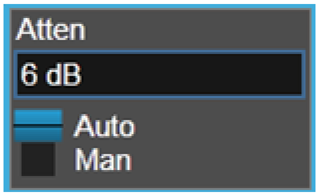
Single-Attenuator Configuration



You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.



Dual Attenuator



Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	`[:SENSe]:POWer[:RF]:FRATten <rel_ampl>` `[:SENSe]:POWer[:RF]:FRATten?`
Example	`:POW:FRAT 14`

	`:POW:FRAT?`
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See **Reference Level** and "Mech Atten" on page 2161 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	When the **Input** is **RF**, and the **Input Port** is **RF Input 2**, and the Full Range Attenuator is installed: On the Meas Bar, the field "Atten" displays as follows: – If the sweep is entirely < 50 GHz, the value shown after "Atten:" is equal to Mech Atten + Elec Atten + Full Range Atten – If the sweep is entirely > 50 GHz, the value shown after "Atten:" is equal to Full Range Atten – If the sweep straddles 50 GHz, the value shown after "Atten:" is preceded by the symbol ">=" and is equal to Full Range Atten In the **Amplitude**, "Y Scale" on page 2153 menu, and the Atten **Meas Bar** dropdown menu panel, a summary is displayed as follows: "Total Atten below 50 GHz" followed by the value of Full Range Atten + Mech Atten + Elec Atten "Total Atten above 50 GHz" followed by the value of Full Range Atten For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown: – Attenuator summary: – Total Atten below 50 GHz: 30 dB – Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models, and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to **Ref Level**, "Internal Preamp" on page 2183 Gain, any External Gain that is entered, and **Max Mixer Level** (if available), as described in the table below.

See "Attenuator Configurations and Auto/Man" on page 519

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation <rel_ampl>` `[:SENSe]:POWer[:RF]:ATTenuation?`
Example	`:POW:ATT 20` Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of “main” attenuation) In either case, if the attenuator was in Auto, it is set to Manual
Dependencies	Some measurements do not support **Auto** setting of **Mech Atten**. In these measurements, the **Auto/Man** selection is not available, and the **Auto/Man** toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the **Auto/Man** toggle function is not available. The state of **Auto/Man** is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 2164 See "Attenuator Configurations and Auto/Man" on page 519 for more information on the **Auto/Man** functionality
Couplings	If the RF Input Port is the RF Input: – If the USB Preamp is connected to USB, use 0 dB for **Mech Atten** – Otherwise compute the auto-selected value of **Mech Atten** based on **Reference Level**, **Int Preamp**, **External Gain**, **Ref Level Offset**, **Max Mixer Level**, **µW Path Control** and **IF Gain** settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) – In N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the value of "Full Range Atten" on page 2160 from the result to determine the **Mech Atten**. Limit the value so that it is never lower than 0 dB and so that total attenuation, including **Full Range Atten**, is never less than 6 dB (total attenuation, including **Full Range Atten** below 6 dB, can never be chosen by Auto) In External Mixing and BBIQ, where the attenuator is not in the signal path, the attenuator setting changes as described above when **Mech Atten** is in **Auto**, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input For CXA-m with Option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is <= 7.5 GHz. So, when the frequency is changed from below 7.5 GHz to above 7.5 GHz, the attenuation setting changes to a multiple of 10 dB that is no smaller than the previous setting. For example, 4 dB attenuation changes to 10 dB
Preset	**Auto** The Auto value is 10 dB
State Saved	Saved in instrument state
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased

Max	CXA Option 503 or 507	50 dB
	EXA	60 dB
	All other models	70 dB
	Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB	
Annotation	The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as: *Atten: <total> dB (e<elec>)* The e letter is in amber in Single-Attenuator configurations For example: Dual-Attenuator configuration: *Atten: 24 dB (e14)* Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB Single-Attenuator configuration: *A: 24 dB (e14)* Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation) When in Manual, a # sign appears in front of Atten in the annotation	

Auto Function

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:ATTenuation:AUTO?`
Example	Turn **Auto Mech Atten** `ON`: `:POW:ATT:AUTO ON`
Dependencies	`:POW:ATT:AUTO` is only available in measurements that support **Auto**, such as Swept SA
Preset	`ON`

Attenuator Configurations and Auto/Man

As described under "Attenuation" on page 2158, there are two distinct attenuator configurations available in the X-Series, the Single Attenuator and Dual-Attenuator configurations.

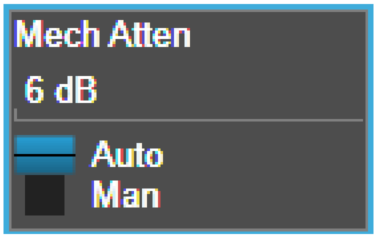
In Dual-Attenuator configurations, we have mechanical attenuation and electronic attenuation, and current total attenuation is the sum of electronic + mechanical attenuation.

In Single-Attenuator configurations, we refer to the attenuation set using "Mech Atten" on page 517 (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then current total attenuation is the sum of main + soft attenuation.

See "Elec Atten" on page 2164 for more about “soft” attenuation.

NOTE

In some measurements, the **Mech Atten** control has an **Auto/Man** function. In these measurements, an **Auto/Man** switch is shown on the **Mech Atten** control:



Mech Atten

6 dB

Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no **Auto/Man** function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten

10 dB

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details of the Electronic Attenuator, see "More Information" on page 522

Remote Command	`[:SENSe]:POWer[:RF]:EATTenuation <rel_ampl>` `[:SENSe]:POWer[:RF]:EATTenuation?`
Example	`:POW:EATT 10` `:POW:EATT?`
Notes	Electronic Attenuation’s specification is defined only when **Mech Atten** is 6 dB

Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no "electronic attenuator"; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, `EATT` SCPI commands are accepted for compatibility with other X-series instruments, and set a "soft" attenuation. The "soft" attenuation is treated as an addition to the "main" attenuation value set by the **Attenuation** control or `:POW:ATT`, and affects the total attenuation displayed on the **Attenuation** control and the Meas Bar The electronic attenuator, and the "soft" attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out If "Internal Preamp" on page 2183 is `ON` (that is, set to Low Band or Full), the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned If both the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence If the electronic/soft Attenuator is enabled, then the **Stop Freq** of the instrument is limited to 3.6 GHz and **Internal Preamp** is unavailable If "LNA" on page 2185 is `ON`, the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out. This coupling works in the following modes/measurements: – Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes – Transmit On|Off Power measurement in 5GNR Mode – Power vs. Time and Transmit Power measurement in GSM/EDGE Mode – Burst Power measurement in Spectrum Analyzer Mode The SCPI-only "soft" electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement
Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in "Mechanical Attenuator Transition Rules" on page 522
Preset	0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the **Mech Atten** control description

Auto Function

Remote Command	`[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:EATTenuation:STATe?`
Example	`:POW:EATT:STAT ON` `:POW:EATT:STAT?`
Preset	`OFF` (Disabled) for Swept SA measurement `ON` (Enabled) for all other measurements that support the electronic attenuator

NOTE

The maximum **Center Frequency** for Low Band can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values <= 40 MHz have a maximum Low Band frequency of 3.6 GHz, while 40 MHz < IFBW <= 1 GHz have a maximum of 3.3 GHz, and 1 GHz < IFBW <= 1.5 GHz have a maximum of 3.5 GHz. This frequency is reflected in the disabled message displayed for Electrical Attenuator. For N9032B and N9042B IFBW values > 1.5 GHz do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, the Electrical Attenuator will remain disabled no matter the Center Frequency.

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See "Using the Electronic Attenuator: Pros and Cons" on page 523 for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the “soft” attenuation feature replaces the Dual-Attenuator configuration’s electronic attenuator. All the same couplings and limitations apply. See "Attenuator Configurations and Auto/Man" on page 2163

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode

- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled
- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "Pre-Adjust for Min Clipping" on page 2168.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Example	`:POW:RANG:OPT IMM`
Notes	Executing **Adjust Atten for Min Clipping** initiates the measurement
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate` is executed.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLy | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?`
Example	`:POW:RANG:OPT:TYPE EONL`

	`:POW:RANG:OPT:TYPE?`
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	`COMBined`
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is `ON`, it applies the adjustment described under "Adjust Atten for Min Clipping" on page 2167 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "Adjustment Algorithm" on page 526

Selection	SCPI	Note
Off	`OFF`	This is the default setting
On	`ON`	Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the `ON` parameter is supported and mapped to `COMBined`
Elec Atten Only	`ELECtrical`	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Elec+Mech Atten	`COMBined`	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Example	`:POW:RANG:OPT:ATT OFF` `:POW:RANG:OPT:ATT?`
Notes	The parameter option `ELECtrical` sets this function to `ON` in Single-Attenuator models The parameter option `COMBined` is mapped to `ELECtrical` in Single-Attenuator models. If you send `COMBined`, it sets the function to `ON` and returns `ELEC` to a query For SCPI compatibility with models that do not have an input attenuator, the `ON` parameter is honored and mapped to `COMBined`
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when "Elec Atten" on page 2164 is `OFF` or grayed-out, "Pre-Adjust for Min Clipping" on page 525 is grayed-out

	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	`OFF` when Elec Atten is Disabled at preset, otherwise `ELEC`
State Saved	Saved in instrument state
Range	Dual-Attenuator models: Off | Elec Atten Only | Mech + Elec Atten Single-Attenuator models: Off | On

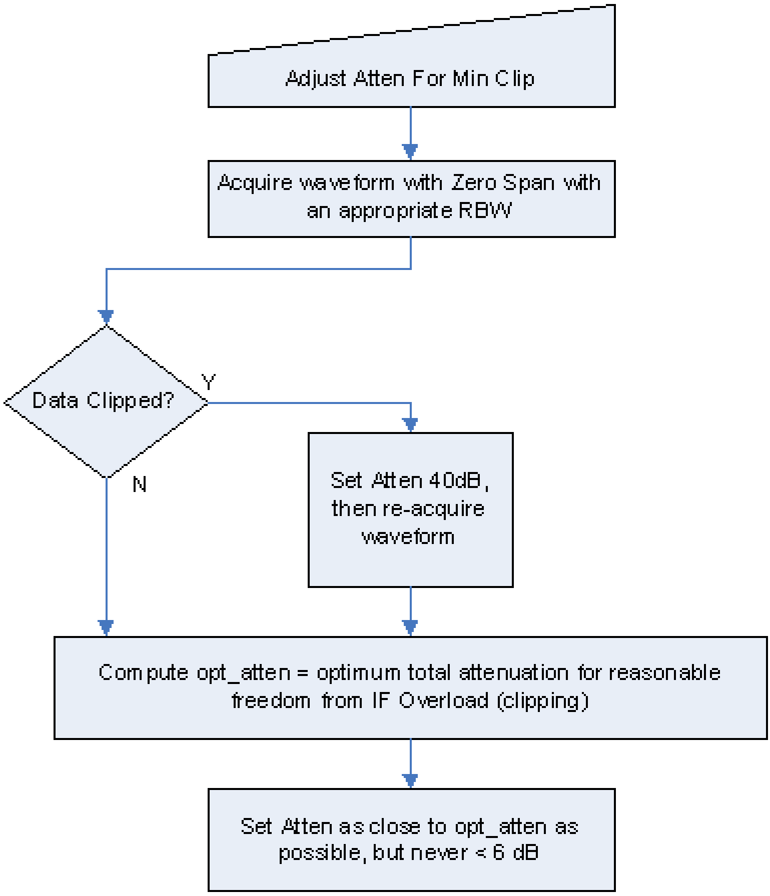
Backwards Compatibility Command

Notes	`ON` aliases to "Elec Atten Only" (`:POW:RANG:OPT:ATT ELEC`) `OFF` aliases to "Off" (`:POW:RANG:OPT:ATT OFF`) `:POW:RANG:AUTO?` returns true if `:POW:RANG:OPT:ATT` is not `OFF`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:RANGe:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:RANGe:AUTO?`

Adjustment Algorithm

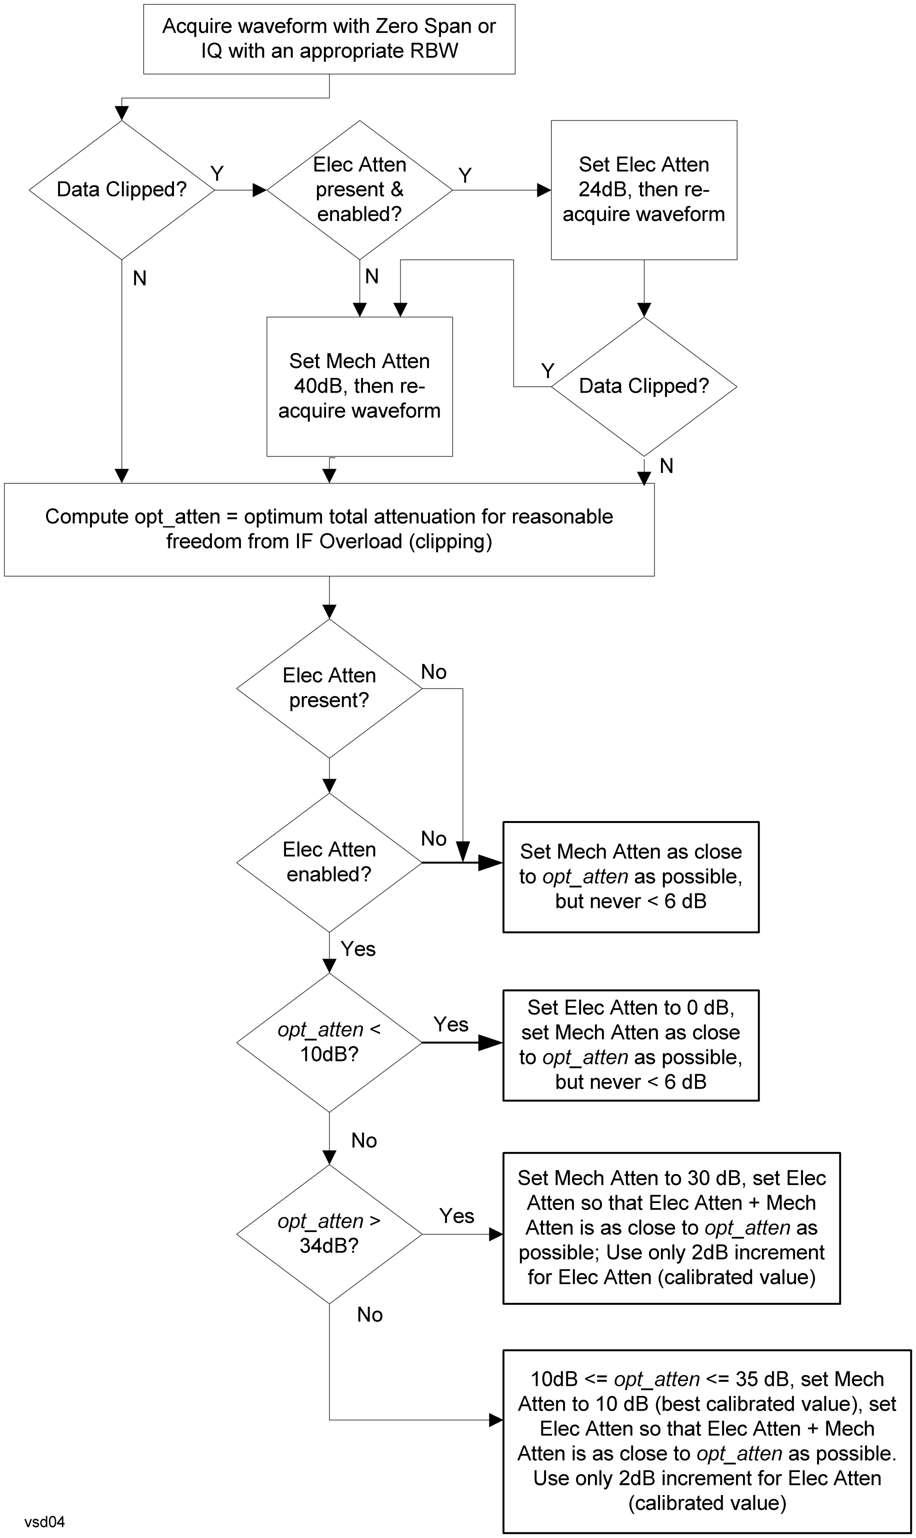
The algorithms for the adjustment are documented below:

Single-Attenuator Models



Dual-Attenuator models

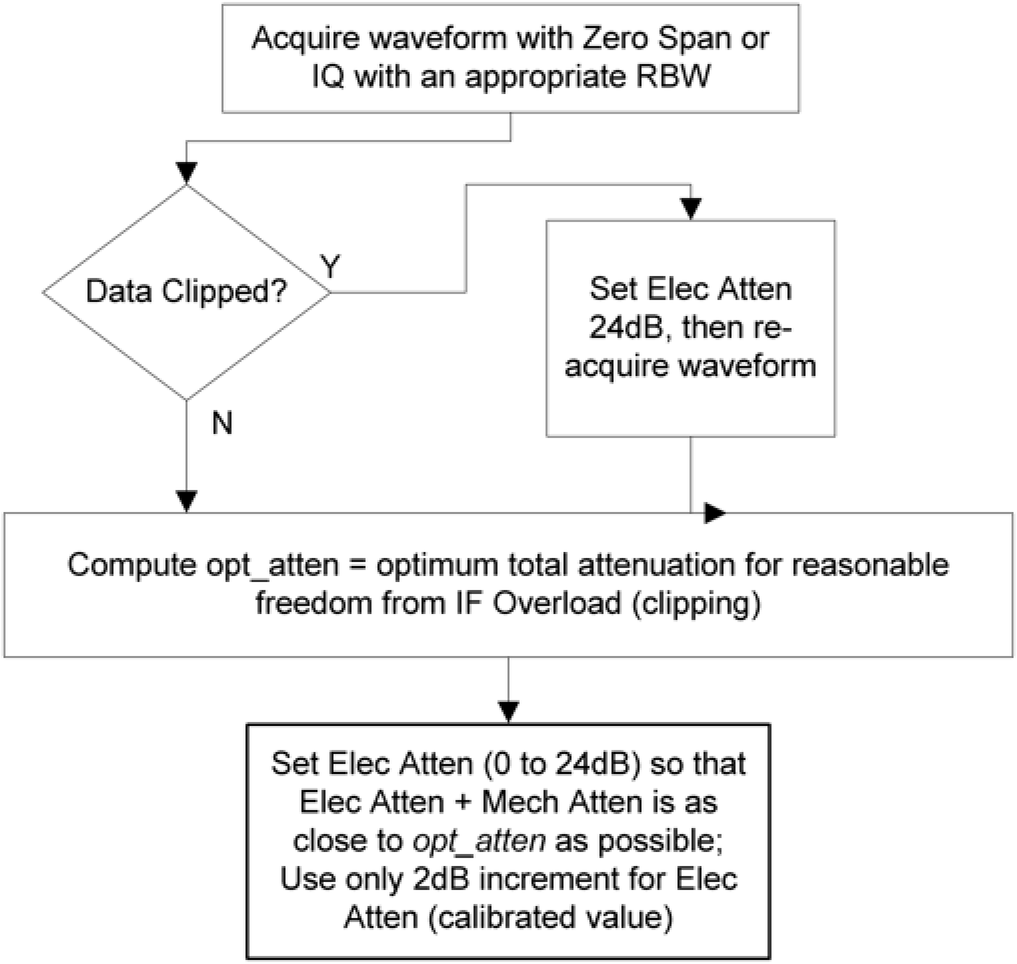
"Adjust Atten for Min Clipping" on page 2167 or "Pre-Adjust for Min Clipping" on page 525 selection is Mech + Elec Atten:



Acquire waveform with Zero Span or IQ with an appropriate RBW
Data Clipped?
Y
N
Elec Atten present & enabled?
Y
N
Set Elec Atten 24dB, then re-acquire waveform
Set Mech Atten 40dB, then re-acquire waveform
Y
Data Clipped?
N
Compute opt_atten = optimum total attenuation for reasonable freedom from IF Overload (clipping)
Elec Atten present?
No
Elec Atten enabled?
No
Set Mech Atten as close to *opt_atten* as possible, but never < 6 dB
Yes
opt_atten < 10dB?
Yes
Set Elec Atten to 0 dB, set Mech Atten as close to *opt_atten* as possible, but never < 6 dB
No
opt_atten > 34dB?
Yes
Set Mech Atten to 30 dB, set Elec Atten so that Elec Atten + Mech Atten is as close to *opt_atten* as possible; Use only 2dB increment for Elec Atten (calibrated value)
No
10dB <= *opt_atten* <= 35 dB, set Mech Atten to 10 dB (best calibrated value), set Elec Atten so that Elec Atten + Mech Atten is as close to *opt_atten* as possible. Use only 2dB increment for Elec Atten (calibrated value)
vsd04

"Pre-Adjust for Min Clipping" on page 525 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.



Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?`
Example	`:POW:ATT:STEP 2` `:POW:ATT:STEP?`
Notes	Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

3.4.8.3 Range (Non-attenuator models)

Only available for Keysight’s modular signal analyzers and certain other Keysight products, such as VXT and M941xE.

State Saved	No

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe <real>` `[:SENSe]:POWer[:RF]:RANGe?`
Example	`:POW:RANG 10 dBm` `:POW:RANG?`
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the **Center Frequency** The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min/Max	–/+100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements

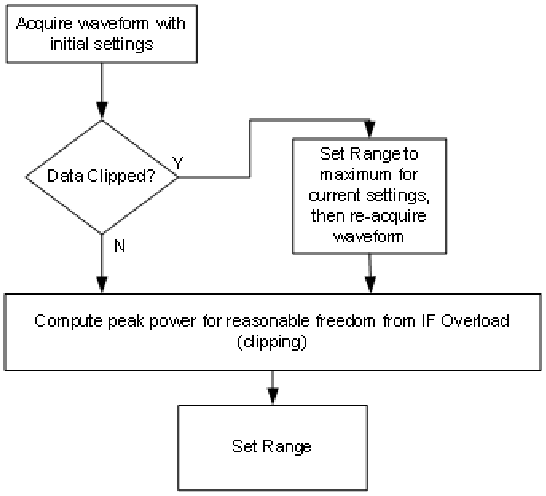
Pre-Adjust for Min Clipping

If this function is `ON`, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Notes	Because there is no attenuator control available in these models, the control displays only `ON` and `OFF` choices. However, for SCPI compatibility with other platforms, all three parameters (`ELECtrical`, `COMBined`, and `ON`) are honored and all are mapped to `ELECtrical`, so if any of these three parameters is sent, a subsequent query will return `ELEC`
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements
Preset	`OFF` for Swept SA measurement; `ON` for all other measurements that support **Pre-Adjust for Min Clipping**
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:



Peak-to-Average Ratio

Used with "Range (Non-attenuator models)" on page 2177 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:PARatio <real>` `[:SENSe]:POWer[:RF]:RANGe:PARatio?`	
Example	`:POW:RANG:PAR 12 dB`	
Notes	In some Modes, this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempts to change the value via SCPI are ignored, but no error message is generated	
Dependencies	Does not appear in Spectrum Analyzer Mode	
Preset	VXT Models M9410A/11A	0 dB
	All Others	10 dB
State Saved	Saved in instrument state	
Min	0 dB	
Max	VXT Models M9410A/11A	50 dB
	All Others	20 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "Peak-to-Average Ratio" on page 2179. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real>` `[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?`
Example	`:POW:RANG:MIX:OFFS -5 dB`
Preset	0 dB
State Saved	Saved in instrument state
Min	VXT Models M9410A/11A: -34 dB All Others: -35 dB
Max	30 dB

3.4.8.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9420A, or UXM.

This tab *does* appear in VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E, because "Software Preselection" on page 2195 is under this tab, and VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range

between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "Preselector Adjust" on page 2182 changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in "Proper Preselector Operation" on page 534.

Remote Command	`[:SENSe]:POWer[:RF]:PCENter`
Example	`:POW:PCEN`
Notes	The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command
Dependencies	Does not appear in CXA-m, nor in VXT Models M9410A/11A/15A/16A, M9410E/11E/15E/16E Grayed-out if the microwave preselector is off – If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken – Grayed-out if entirely in Band 0, that is, if **Stop Freq** is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if **Start Freq** is above 50 GHz – Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 – Grayed-out in the **Spectrogram** View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering appears in "Preselector Adjust" on page 2182
Status Bits/OPC dependencies	When centering the preselector, `*OPC` does not return true until the process is complete and a subsequent measurement has completed, nor are results returned in response to `:READ` or `:MEASure` queries The `Measuring` bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak

search to find

2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "Presel Center" on page 2181 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	`[:SENSe]:POWer[:RF]:PADJust <freq>` `[:SENSe]:POWer[:RF]:PADJust?`
Example	`:POW:PADJ 100KHz` `:POW:PADJ?`
Notes	The value on the control is displayed to 0.1 MHz resolution
Dependencies	– Does not appear in CXA-m – Does not appear in VXT Models M9410A/11A/15A/16A – Does not appear in M9410E/11E/15E/16E – Grayed-out if microwave preselector is off – Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz – Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the **Spectrogram** View
Preset	0 MHz

State Saved	The **Preselector Adjust** value set by "Presel Center" on page 2181, or by manually adjusting **Preselector Adjust** Not saved in instrument state, and does not survive a Preset or power cycle
Min/Max	–/+500 MHz
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PADJust` `[:SENSe]:POWer[:RF]:MMW:PADJust`

Backwards Compatibility Command

Notes	The command has no effect, and the query always returns `MWAVe`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVe | MMWave | EXTernal` `[:SENSe]:POWer[:RF]:PADJust:PRESelector?`

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	:POW:GAIN OFF	
Low Band	:POW:GAIN ON :POW:GAIN:BAND LOW	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	:POW:GAIN ON :POW:GAIN:BAND FULL	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE The maximum **Center Frequency** for **Low Band**, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values <= 40 MHz have a maximum **Low Band** frequency of 3.6 GHz, while 40 MHz < IFBW <= 1 GHz have a maximum of 3.3 GHz, and 1 GHz < IFBW <= 1.5 GHz have a maximum of 3.5 GHz. IFBW values > 1.5 GHz do not support a **Center Frequency** that can reach the **Low Band** maximum frequency. In these cases, **N/A** is displayed in the square brackets for **Low Band**.

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:BAND LOW | FULL` `[:SENSe]:POWer[:RF]:GAIN:BAND?`
Example	`:POW:GAIN:BAND LOW` `:POW:GAIN:BAND?`
Dependencies	Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A nor in M9410E/11E/15E/16E If `:POW:GAIN:BAND FULL` is sent when a low band preamp is available, the preamp band parameter is set to `LOW` instead of `FULL`, and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled
Preset	`LOW`
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says “Off” if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says “3.6 GHz”. If it is a 13.6 GHz preamp and it is set to Full Range the annotation says “13.6 GHz” When the USB Preamp is connected to USB, the Preamp annotation says “Preamp: USB” if the internal preamp is off or “Preamp: USB, Int” if the internal preamp is on (only for measurements that support the USB preamp)

Auto Function

Remote Command	`[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN[:STATe]?`
Example	`:POW:GAIN OFF` `:POW:GAIN?`
Preset	`OFF`

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to "Internal Preamp" on page 2183. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

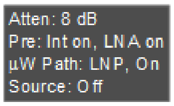
For best possible sensitivity, **LNA** can be turned on *together* with "Internal Preamp" on page 2183, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see "More Information" on page 538

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?`
Example	`:POW:GAIN:LNA ON`
Dependencies	Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9420A/10A/11A M9410E/11E/15E/16E support LNA May not appear in some measurements **LNA** is not available when the electronic/soft attenuator is enabled
Preset	`OFF`
State Saved	Saved in State

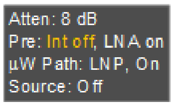
More Information

When **LNA** is installed, the preamp annotation changes to show the state of both **LNA** and **Internal Preamp**. Below is an example:



Atten: 8 dB
Pre: Int on, LNA on
µW Path: LNP, On
Source: Off

Note that when operating entirely in the low band (below about 3.6 GHz), if **LNA** is on, **Internal Preamp** is switched off (even if you have its switch set to ON). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:



Atten: 8 dB
Pre: Int off, LNA on
µW Path: LNP, On
Source: Off

µW Path Control

Options for this control include **µW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the µW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **µW Preselector Bypas**s, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the µW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21-26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **µW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. µW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See "Low Noise Path Enable" on page 543
µW Preselector Bypass	:POW:MW:PATH MPB	See "µW Preselector Bypass" on page 545
Full Bypass Enable	:POW:MW:PATH FULL	See "Full Bypass Enable" on page 546

<table>
<tr><td>Remote Command</td><td><code>[:SENSe]:POWer[:RF]:MW:PATH STD | LNPath | MPBypass | FULL</code>
<code>[:SENSe]:POWer[:RF]:MW:PATH?</code></td></tr>
<tr><td>Example</td><td><code>:POW:MW:PATH LNP</code>
Enables the Low Noise path
<code>:POW:MW:PATH?</code></td></tr>
<tr><td>Notes</td><td>When "Presel Center" on page 2181 is performed, the instrument momentarily switches to the Standard Path, regardless of the setting of µW Path Control
The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean “when the low noise path is enabled” but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is Low Noise Path Enable or Full Bypass Enable. In the case where the DC Block is switched in, the instrument is now AC-coupled. However, if you selected DC coupling, the UI would still behave as though it were DC-coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC-coupled
Alignment switching ignores the settings in this menu, and restores them when finished</td></tr>
<tr><td>Dependencies</td><td>Does not appear in CXA-m, VXT Models M9410A/11A/15A/16A, nor in M9410E/11E/15E/16E, BBIQ and External Mixing
– The Low Noise Path Enable selection does not appear unless Option LNP is present and licensed
– The µW Preselector Bypass selection does not appear unless Option MPB is present and licensed
– The Full Bypass Enable selection does not appear unless options LNP and MPB are both present as well as option FBP
In any of these cases, if the required options are not present and the SCPI command is sent, error -241, "Hardware missing; Option not installed" is generated
Low Noise Path Enable and Full Bypass Enable are grayed-out if the current measurement does not support them
Low Noise Path Enable and Full Bypass Enable are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, “Setting Conflict; Feature not supported for this measurement”</td></tr>
<tr><td>Preset</td><td><table>

Annotation	In the Meas Bar, if the Standard path is chosen: µW Path: Standard If Low Noise Path is enabled but the LNP switch is not thrown: µW Path: LNP,Off If the Low Noise Path is enabled and the LNP switch *is* thrown: µW Path: LNP,On If the preselector is bypassed: µW Path: Bypass If Full Bypass Enable is selected but the LNP switch is not thrown: µW Path: FByp,Off If Full Bypass Enable is selected and the LNP switch *is* thrown: µW Path: FByp,On

µW Path Control Auto

In VMA, WLAN, 5G NR, CQM Modes, an **Auto/Man** switch is added to **µW Path Control**:

This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

Measurement	µW Path Control Auto behavior
Digital Demod	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Custom OFDM	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Measurement	µW Path Control Auto behavior
ACP	Always Presel Bypass
SEM	Always Presel Bypass
Spurious Emissions	Always Standard Path

WLAN Mode

Measurement	µW Path Control Auto behavior
Modulation Analysis	Always Presel Bypass
Spectral Flatness	Always Presel Bypasss
Power vs Time	Always Presel Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Always Presel Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Always Presel Bypass
SEM	For 11be 320M, when ‘Enabled Wideband IF for FFT’ is OFF or ‘Sweep Type Rule’ is Best Dynamic Range, auto µW path is standard For other cases, auto µW path is presel bypass if presel bypass is enabled, auto µW path is standard if presel bypass is not enabled
Spurious Emissions	Always Standard Path

5G NR Mode

Measurement	µW Path Control Auto behavior
Modulation Analysis	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Channel Power	Always Standard Path
Occupied BW	Always Standard Path
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Standard Path
SEM	Always Standard Path
Spurious	Always Standard Path

Measurement	µW Path Control Auto behavior
Emissions	
Transmit On|Off Power	Use Standard Path unless tuned frequency > 3.6 GHz and Info BW > 15 MHz, in which case choose Preselector Bypass

Channel Quality Mode

Measurement	µW Path Control Auto behavior
Group Delay	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Remote Command	`[:SENSe]:POWer[:RF]:MW:PATH:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:MW:PATH:AUTO?`
Example	`:POW:MW:PATH:AUTO ON` `:POW:MW:PATH:AUTO?`
Dependencies	Only appears in VMA, WLAN, 5G NR and CQM Modes
Couplings	See "µW Path Control Auto" on page 541 above
Preset	ON
Range	ON|OFF

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used,

whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

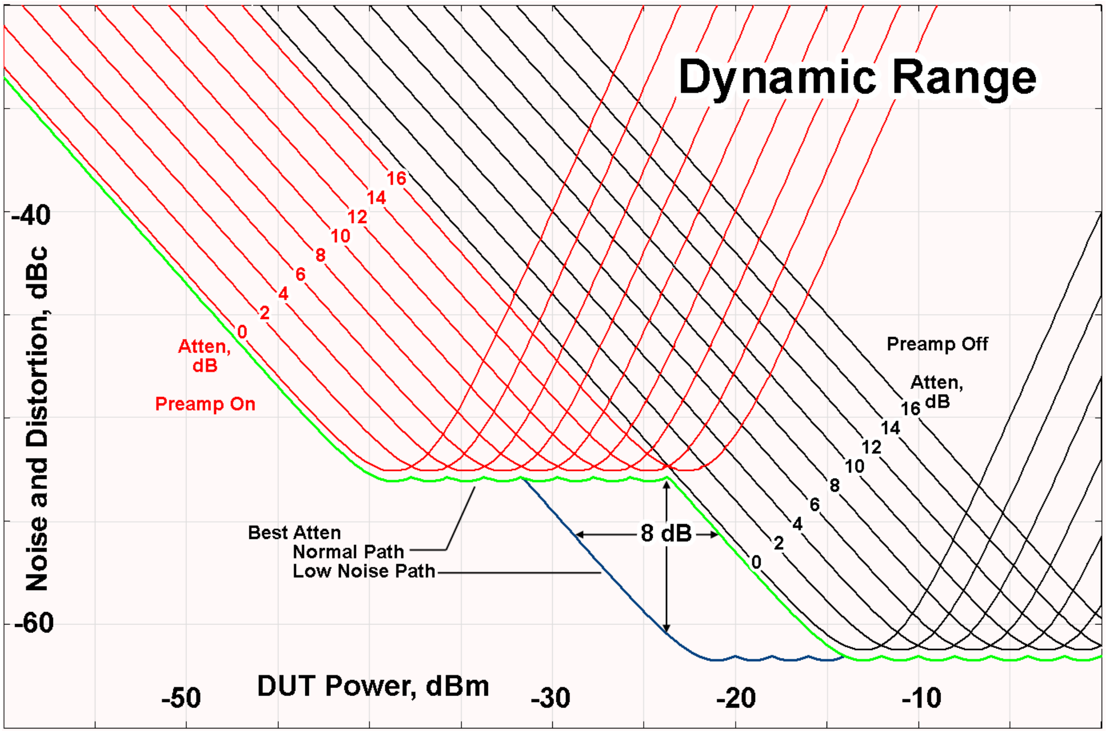
Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.



There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

µW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave presel is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and "Y Scale" on page 2153 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently,

whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

Microwave Preselector Bypass Backwards Compatibility

Example	Bypass the microwave preselector: `:POW:MW:PRES OFF`
Notes	Included for Microwave Preselector Bypass backwards compatibility The `ON` parameter sets the `STD` path (`:POW:MW:PATH STD`) The `OFF` parameter sets path `MPB` (`:POW:MW:PATH MPB`)
Preset	`ON`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON | OFF | 0 | 1` `[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?`

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender's preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is `OFF`, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

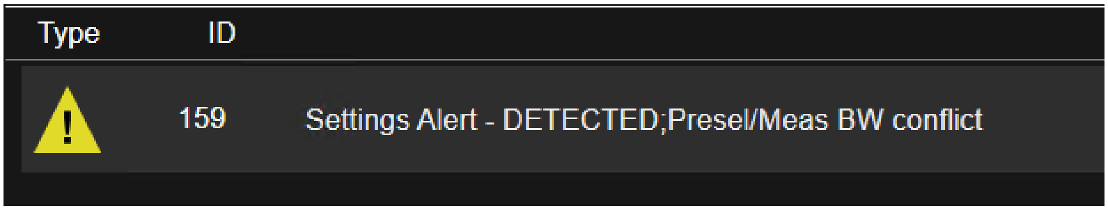
An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert;Presel/Meas BW conflict

Settings Alert message in the error queue

.



Type	ID	
⚠	159	Settings Alert - DETECTED;Presel/Meas BW conflict

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A/15A/16A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection `ON` at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:STATe 0 | 1 | ON | OFF` `[:SENSe]:POWer[:RF]:SWPresel:STAT?`
Example	`:POW:SWPR:STAT 1` `:POW:SWPR:STAT?`
Dependencies	Only appears in N9041B, N9042B+V2050A, VXT models M9410A/11A and M9410E/11E. Does not appear in all measurements
Couplings	Affects **Sweep Time** **Auto Tune** supports **Software Preselection**, so **Auto Tune** should be performed after setting the **Software Preselection** state
Preset	N9041B: `OFF` N9042B+V3050A: `ON` M9410A/11A: `ON`
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by 2 * IF / N. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- `NORMal` - mathematically removes all image and multiple responses of signals present at the input
- `ADVanced` - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel NORMal | ADVanced` `[:SENSe]:POWer[:RF]:SWPResel?`
Example	`:POW:SWPR NORM` `:POW:SWPR?`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 2195 is `OFF`. The grayout message is “Unavailable unless SW Presel enabled”
Preset	N9041B: `ADVanced` N9042B+V3050A: `NORMal`
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- `NORMal` – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for `NARRow` (below)
- `NARRow`– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from

wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:BW NORMal | NARRow` `[:SENSe]:POWer[:RF]:SWPResel:BW?`
Example	`:POW:SWPR:BW NARR`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 2195 is `OFF`. The grayout message is “Unavailable unless SW Presel enabled” For N9042B+V3050A, the parameter is SCPI-only, and always set to `NARRow` when **Software Preselection** is enabled
Preset	N9041B: `NORMal` N9042B+V3050A: `NARRow`
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A and M9410E/11E in bypass frequency range (1310MHz~5GHz), the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the “Prefilter” bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	`[:SENSe]:<measurement>:PFILter[:STATe] ON | OFF | 1 | 0` `[:SENSe]:<measurement>:PFILter[:STATe]?`

Example	Enable High Freq Prefilter for the Complex Spectrum Measurement in `BASIC` Mode:
	`:SPEC:PFIL ON`
	Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes:
	`:WAV:PFIL ON`
	Enable High Freq Prefilter for the Swept SA Measurement in `SA` Mode:
	`:SAN:PFIL ON`

Dependencies	Only appears in VXT models M9410A/11A with center frequency above 1310 MHz, and M9410E/11E in frequency range 1310MHz~5GHz
Preset	See "Prefilter Presets" on page 552 below

State Saved	Saved in instrument state

Prefilter Presets

Meas	Mode	Preset
SPEC	BASIC	OFF
WAV	BASIC, WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
MON	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF

HARM	SA	ON

3.4.9 BW

Opens the BW menu, which contains controls for the Resolution Bandwidth and Video Bandwidth functions of the instrument.

The Resolution BW functions control filter bandwidth and filter type. There are two filter types, Gaussian and Flattop. The Gaussian filters have a response curve that is parabolic on a log scale. The Flattop filter shape is a close approximation of a rectangular filter.

3.4.9.1 Settings

Contains the basic Bandwidth functions. In most measurements it is the only tab under Bandwidth.

Res BW

Activates the resolution bandwidth active function, which allows you to manually set the resolution bandwidth (RBW) of the instrument.

Normally, **Res BW** (**Auto**) selects automatic coupling of **Res BW** to "Span" on page 569. To decouple the resolution bandwidth, press the **Auto/Man** toggle on the **Res BW** control, or simply enter a different value for **Res BW**.

When **Res BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on the **Res BW** control. This may also be done by pressing "Auto Couple" on page 2242 or by performing a **Preset**.

For more Mode-specific details, see: "More Information" on page 554

<table>
<tr><td>Remote Command</td><td><code>[:SENSe]:ACPower:BANDwidth[:RESolution] <bandwidth></code>
<code>[:SENSe]:ACPower:BANDwidth[:RESolution]?</code></td></tr>
<tr><td>Example</td><td><code>:ACP:BAND 5 MHz</code>
<code>:ACP:BAND?</code></td></tr>
<tr><td>Notes</td><td>For numeric entries, all Res BW Types choose the nearest (arithmetically, on a linear scale, rounding up) available Res BW to the value entered
The setting and querying of values depend on the current bandwidth type
This parameter is preset by "Meas Method" on page 582. Preset values are:
<table>
<tr><th>Modes</th><th>Values</th></tr>
<tr><td>5GNR, LTEAFDD/TDD, MSR, VMA, SRCOMM</td><td>IBW 100 kHz
IBWR 30 kHz</td></tr>
<tr><td>SA</td><td>IBW 220 kHz
IBWR 30 kHz</td></tr>
<tr><td>WCDMA</td><td>IBW 100 kHz
IBWR 27 kHz
FAST 390 kHz</td></tr>
</table>
When Meas Method is <code>FPOWer</code> and Fast Power RBW mode is “Best Speed,” RBW is calculated as follows:
RBW = Span × 2.442 × 10^{-3}</td></tr>
<tr><td>Dependencies</td><td>Disabled when Meas Method is <code>RBW</code>, <code>FAST</code>, or <code>FPOWer</code>, and Fast Power RBW mode is Best Speed
If pressed, an advisory message is generated. If the equivalent SCPI command is sent, a "Setting conflict" warning is generated</td></tr>
<tr><td>Couplings</td><td>Sweep time is coupled to RBW. As RBW changes, the sweep time (if set to Auto) is changed to maintain amplitude calibration
"Video BW" on page 555 is coupled to Res BW. As the resolution bandwidth changes, the video bandwidth (if set to Auto) changes to maintain the ratio of VBW/RBW (10:1)</td></tr>
</table>

	When **Res BW** is set to **Auto**, the resolution bandwidth is auto-coupled to the span. The ratio of Span/RBW is approximately 106:1 when auto coupled. When **Res BW** is set to **Man**, and the bandwidths are entered manually, these bandwidths are used regardless of other instrument settings
Preset	Auto, unless noted in "RBW Presets" on page 554
State Saved	Saved in instrument state
Min	1 Hz
Max	8 MHz is the max equivalent –3 dB RBW, which means that the named RBW (the one shown on the control etc.) can actually exceed 8 MHz if using a filter other than –3 dB Gaussian
Annotation	A “#” mark appears before “RBW” in the annotation when it is switched from Auto to Manual coupling
Backwards Compatibility Notes	For backwards compatibility, this command accepts both the `BANDwidth` and `BWIDth` forms For ESA, the maximum Res BW was 5 MHz; for X-Series it is 8 MHz The following command is supported [:SENSe]:ACP:SWEep:BANDwidth|BWIDth[:RESolution]

Auto Function

Remote Command	`[:SENSe]:ACPower:BANDwidth[:RESolution]:AUTO ON | OFF | 1 | 0` `[:SENSe]:ACPower:BANDwidth[:RESolution]:AUTO?`
Example	`:ACP:BAND:AUTO ON` `:ACP:BAND:AUTO?`
Preset	See "RBW Presets" on page 554

RBW Presets

Unless noted in the table below, the Preset value of **Res BW** is **Auto**.

Mode	Preset Value
WCDMA	100 kHz
MSR	100 kHz
SA	220 kHz
5GNR	100 kHz

More Information

When **Res BW** is set to **Auto**, the bandwidth selected depends on "RBW Filter Type" on page 556.

Only certain discrete resolution bandwidths are available. The available bandwidths are dependent on the **RBW Filter Type** or the **EMC Standard**. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

In some PowerSuite measurements, in the LTE-Advanced (both FDD and TDD) Modes, when **Res BW** is **Auto**, the resolution bandwidth is predefined based on the corresponding bandwidth of the single LTE carrier, as shown in the table below. In the Multi-carrier case, the narrowest **Res BW** among the active carriers is used.

LTEAFDD, LTEATDD Modes

Carrier BW	Auto Res BW, kHz
1.4 MHz	51
3 MHz	51
5 MHz	100
10 MHz	100
15 MHz	100
20 MHz	100
200 kHz (NB-IoT in FDD)	10

5G NR Mode

100 kHz for all carrier bandwidths.

Video BW

Lets you change the instrument post-detection filter (VBW or “video bandwidth”) from 1 Hz to 8 MHz in approximately 10% steps. In addition, a wide-open video filter bandwidth may be chosen by selecting 50 MHz. The VBW is annotated at the bottom of the display, in the center.

Normally, **Video BW (Auto)** selects automatic coupling of the Video BW to "Res BW" on page 553. To decouple the resolution bandwidth, press the **Auto/Man** toggle on the **Video BW** control, or simply enter a different value for **Video BW**.

When the **Video BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on the **Video BW** control. This may also be done by pressing "Auto Couple" on page 2242 or by performing a **Preset**.

For more information, see "VBW Presets" on page 556

Remote Command	`[:SENSe]:ACPower:BANDwidth:VIDeo <bandwidth>` `[:SENSe]:ACPower:BANDwidth:VIDeo?`
Example	`:ACP:BAND:VID 2.4 MHz` `:ACP:BAND:VID?`
Notes	For numeric entries, the instrument chooses the nearest (arithmetically, on a linear scale, rounding up) available VBW to the value entered. The 50 MHz VBW is defined to mean “wide open” The values shown in this table reflect the conditions after **Mode Preset**
Dependencies	Sometimes the displayed **Video BW** is not actually used to process the trace data: – When the Average Detector is selected and **Sweep Type** is set to **Swept**, the video bandwidth filter

	cannot be used, because it uses the same hardware as the Average Detector – When the Quasi-Peak, EMI Average or RMS Average detector is selected the VBW is implemented by the digital IF as part of the detector When this is the case, the VBW still acts to change the sweep time, if **Sweep Time** is in **Auto**, and still affects the data on other traces for which this is not the case Disabled when "Meas Method" on page 582 is `RBW`, `FAST`, `FPOWer` If pressed, an advisory message is generated. If the equivalent command is sent, a "Setting conflict" warning is generated
Couplings	Video bandwidth (VBW) is normally coupled to RBW. If **VBW** is set to **Auto**, then the VBW is changed as the RBW changes, to maintain the ratio (usually 10:1)
Preset	See "VBW Presets" on page 556 below
State Saved	Saved in instrument state
Min	1 Hz
Max	50 MHz
Annunciation	A “#” mark appears before “VBW” in the annotation when it is not coupled
Annotation	In the bottom center of the screen, “VBW <value> <units>” indicates the current video bandwidth value. Note that for some detectors this is not the value actually used for VBW (see above)
Backwards Compatibility Notes	For backwards compatibility this command accepts both the `BANDwidth` and `BWIDth` forms

Auto Function

Remote Command	`[:SENSe]:ACPower:BANDwidth:VIDeo:AUTO ON | OFF | 1 | 0` `[:SENSe]:ACPower:BANDwidth:VIDeo:AUTO?`
Example	`:ACP:BAND:VID:AUTO ON`

VBW Presets

Unless noted in the table below, the Preset value of **Video BW** is **Auto**.

Mode	Preset Value
WCDMA	1 MHz

RBW Filter Type

Selects the type for the resolution bandwidth filters. Historically, the Res BW filters in HP/Agilent/Keysight spectrum analyzers were Gaussian filters, specified using the –3 dB bandwidth of the filter. That is, a 10 MHz Res BW filter was a Gaussian shape with its –3 dB points 10 MHz apart. In X-Series, the **RBW Filter BW** menu lets you choose between a Gaussian and Flat Top filter shape, for varying measurement conditions.

Filter Type	SCPI Example
Gaussian	:BAND:SHAP GAUS
Flattop	:BAND:SHAP FLAT

Remote Command	`[:SENSe]:ACPower:BANDwidth:SHAPe GAUSsian | FLATtop` `[:SENSe]:ACPower:BANDwidth:SHAPe?`
Example	`:ACP:BAND:SHAP GAUS` `:ACP:BAND:SHAP?`
Notes	`GAUSsian`= Gaussian `FLATtop` = Flattop
Dependencies	Disabled when "Meas Method" on page 582 is `FAST` or `FPOWer` If pressed, an advisory message is generated. If the equivalent command is sent, a "Setting conflict" warning is generated
Preset	"Auto Couple" on page 2242 selects the preset value
State Saved	Saved in instrument state
Annotation	The annotation under RBW in the bottom left of the screen shows the type of filter or bandwidth that is being used
Backwards Compatibility SCPI	`[:SENSe]:ACPower:BWIDth:SHAPe`

RBW Filter BW

Selects a Gaussian filter based on its –3 dB (Normal) bandwidth or its –6 dB bandwidth.

Remote Command	`[:SENSe]:ACPower:BANDwidth:TYPE DB3 | DB6` `[:SENSe]:ACPower:BANDwidth:TYPE?`
Example	`:ACP:BAND:TYPE DB3` `:ACP:BAND:TYPE?`
Dependencies	Disabled when "RBW Filter Type" on page 556 is `FLATtop` or "Meas Method" on page 582 is RBW, FAST, or Fast Power If pressed, an advisory message is generated. If the equivalent command is sent, a "Setting conflict" warning is generated
Preset	`DB3`
State Saved	Saved in instrument state
Range	–3 dB (Normal)|–6 dB
Backwards Compatibility SCPI	`[:SENSe]:ACPower:BWIDth:TYPE`

3.4.10 Display

Lets you configure display items for the current Mode, Measurement, View, or Window.

3.4.10.1 Meas Display

Contains controls for setting up the display for the current Measurement, View or Window.

Bar Graph On/Off

Turns the Bar Graph On or Off.

Remote Command	`:DISPlay:ACPower:WINDow[1]:BGRaph OFF | ON | 0 | 1` `:DISPlay:ACPower:WINDow[1]:BGRaph?`
Example	`:DISP:ACP:WIND:BGR OFF` `:DISP:ACP:WIND:BGR?`
Dependencies	Always set to ON and grayed-out when the method is RBW
Preset	ON
State Saved	Saved in instrument state
Range	OFF|ON
Backwards Compatibility SCPI	`:DISPlay:ACPower:VIEW[1]:WINDow[1]:BGRaph`

Power Results

Lets you select Power Result Type:

- `OUTer` – Results of outer offsets and carrier powers are shown in this view. Inner offset results are not shown even when Carrier Allocation is Non-Contiguous
- Outer & Inner (`OINNer`) – Results of both inner and outer offsets are shown in this view

Remote Command	`:DISPlay:ACPower:VIEW:RTYPe OUTer | OINNer` `:DISPlay:ACPower:VIEW:RTYPe?`
Example	`:DISP:ACP:VIEW:RTYP OUT` `:DISP:ACP:VIEW:RTYP?`
Dependencies	Only available in MSR, LTEAFDD, LTEATDD and 5G NR Modes

Preset	`OUTer`
State Saved	Saved in instrument state
Range	Outer | Outer & Inner

Carrier Frequency Type

Sets the carrier frequency display type:

- `OFFSet` - The carrier center frequencies are displayed as offset from Carrier Ref Freq
- `ABSolute` - The carrier center frequencies are displayed as absolute frequency

Remote Command	`:DISPlay:ACPower:VIEW:WINDow:CINFormation:FREQuency OFFSet | ABSolute` `:DISPlay:ACPower:VIEW:WINDow:CINFormation:FREQuency?`
Example	`:DISP:ACP:VIEW:WIND:CINF:FREQ ABS` `:DISP:ACP:VIEW:WIND:CINF:FREQ?`
Dependencies	Only available in MSR, LTEAFDD, LTEATDD and 5G NR Modes
Preset	`OFFSet`
State Saved	Saved in instrument state
Range	`OFFSet|ABSolute`

3.4.10.2 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	`:DISPlay:GRATicule[:STATe] OFF | ON | 0 | 1` `:DISPlay:GRATicule[:STATe]?`
Example	`:DISP:GRAT OFF`
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	`ON`
State Saved	Saved in instrument state

Backwards Compatibility SCPI	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF | ON | 0 | 1`
	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?`
	This command is accepted for backwards compatibility with older instruments, but the `WINDow`, `TRACe` and `GRID` parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When `OFF`, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	`:DISPlay:ANNotation:SCReen[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:SCReen[:STATe]?`
Example	`:DISP:ANN:SCR OFF`
Dependencies	Grayed-out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with ….

Remote Command	`:DISPlay:ANNotation:TRACe[:STATe] ON | OFF | 1 | 0` `:DISPlay:ANNotation:TRACe[:STATe]?`
Example	`:DISP:ANN:TRAC OFF`
Preset	`OFF`
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	`:DISPlay:ACTivefunc[:STATe] ON | OFF | 1 | 0` `:DISPlay:ACTivefunc[:STATe]?`
Example	`:DISP:ACT OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	`:DISPlay:ANNotation:MBAR[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:MBAR[:STATe]?`
Example	`:DISP:ANN:MBAR OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. Theare three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor :SYSTem:PRESet enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are using either the `:SYSTem:KLOCk` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is `OFF`, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

Name	Command
Select User View	`:DISPlay:VIEW:ADVanced:SELect`
Rename User View	`:DISPlay:VIEW:ADVanced:REName`
Delete User View	`:DISPlay:VIEW:ADVanced:DELete`
Create User View	`:DISPlay:VIEW:ADVanced:NAME`
Select Screen	`:INSTrument:SCReen:SELect`
Delete Screen	`:INSTrument:SCReen:DELete`
Delete All But This Screen	`:INSTrument:SCReen:DELete:ALL`
Add Screen	`:INSTrument:SCReen:CREate`
Rename Screen	`:INSTrument:SCReen:REName`
Sequencer On/Off	`:SYSTem:SEQuencer`

Remote Command	`:DISPlay:ENABle OFF | ON | 0 | 1` `:DISPlay:ENABle?`
Example	`:DISP:ENAB OFF`
Couplings	`:DISP:ENAB OFF` turns Backlight `OFF` and `:DISP:ENAB ON` turns Backlight `ON`, but changing Backlight settings does *not* change the state of `:DISP:ENAB`
Preset	`ON` Set by `:SYST:DEF MISC`, but not affected by `*RST` or `:SYSTem:PRESet`
State Saved	Not saved in instrument state
Backwards Compatibility Notes	`:SYST:PRES` no longer turns on `:DISPlay:ENABle` as it did in legacy analyzers

3.4.10.3 View

Contains controls for selecting the current **View**, and for editing User Views.

View

See "Views" on page 506.

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:SELect <alphanumeric>` `:DISPlay:VIEW:ADVanced:SELect?`
Example	Select Baseband as the current View `:DISP:VIEW:ADV:SEL “Baseband”`

Notes	You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command
	For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	because “Trace Zoom” is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu
	You *cannot* use the legacy View parameter (which in this case would be `TZOom`) with `:DISP:VIEW:ADV:SEL`
	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	`:DISP:VIEW:ADV:SEL "TRACE ZOOM"`
	If the specified view is not a valid View, the query returns the error message “-224, Illegal parameter value; View with the name <alphanumeric> does not exist”
	If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated

Backwards Compatibility SCPI	The legacy node `:DISPlay:VIEW[:SELect]` is retained for backwards compatibility, but it only supports predefined views

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a “User View”.

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	`:DISPlay:VIEW:ADVanced:NAME <alphanumeric>`
Example	`:DISP:VIEW:ADV:NAME “Baseband”` Creates a new View named `Baseband` from the current View, and selects it as the current View
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If `<alphanumeric>` name already exists as a View, the error message “-224, Illegal parameter value; View <alphanumeric> already exists” is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; User View SCPI cannot be used while Display is disabled” is generated

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View’s name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	`:DISPlay:VIEW:ADVanced:REName <alphanumeric>`

Example	`:DISP:VIEW:ADV:REN “Baseband”`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` specifying the new name is already present in the list of View names, the error message “-224, Illegal parameter value; View <alphanumeric> already exists” is generated If the current View is a Predefined View, the error message “-224, Illegal parameter value; Cannot rename a Predefined View” is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete`
Example	`:DISP:VIEW:ADV:DEL`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` is not present in the list of View names, the error message “-224, Illegal parameter value; View <alphanumeric> does not exist” is generated If the current View is a Predefined View, the error message “-224, Illegal parameter value; Cannot delete a Predefined View” is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete:ALL`
Example	`:DISP:VIEW:ADV:DEL:ALL`
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy

nodes, `:DISPlay:VIEW[:SELect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:CATalog?`
Example	`:DISP:VIEW:ADV:CAT?`
Notes	Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for *all* the Views, including User Views, available for the current Measurement Example: `"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"` No distinction is made between Predefined and User Views If you switch measurements with the display disabled (via `:DISP:ENAB OFF`), then query the list of available Views, the result is undefined

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:USER:CATalog?`
Example	`:DISP:VIEW:ADV:USER:CAT?`
Notes	Returns a quoted string of the available User Views for the current measurement, separated by commas. Example: `"Baseband,myView1,yourView1"` If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 2211), then query the list of available Views, the result is undefined

3.4.11 Frequency

Contains controls that allow you to control the Frequency and Channel parameters of the instrument.

Some features in the **Frequency** menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset. For example, the

Center Frequency setting is the same for all measurements - it does not change as you change measurements.

3.4.11.1 Settings

Contains controls that pertain to the X-Axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Carrier Reference Frequency

The center frequencies of carriers are defined as offsets from the **Carrier Reference Frequency** value. This frequency is also the reference for carrier configuration preset.

Because LTEAFDD, LTEATDD, MSR and 5G NR measurements often deal with multiple carriers with distinct bandwidths, the simple Center Frequency parameter used in most measurements does not apply here. Instead, the Carrier Reference Frequency is the key parameter. This must be distinct from the **Center Frequency** parameter used in other measurements, because **Center Frequency** can be a global parameter, and it would not make sense for **Carrier Reference Frequency** to take on this global value.

In LTEAFDD, LTEATDD and 5G NR Modes, if the following conditions are satisfied at the same time:

- **Number of Component Carriers** is 1
- Center Freq Offset is 0 Hz
- mode of **Center Frequency** is Auto

then **Center Frequency** is equivalent to **Carrier Reference Frequency**. When **Center Frequency** changes in such conditions, the mode of **Center Frequency** remains as Auto, and **Carrier Reference Frequency** changes to the same value. The major purpose of this coupling is to maintain backwards compatibility with legacy LTE/LTE TDD, in which :`SENSe:FREQuency:CENTer` is used to set up the frequency of the measurement.

See "More Information" on page 568.

Remote Command	For LTEAFDD, LTEATDD, 5G NR Modes:
	`[:SENSe]:CCARrier:REFerence <freq>`
	`[:SENSe]:CCARrier:REFerence?`
	For MSR Mode:
	`[:SENSe]:CARRier:REFerence <freq>`

	`[:SENSe]:CARRier:REFerence?`

Example	For LTEAFDD, LTEATDD, 5G NR Modes:
	`:CCAR:REF 2GHz`
	`:CCAR:REF?`
	For MSR Mode:
	`:CARR:REF 2GHz`
	`:CARR:REF?`

Dependencies	Only available in LTEAFDD, LTEATDD, 5G NR and MSR Modes
Preset	1GHz
State Saved	Saved in instrument state
Min/Max	Depends on instrument minimum/maximum center frequency

More Information

In most applications, **Center Frequency** is generally where the carrier center is located at and thus plays a very important role. However, in LTEAFDD and LTEATDD Modes, the measurements are done based on carrier center frequencies and its bandwidths, both of which are calculated or obtained according to the carriers' configuration.

The **Center Frequency** defined here is only for the Monitor Spectrum, IQ Waveform and CCDF measurements, because these three are general type measurements and focus on a certain frequency range, which may be the entire BS RF bandwidth, a frequency range of one of the component carriers or a range far away from the component carriers to see spurious. The **Center Frequency** in these three measurements has a different meaning, therefore it should be a separate setting from Carrier Reference Frequency.

Carrier center frequencies are defined using offsets from Carrier Reference Frequency which determines absolute frequency locations, which can be set as both absolute and relative frequency from the carrier reference frequency.

Since **Center Frequency** is only used in those three measurements, Monitor Spectrum, IQ Waveform and CCDF, this control only appears on the **Frequency** menu of these measurements.

When the mode of **Center Frequency** is Auto, **Number of Component Carriers** is 1, and **Center Frequency Offset** is 0 Hz, the Center Frequency is equivalent to Carrier Reference Frequency, which is used to set up the Frequency of all the measurements.

Span

Changes the displayed frequency range symmetrically about **Center Frequency**. While adjusting **Span**, **Center Frequency** is held constant, which means that both start and stop frequencies will change.

If **Span** is set to a value greater than the maximum allowable span of the instrument, an error message is generated indicating the data is out of range and was clipped to upper limit.

The default (and minimum) **Span** is calculated using the number of carriers and the carrier width where;

Span = (Upper Carrier Freq + (max offset IBW * (1 + alpha)) / 2) - (Lower Carrier Freq - (max offset IBW * (1 + alpha)) / 2)

Span is increased by a factor of 1 + Filter Alpha if the RRC Filter in on.

Remote Command	`[:SENSe]:ACPower:FREQuency:SPAN <freq>` `[:SENSe]:ACPower:FREQuency:SPAN?`
Example	`:ACP:FREQ:SPAN 10 MHz` `:ACP:FREQ:SPAN?`
Notes	In Bluetooth Mode, the value of **Span** has to be an odd MHz
Dependencies	If the electrical attenuator is enabled, any attempt to set **Span** such that the Stop Frequency would be >3.6 GHz results in an error In instruments with an RF Preselector, such as MXE, you cannot sweep across the band break at 3.6 GHz while the RF Preselector is on in **Continuous** sweep, as there is a mechanical switch that bypasses the RF Preselector above 3.6 GHz
Couplings	**Span** affects RBW, sweeptime, FFT & Sweep choice (including FFT Width, Phase Noise Optimization and ADC Dither auto couplings) – Any value of **Center Frequency** or **Span** that is within the frequency range of the instrument is allowed *when* the value is being set through the front panel numeric keypad or the SCPI command. The other parameter is forced to a different value if needed, to keep the start and stop frequencies within the instrument's frequency range – When using the knob or the step up/down keys or the `UP` | `DOWN` keywords in SCPI, the value that is being changed, that is, **Center Frequency** or **Span**, is limited so that the other parameter is not forced to a new value – In Bluetooth Mode, if **Meas Method** is FFT, the max value of **Span** is coupled to the MAX IFBW of the platform The **Span** value is clipped when the carrier settings and/or the offset settings are changed. The value is changed to satisfy following formula: **Span** = (Upper Carrier Freq + (max offset IBW * (1 + alpha)) / 2) - (Lower Carrier Freq - (max offset IBW * (1 + alpha)) / 2)

	This parameter is unavailable when **Meas Method** is Fast Power. In that case, the span is fixed by the formula above
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See "Span Presets" on page 570
State Saved	Saved in instrument state
Min/Max	Depends on instrument maximum frequency, mode, measurement, and selected input. See "Span Presets" on page 570
Annotation	Span <value> appears on the first line of the annotation in the lower right corner of display

Span Presets

The following table provides the Max Span, for the various frequency options:

Freq Option	Max Span (can't set higher than this)
503 (all but CXA)	3.7 GHz
503, F03 (CXA, CXA-m)	3.08 GHz
507 (all but CXA)	7.1 GHz
507 (CXA, CXA-m)	7.575 GHz
508 (all but MXE)	8.5 GHz
508 (MXE)	8.5 GHz
513, F13	13.8 GHz
526 (all but CXA and MXE)	27.0 GHz
526 (MXE)	27.0 GHz
526, F26 (CXA, CXA-m)	26.55 GHz
544	44.5 GHz
550	52 GHz
F06 & EP6 (VXT models M9410A/11A)	6.27 GHz
F06 & LFE & EP6 (VXT models M9411A)	6.5999935 GHz
M9415A-F06	6.27 GHz
M9415A-F08	8.27 GHz
M9415A-F12	12.57 GHz

Input 2:

Model	Max Span (can't set higher than this)
CXA opt C75	1.58 GHz
MXE	1.000025 GHz

Note that if you are in External Mixing, the maximum Span will be equal to the Maximum Stop Frequency – Minimum Start Frequency for the currently selected mixer.

Span Presets by Mode

Mode	Preset Value
SA	8 MHz
WCDMA	24.6848 MHz
LTE, LTETDD, LTEAFDD, LTEATDD, MSR	25 MHz
5G NR	500 MHz
Radio Test	175 kHz

3.4.12 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, **Marker** selects marker 1, sets it to `POSition` (Normal) and places it at the center of the display. If the selected marker is `OFF`, it is set to `POSition` and placed at the center of the screen on the trace determined by the **Marker Trace** rules.

Note that this hard key and all sub keys are unavailable when "Meas Method" on page 582 is RBW.

3.4.12.1 Select Marker

Specifies the selected marker. The term “selected marker” is used throughout this document to specify which marker will be affected when you change marker settings, perform a Peak Search, etc.

The **Select Marker** control appears above the menu panel, indicating that it applies to all controls in the **Marker** menu panels. **Select Marker** is blanked if you select a tab whose controls do *not* depend on the selected marker (for example, **Counter**).

On any menu tab in which **Select Marker** appears, the first control is always **Marker Frequency | Time**.

Notes	The selected marker is remembered even when not in the Marker menu and is used if a Search is done or a Band Function is turned on or for Signal Track or Continuous Peak
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for **Normal, Delta** and **Fixed** markers

3.4.12.2 Settings

The controls on this tab include the **Marker** active function and a radio button selection of the marker control mode (`POSition`, `DELTa`, or `OFF`) for the selected marker, as well as additional functions that help you use markers.

Marker Frequency

Sets the marker X-Axis value in the current marker X-Axis Scale unit. Has no effect if the control mode is `OFF`, but is the SCPI equivalent of entering an X value if the control mode is `POSition` or `DELTa`.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|…|12:X <freq>` `:CALCulate:ACPower:MARKer[1]|2|…|12:X?`
Example	`:CALC:ACP:MARK3:X 0` `:CALC:ACP:MARK3:X?`
Notes	If no suffix is sent, uses the fundamental units for the current marker X-Axis Scale. If a suffix is sent that does not match the current marker X-Axis Scale unit, an error “Invalid suffix” is generated The query returns the marker’s absolute X Axis value if the control mode is `POSition`, or the offset from the marker’s reference marker if the control mode is `DELTa`. The query is returned in the fundamental units for the current marker X-Axis scale: Hz for **Frequency and Inverse Time**, seconds for **Period and Time**
Dependencies	Unavailable when "Meas Method" on page 582 is `RBW`
Preset	After a preset, all markers are turned `OFF`, so the query returns Not A Number (`NAN`)
State Saved	Saved in instrument state
Min/Max	–/+9.9E+37
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Marker X Axis Position (Remote Command Only)

Sets the marker X-Axis Scale position in trace points. This setting has no effect if the control mode is `OFF`, but is the SCPI equivalent of entering a value if the control mode is `POSition` or `DELTa`, except in trace points rather than X-Axis Scale units. The entered value is immediately translated into the current X-Axis Scale units for setting the value of the marker.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|…|12:X:POSition <real>` `:CALCulate:ACPower:MARKer[1]|2|…|12:X:POSition?`
Example	`:CALC:ACP:MARK10:X:POS 0` `:CALC:ACP:MARK10:X:POS?`
Notes	The query returns the marker’s absolute X-Axis value in trace points if the control mode is

	`POSition`, or the offset from the marker's reference marker in trace points if the control mode is `DELTa`. The value is returned as a real number, not an integer, corresponding to the translation from X-Axis Scale units to trace points. When a Marker is turned on, it is placed center of the screen on the trace. Therefore, the default value depends on instrument condition. If the marker is `OFF`, the response is Not A Number
Dependencies	Unavailable when **Meas Method** is RBW
Preset	After a preset, all markers are turned `OFF`, so the query returns Not A Number (`NAN`)
State Saved	Saved in instrument state
Min	-9.9E+37
Max	9.9E+37

Marker Y Axis Value (Remote Query only)

Returns the marker Y-Axis value in the current marker Y-Axis unit.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|…|12:Y?`
Example	`:CALC:ACP:MARK11:Y?`
Notes	Returns the marker Y-axis result, if the control mode is `POSition` or `DELTa`. If the marker is `OFF`, the response is Not A Number
Dependencies	Unavailable when "Meas Method" on page 582 is `RBW`
Preset	Depends on Markers setup and signal source
State Saved	No
Backwards Compatibility SCPI	`:CALCulate:ACPower:MARKer[1]|2|…|12:FUNCtion:RESult?`

Marker Mode

Sets the marker control mode to `POSition` (**Normal**), `DELTa`, or `OFF`. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is `OFF`, pressing **Marker** sets it to `POSition`, and places it at the center of the screen on the trace determined by the **Marker Trace** rules. At the same time, **Marker X Axis Value** appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is `OFF`, there is no active function, and the active function is turned off.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|…|12:MODE POSition | DELTa | OFF` `:CALCulate:ACPower:MARKer[1]|2|…|12:MODE?`
Example	`:CALC:ACP:MARK3:MODE POS`

	`:CALC:ACP:MARK3:MODE?`
Dependencies	Unavailable when **Meas Method** is `RBW`
Preset	`OFF`
State Saved	Saved in instrument state
Range	`POSition|DELTa|OFF`
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Backwards Compatibility SCPI Commands

Sets or queries the state of a marker. Setting a marker that is `OFF` to `ON` (1) puts it in `POSition` mode and places it at the center of the screen.

Example	`:CALC:ACP:MARK2:STAT ON` `:CALC:ACP:MARK2:STAT?`
Preset	`OFF`
State Saved	Saved in instrument state
Range	`OFF|ON`
Backwards Compatibility SCPI	`:CALCulate:ACPower:MARKer[1]|2|…|12:STATe OFF | ON | 0 | 1` `:CALCulate:ACPower:MARKer[1]|2|…|12:STATe?`

Delta Marker (Reset Delta)

Pressing this button has exactly the same effect as pressing `DELTa` in **Marker Mode**. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the delta to zero.

Marker Settings Diagram

Lets you configure the **Marker** system using a visual utility.

All Markers Off

Turns off all markers.

Remote Command	`:CALCulate:ACPower:MARKer:AOFF`
Example	`:CALC:ACP:MARK:AOFF`
Dependencies	Unavailable when "Meas Method" on page 582 is `RBW`

Couple Markers

When this function is `ON`, moving any marker causes an equal X-Axis movement of every other marker that is not `OFF`. By “equal X-Axis movement” we mean that we preserve the difference between each marker’s X-Axis value (in the fundamental X-Axis units of the trace that marker is on), and the X-Axis value of the marker being moved (in the same fundamental X-Axis units).

This may result in markers going off screen.

Remote Command	`:CALCulate:ACPower:MARKer:COUPle[:STATe] ON | OFF | 1 | 0` `:CALCulate:ACPower:MARKer:COUPle[:STATe]?`
Example	`:CALC:ACP:MARK:COUP ON` `:CALC:ACP:MARK:COUP?`
Dependencies	Unavailable when "Meas Method" on page 582 is `RBW`
Preset	`OFF` Presets on **Mode Preset** and **All Markers Off**
State Saved	Saved in instrument state

3.4.12.3 Peak Search

The controls on this tab allow you to move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with the Delta Marker function.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the Peak Search page of the **Marker** menu *and* performs a Peak Search.

Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a Peak Search.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as "Marker Frequency" on page 572on the **Settings** tab.

Peak Search

Pressing the **Peak Search** control moves the selected marker to the trace point which has the maximum Y-Axis value for that marker’s trace.

NOTE Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a peak search.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|…|12:MAXimum`

Example	`:CALC:ACP:MARK2:MAX`
	`:SYST:ERR?`
	can be used to query the errors to determine if a peak is found. The message “No peak found” will be returned after an unsuccessful search

Notes	Sending this command selects the subopcoded marker

Next Peak

Moves the selected marker to the peak that is next lower in amplitude than the current marker value.

If the selected marker was `OFF`, then it is turned on as a normal marker and a peak search is performed.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|…|12:MAXimum:NEXT`
Example	`:CALC:ACP:MARK2:MAX:NEXT`
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Next Pk Right

Moves the selected marker to the nearest peak right of the current marker.

If the selected marker was `OFF`, then it is turned on as a normal marker and a peak search is performed.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|…|12:MAXimum:RIGHt`
Example	`:CALC:ACP:MARK2:MAX:RIGH`
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Next Pk Left

Moves the selected marker to the nearest peak left of the current marker.

If the selected marker was `OFF`, then it is turned on as a normal marker and a peak search is performed.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|…|12:MAXimum:LEFT`
Example	`:CALC:ACP:MARK2:MAX:LEFT`
State Saved	Not part of saved state

Minimum Peak

Moves the selected marker to the minimum Y-Axis value on the current trace.

If the selected marker is `OFF`, it is turned on before the minimum search is performed.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|…|12:MINimum`
Example	`:CALC:ACP:MARK:MIN`
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Pk-Pk Search

Finds and displays the amplitude and frequency (or time, if in zero span) differences between the highest and lowest Y-Axis value. It places the selected marker on the minimum value on its selected trace, and places that marker’s reference marker on the peak of its selected trace.

This function turns on the reference marker and sets its mode to `POSition` if it is not already on. (These markers may be on two different traces.)

If the selected marker is `OFF`, a delta type marker is turned on and the peak-to-peak search is done. If the selected marker is on, but it is not a delta marker, then it is changed to delta, which turns on the reference marker if needed, and then it performs the peak-to-peak function.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|…|12:PTPeak`
Example	`:CALC:ACP:MARK:PTP`
Notes	Turns on the Marker D active function Sending this command selects the subopcoded marker
Dependencies	**Pk-Pk Search** is not available when **Coupled Markers** is on
Couplings	The selected marker becomes a delta marker if not already in delta mode
State Saved	Not part of saved state

Marker Delta

Pressing this button has exactly the same effect as pressing `DELTa` in **Marker Mode** on the **Settings** tab. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the delta to zero.

The control is duplicated here to allow you to conveniently perform a peak search and change the marker's control mode to **Delta** without having to access two separate menus.

3.4.12.4 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as "Marker Frequency" on page 572 on the **Settings** tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the "reference marker" for that marker. This attribute is set by the **Marker, Properties, Relative To** key. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|…|12:REFerence <integer>` `:CALCulate:ACPower:MARKer[1]|2|…|12:REFerence?`
Example	`:CALC:ACP:MARK2:REF 6` `:CALC:ACP:MARK2:REF?`
Notes	Causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded the value is clipped A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: "Settings conflict; marker cannot be relative to itself" When queried a single value is returned (the specified marker numbers relative marker)
Dependencies	Unavailable when "Meas Method" on page 582 is `RBW`
Couplings	If the reference marker is `OFF`, it is turned on in `POSition` mode at the delta marker location

Preset	The preset default “Relative To” marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then its default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by using **Restore Mode Defaults.** This is not reset by **Marker Off**, **All Markers Off**, or **Preset**
State Saved	Saved in instrument state. Not affected by **Marker Off** and hence not affected by **Preset** or power cycle
Min	1
Max	12
Annunciation	Appears in the marker label of a **Delta** marker

Marker Trace

Selects the trace on which you want your marker placed. A marker is associated with one and only one trace. This trace is used to determine the placement, result, and X-Axis Scale of the marker. All markers have an associated trace; it is from that trace that they determine their attributes and behaviors, and it is to that trace that they go when they become Normal markers.

Specifying a **Marker Trace** manually or with this command associates the marker with the specified trace. If the marker is not `OFF`, it moves the marker from the trace it was on to the new trace. If the marker is `OFF`, it stays off but is now associated with the specified trace.

The query returns the number of the trace on which the marker is currently placed.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|…|12:TRACe 1 | 2 | 3` `:CALCulate:ACPower:MARKer[1]|2|…|12:TRACe?`
Example	`:CALC:ACP:MARK2:TRAC 2` `:CALC:ACP:MARK2:TRAC?`
Notes	A marker may be placed on a blanked and/or inactive trace, even though the trace is not visible and/or updating An application may register a trace name to be displayed on the control instead of a trace number
Couplings	The state of **Marker Trace** is not affected by "Auto Couple" on page 2242 Sending the remote command causes the addressed marker to become selected
Preset	1
State Saved	Saved in instrument state
Min	1
Max	3

Marker Settings Diagram

Lets you configure the **Marker** system using a visual utility. It is the same as "Marker Settings Diagram" on page 574 on the **Settings** tab.

3.4.13 Meas Setup

Contains functions for setting up the measurement parameters, and for setting up parameters global to all measurements in the Mode.

3.4.13.1 Settings

Contains frequently-used functions to which you will want the fastest access.

Avg | Hold Number

Specifies the number of measurement averages used to calculate the measurement result. The average will be displayed at the end of each sweep. After the specified number of average counts, the average mode (termination control) setting determines the average action.

Remote Command	`[:SENSe]:ACPower:AVERage:COUNt <integer>` `[:SENSe]:ACPower:AVERage:COUNt?`
Example	`:ACP:AVER:COUN 250` `:ACP:AVER:COUN?`
Notes	The BAF backwards Compatibility SCPI command, `[:SENSe]:ACPR:AVERage[:STATe]`, is provided to support same functionality as `[:SENSe]:ACPr:AVERage[:STATe]` (PSA W-CDMA, PSA cdma2000 and PSA 1xEVDO) due to ACPr node conflicts with ACPower node
Preset	10
State Saved	Saved in instrument state
Min/Max	1/1000
Annotation	Avg Number is displayed in the Measurement Bar

Backwards Compatibility SCPI	`[:SENSe]:ACPR:AVERage:COUNt`
	`[:SENSe]:MCPower:AVERage:COUNt`
	Power Suite, W-CDMA

Averaging On/Off

Turns averaging on or off.

NOTE In this measurement, the **Average Type** is preset to the `Log-Pwr Avg (Video)` method. Other averaging methods are not available.

Remote Command	`[:SENSe]:ACPower:AVERage[:STATe] OFF | ON | 0 | 1` `[:SENSe]:ACPower:AVERage[:STATe]?`
Example	`:ACP:AVER OFF` `:ACP:AVER?`
Preset	`ON`
State Saved	Yes
Range	`OFF|ON`

Backwards Compatibility SCPI	`[:SENSe]:ACPR:AVERage[:STATe]`
	`[:SENSe]:MCPower:AVERage[:STATe]`
	Power Suite, W-CDMA

Avg Mode

Sets the Averaging Mode. This determines the averaging action after the specified number of data acquisitions (average count) is reached.

- When set to `EXPonential`, the measurement averaging continues using the specified number of averages to compute each averaged value. The average will be displayed at the end of each sweep
- When set to `REPeat`, the measurement resets the average counter each time the specified number of averages is reached

Remote Command	`[:SENSe]:ACPower:AVERage:TCONtrol EXPonential | REPeat` `[:SENSe]:ACPower:AVERage:TCONtrol?`
Example	`:ACP:AVER:TCON EXP` `:ACP:AVER:TCON?`
Notes	The backwards-compatibility SCPI command, `[:SENSe]:ACPR:AVERage:TCONtrol`, is provided to support same functionality as `[:SENSe]:ACPr:AVERage:TCONtrol` (PSA W-CDMA, PSA cdma2000 and PSA 1xEVDO) due to `ACPr` node conflicts with `ACPower` node
Preset	`EXPonential`
State Saved	Saved in instrument state
Range	`EXPonential|REPeat`

Backwards Compatibility SCPI	`[:SENSe]:ACPR:AVERage:TCONtrol`
	Power Suite, W-CDMA:
	`[:SENSe]:MCPower:AVERage:TCONtrol`

Meas Method

Sets the desired method to measure ACP. The options are:

Integration BW

`IBW`

One sweep of the trace is taken, and the band power for each offset is computed. Depending on "Measurement Type" on page 676 (Total Power Reference or PSD Reference), results are displayed relative to the total power or the power spectral density. The display reflects either the current trace or a bar graph view

Filtered IBW

`IBWRange`

(max dynamic range)

The ACP Path is used to compute ACP when an ACP path is available. This method increases dynamic range, but increases measurement time as it limits the resolution bandwidth. This method is useful for improving dynamic range on a W-CDMA signal because a sharp cutoff bandpass filter is used. The accuracy of the adjacent channel power ratio is not degraded by this method, but the absolute accuracy of both adjacent channel power and carrier power are degraded by up to about 0.5 dB

RBW

`RBW`

The algorithm uses zero-span and an appropriate RBW setting to capture all of the power in the carrier channel and the offsets. The zero-span algorithm (RBW method) is slower than the IBW method, but greatly improves repeatability

Fast

`FAST`

WCDMA Mode or SA Mode with 3GPP WCDMA radio standard selected:

Provides the same method as the Integration BW method, but is optimized for speed to measure a W-CDMA signal

SA Mode with CDMA2K radio standard selected:

Provides faster measurement using the FFT method with a limited parameter flexibility. When this is selected, CDMA2K preset offsets are given and control of the following are unavailable:

- BW menu
- Sweep/Control menu except Pause/Resume
- Trace/Detector menu
- Carrier Setup, Offset Limit, RRC Weighting, Filter Alpha, and Noise Correction in Meas Setup menu

Fast Power

`FPOWer`

(Option FP2 required)

This provides faster measurement using the Hardware accelerated FFT method with a limited parameter flexibility. When this is selected, the following parameters are not available:

- Points and Auto Sweep Points under Sweep
  - When changing Meas Method to Fast Power, Auto Sweep Points is turned on and grayed-out (Sweep Points will change according to the Fast Power setting)
  - When returning Meas Method to any setting other than Fast Power, Auto Sweep Points stays on and becomes available (Sweep Points will change according to the auto sweep points calculation algorithm)
- Trace Type, Restart Averaging and View/Blank under Trace when Select Trace is Trace 2 or Trace3
- Span under Frequency
- Res BW, Video BW, Filter Type and Filter BW of Offset > Advanced dialog of Carr/Offset/Limits Config control under Meas Setup
- For Trigger, only Free Run, External 1 and External 2 are supported

When in microwave frequency and measurement span is > 40MHz, RF preselector must be turned off

Remote Command	`[:SENSe]:ACPower:METHod IBW | IBWRange | FAST | RBW | FPOWer` `[:SENSe]:ACPower:METHod?`
Example	`:ACP:METH IBW` `:ACP:METH?`
Notes	`FAST` mode is only supported for WCDMA and C2K signals. You must be in WCDMA or SA Modes, with 3GPP WCDMA or CDMA2K radio standard. Otherwise, a setting conflict error message is reported MSR, LTEAFDD, LTEATDD and 5G NR Modes support only Integration BW, Filtered IBW and Fast Power methods
Dependencies	When `RBW`, `FAST` or `FPOWer` is selected, **Gate** function is not available. If you try to turn **Gate**`ON` while **Meas Method** is `RBW`, `FAST` or `FPOWer`, an error is generated When **Gate** function is `ON`, `RBW`, `FAST` and `FPOWer` are not available. If you try to change **Meas Method** to `RBW`, `FAST` or `FPOWer`, an error is generated VXT Models M9420A/10A/11A support only the Integration BW method
Couplings	IBW (Range) restricts the **Res BW** available for making this measurement to 30 kHz. When selected, **Res BW** is clipped to this value if required and an error number displayed
Preset	`IBW`
State Saved	Saved in instrument state
Range	`IBW|IBWRange|FAST|RBW|FPOWer`

Backwards Compatibility SCPI	`[:SENSe]:ACPR:SWEep:TYPE`
	(Power Suite, WCDMA)
	`[:SENSe]:MCPower:METHod`

Carrier/Offset/Limits Config

Opens a dialog that lets you set Carriers, Offset, and Limits parameters.

Number of Carriers

This is the same as **Number of Carriers [Mode: all but LTEAFDD, LTEATDD, MSR, 5GNR]** under **Reference**.

Couple to #1

Couples carrier settings to carrier #1. The coupled parameters are:

- "Carrier Pwr Present" on page 638
- "Carrier Spacing" on page 639
- "Measurement Noise Bandwidth" on page 640
- "Method for Carrier " on page 641
- "Filter Alpha for Carrier" on page 641

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:COUPle OFF | ON | 0 | 1, …`
	`[:SENSe]:ACPower:CARRier[1]|2:LIST:COUPle?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:CARR:LIST:COUP OFF` `:ACP:CARR:LIST:COUP?`
Notes	Some modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored For LTEAFDD or LTEATDD Modes, this control is not shown. In order to maintain backwards compatibility with legacy LTE FDD/TDD, the SCPI command is supported in LTE & LTE-A converged applications
Couplings	When ON, the carrier settings are coupled to carrier #1. Coupled parameters are: Carrier Power Present, Carrier Spacing, Measurement Noise Bandwidth, Method and Filter Alpha When a setting is changed, coupling is switched off automatically Carrier #1 is always set to ON and cannot be changed
Preset	ON
State Saved	Saved in instrument state

Carrier Pwr Present

Configures the carriers for this measurement. Allows spaces to be inserted between carriers. Carriers with the power present parameter set to YES are carriers, and those with the power present parameter set to NO are spaces. Each carrier power present is set to YES or NO. The individual carrier can be set by selecting the desired carrier.

The query returns the current values for all of the carriers. If a carrier is defined as having no power present, the power displayed is relative to the reference carrier, otherwise the absolute power is displayed.

If you change the carrier power present to NO, and that carrier is currently configured as the reference carrier, the next carrier to the left (or the right if there are no carriers to the left) is assigned as the reference carrier. This also applies to the scenario where there are only two carriers configured as having power present, and you configure only one carrier to have no power present.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:PPResent YES | NO, …`
	`[:SENSe]:ACPower:CARRier[1]|2:LIST:PPResent?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:CARR2:LIST:PPR YES` `:ACP:CARR2:LIST:PPR?`
Notes	Some Modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the carrier. Missing values are not permitted, so if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged, unless the number of values sent is greater than the number of carriers, then subsequent values are ignored For LTEAFDD or LTEATDD Modes, this control is not shown. To maintain backwards compatibility with legacy LTE FDD/TDD Modes, the SCPI command is supported in the LTE & LTE-A converged applications
Couplings	Coupled to number of carriers. When the SCPI command is sent, the number of carriers is set to the number of entries in the parameter list
Preset	`YES`
State Saved	Saved in instrument state
Backwards Compatibility SCPI	`[:SENSe]:MCPower:CARRier[1]|2:LIST:PPResent`

Carrier Spacing

Sets the width of the carrier spacing. This is the value applied to all the current slots, whether they are carriers or spaces.

Enter each carrier spacing value individually by selecting the desired carrier, and then enter the carrier width.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:WIDTh <freq>, …`
	`[:SENSe]:ACPower:CARRier[1]|2:LIST:WIDTh?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:CARR2:LIST:WIDT 25kHz` `:ACP:CARR2:LIST:WIDT?`
Notes	Some Modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the carrier. Missing values are not permitted, so if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged, unless the number of values sent is greater than the number of carriers, then subsequent values are ignored For LTEAFDD or LTEATDD Modes, this control is not shown. To maintain backwards compatibility with

	legacy LTE FDD/TDD Modes, the SCPI command is supported in the LTE & LTE-A converged applications
Couplings	Coupled to number of carriers. When the SCPI command is sent, the number of carriers is set to the number of entries in the parameter list Changing Carrier Spacing might affect "Span" on page 569
Preset	SA, WCDMA, LTE, LTETDD Modes: 5 MHz Radio Test Mode: 25 kHz
State Saved	Saved in instrument state
Min/Max	0 Hz/Depends on instrument maximum frequency. Same as the Max Span of Swept SA Measurement
Backwards Compatibility SCPI	`[:SENSe]:MCPower:CARRier[1]|2:LIST:WIDTh`

Measurement Noise Bandwidth

Specifies the **Measurement Noise Bandwidth** used to calculate the power in the carriers.

Each **Measurement Noise Bandwidth** value is entered individually by selecting the desired carrier. Enter the measurement noise bandwidth on the **Carrier** page of the **Carr/Offset/Limits Config** dialog.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:BANDwidth[:INTegration] <freq>, …`
	`[:SENSe]:ACPower:CARRier[1]|2:LIST:BANDwidth[:INTegration]?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:CARR2:LIST:BAND 25kHz` `:ACP:CARR2:LIST:BAND?`
Notes	In WCDMA Mode, the preset/default value is defined as 3.84 MHz, but internally, 4.6848 MHz is used as the default value Some Modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the carrier. Missing values are not permitted, so if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged, unless the number of values sent is greater than the number of carriers, then subsequent values are ignored For LTEAFDD or LTEATDD Modes, this control is not shown. In order to maintain backwards compatibility with legacy LTE FDD/TDD Modes, the SCPI command is supported in the LTE & LTE-A converged applications
Couplings	Coupled to number of carriers. When the SCPI command is sent, the number of carriers is set to the number of entries in the parameter list

Preset	<table><tr><th>Modes</th><th>Value</th></tr><tr><td>SA</td><td>2 MHz</td></tr><tr><td>WCDMA</td><td>3.84 MHz</td></tr><tr><td>LTE, LTETDD</td><td>4.515 MHz|4.5 MHz</td></tr><tr><td>Radio Test</td><td>25 kHz</td></tr></table>
State Saved	Saved in instrument state
Min/Max	10 Hz/Depends on instrument maximum frequency. Same as Max Span of the Swept SA Measurement

Backwards Compatibility SCPI	`[:SENSe]:ACPower:BANDwidth:INTegration`
	`[:SENSe]:ACPower:BWIDth:INTegration`
	`[:SENSe]:ACPower:CARRier[1]|2:LIST:BWIDth[:INTegration]`
	`[:SENSe]:MCPower:CARRier[1]|2:LIST:BANDwidth[:INTegration]`
	`[:SENSe]:MCPower:CARRier[1]|2:LIST:BWIDth[:INTegration]`

Method for Carrier

Accesses the carrier configuration method settings.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:FILTer[:RRC][:STATe] ON | OFF | 1 | 0, …`
	`[:SENSe]:ACPower:CARRier[1]|2:LIST:FILTer[:RRC][:STATe]?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:CARR:LIST:FILT 0,0,0,0` `:ACP:CARR:LIST:FILT?`
Notes	The binary values translate as follows: <table><tr><td>1|ON</td><td>RRC Weighted</td></tr><tr><td>0|OFF</td><td>Integ BW</td></tr></table>Maximum of Array length depends on the number of carriers Some Modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored For LTEAFDD or LTEATDD Modes, this control is not shown. In order to maintain backwards compatibility with legacy LTE FDD/TDD Modes, the SCPI command is supported in the LTE & LTE-A converged applications
Preset	<table><tr><th>Modes</th><th>Value</th></tr><tr><td>SA, LTE, LTETDD</td><td>OFF</td></tr><tr><td>WCDMA</td><td>ON</td></tr><tr><td>Radio Test</td><td>OFF</td></tr></table>

State Saved	Saved in instrument state
Range	Integration BW | RRC Weighted

Filter Alpha for Carrier

Inputs the alpha value for the filter used in the current carrier configuration.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:FILTer:ALPHa <real>, …`
	`[:SENSe]:ACPower:CARRier[1]|2:LIST:FILTer:ALPHa?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:CARR2:LIST:FILT:ALPH 0.5` `:ACP:CARR2:LIST:FILT:ALPH?`
Notes	Some Modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored For LTEAFDD or LTEATDD Modes, this control is not shown. In order to maintain backwards compatibility with legacy LTE FDD/TDD Modes, the SCPI command is supported in the LTE & LTE-A converged applications
Preset	0.22
State Saved	Saved in instrument state
Min/Max	0.01/1.0

Component Carriers

Contains settings that let you configure the analyzer to match the component carriers in your LTE-A signal.

Number of Component Carriers

Specifies how many component carriers are included in LTE-Advanced TDD/FDD measurements. Each component carrier complies with the LTE specifications.

LTE-Advanced TDD/FDD supports a maximum of five component carriers, so the maximum transmission bandwidth is up to 100 MHz.

Remote Command	`[:SENSe]:CCARrier:COUNt <integer>` `[:SENSe]:CCARrier:COUNt?`
Example	`:CCAR:COUN 1` `:CCAR:COUN?`
Notes	The max number of Component carriers can be set greater than one with 9080B/9082B-2FP license

Preset	1
State Saved	Yes
Min	1
Max	5

Carrier Allocation

Specifies the carrier frequency allocation. There are two types of allocation, contiguous and non-contiguous. Non-Contiguous frequency allocation is defined as an allocation where two sub-blocks are separated with a sub-block gap:

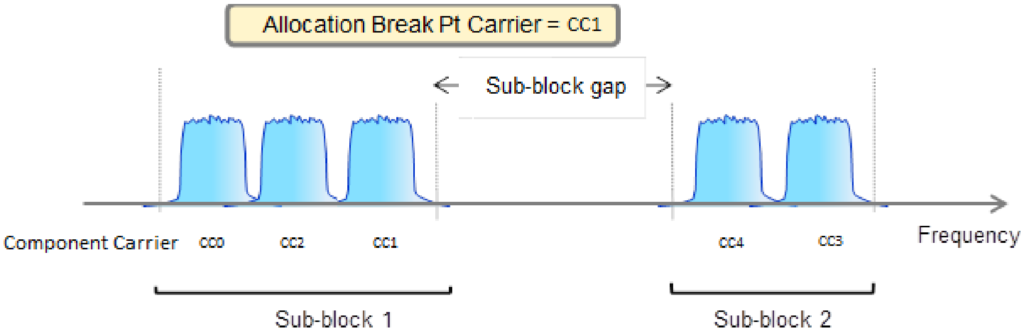
- CONTiguous – All the component carriers belong to one block and no sub-block gap exists
- NCONtiguous – Component carriers are separated into two sub-blocks. Allocation Break Pt Carrier determines how sub-blocks are configured

Remote Command	`[:SENSe]:CCARrier:CONFig:ALLocation CONTiguous | NCONtiguous` `[:SENSe]:CCARrier:CONFig:ALLocation?`
Example	`:CCAR:CONF:ALL CONT` `:CCAR:CONF:ALL?`
Preset	CONTiguous
State Saved	Saved in instrument state
Range	Contiguous|Non-Contiguous

Non-Contiguous Break at

Specifies an allocation break point in non-contiguous carrier allocation. First sub-block starts from the lowest frequency carrier and stops at the allocation break point carrier. Next sub-block starts from the next upper frequency carrier and ends at the highest frequency carrier.

one example is shown below. In the example carrier indices are not in the order of carrier frequency. In the example, Allocation Break Pt Carrier is CC1. It means that sub-block 1 ends at carrier CC1 and sub-block 2 starts at carrier CC4. Sub-block gap is located between carrier CC1 and CC4.



Remote Command	`[:SENSe]:CCARrier:CONFig:ALLocation:NCONtiguous:ABPoint CC0 | … | CC4` `[:SENSe]:CCARrier:CONFig:ALLocation:NCONtiguous:ABPoint?`
Example	`:CCAR:CONF:ALL:NCON:ABP CC0` `:CCAR:CONF:ALL:NCON:ABP?`
Notes	The options CC1~CC4 can be enabled with 9080B/9082B-2FP license
Dependencies	Allocation Break Point is coupled to Number of Component Carriers. For example, Allocation Break Point list will include CC0~CC1 if the number of Component Carriers is 2
Preset	CC0
State Saved	Saved in instrument state
Range	CC0|CC1|CC2|CC3|CC4

Configure Comp Carriers

Lets you perform a detailed configuration of your component carriers, including number of carriers, presets, bandwidth, offset, integration bandwidth, etc.

Configure CCs

Lets you configure System Bandwidth, frequency offsets, and integration bandwidth, and also lets you exclude certain carriers from the measurement.

Number of Component Carriers

See "Number of Component Carriers" on page 2245.

Carrier Allocation

See "Carrier Allocation" on page 2245.

Non-Contiguous Break at

See "Non-Contiguous Break at" on page 2246.

System BW

Enables you to set the system bandwidth of each component carrier for LTE-Advanced / NB-IoT signal (which also determines the total number of resource blocks for Modulation Analysis measurement).

Remote Command	`[:SENSe]:CCARrier0|…|4:RADio:STANdard:BANDwidth B1M4 | B3M | B5M | B10M | B15M | B20M | B200K` `[:SENSe]:CCARrier0|…|4:RADio:STANdard:BANDwidth?`
Example	`:CCAR4:RAD:STAN:BAND B5M`
Preset	B5M
State Saved	Yes
Range	1.4 MHz (6 RB) | 3 MHz (15 RB) | 5 MHz (25 RB) | 10 MHz (50 RB) | 15 MHz (75 RB) | 20 MHz (100 RB) | 200kHz (NB-IoT)
Backwards Compatibility SCPI	`[:SENSe]:RADio:STANdard:BANDwidth`

Measure Carrier

Sets whether to measure this component carrier or not.

Remote Command	`[:SENSe]:CCARrier0|…|4[:STATe] OFF | ON | 0 | 1` `[:SENSe]:CCARrier0|…|4[:STATe]?`
Example	`:CCAR0 ON` `:CCAR0?`
Notes	The command is used with a sub-op code <n> (default=0) to specify the component carrier for configuration. The range of the sub-op code is determined by the number of component carriers
Preset	ON
State Saved	Saved in instrument state
Range	On|Off

Frequency Offset

Sets the component carrier center frequency as offset from the Carrier Ref Frequency.

Remote Command	`[:SENSe]:CCARrier<n>:FREQuency:OFFSet <freq>` `[:SENSe]:CCARrier<n>:FREQuency:OFFSet?`
Example	`:CCAR4:FREQ:OFFS 10MHz` `:CCAR4:FREQ:OFFS?`
Notes	Used with a sub-op code <n> (default=0) to specify the component carrier for configuration. The range of the sub-op code is determined by the number of component carriers
Preset	0Hz
State Saved	Saved in instrument state
Min	-3.5GHz
Max	3.5GHz

Spectrum

Determines if the spectrum of the incoming data is mirrored or not. The actual mirroring is accomplished by conjugating the complex time data.

Note that only the Modulation Analysis measurement and Conformance EVM measurement support this feature.

Remote Command	`[:SENSe]:CCARrier0|…|4:SPECtrum NORMal	INVert` `[:SENSe]:CCARrier0|…|4:SPECtrum?`
Example	`:CCAR0:SPEC INV` `:CCAR0:SPEC?`
Preset	NORM
State Saved	Yes
Range	Normal | Invert
Backwards Compatibility SCPI	`[:SENSe]:SPECtrum`

UL/DL Configuration

Allows you to set the Uplink and Downlink allocation configuration of the signal being measured. The choice of link direction will determine which slot in the frame is used for uplink transmission, and which slot for downlink transmission.

Remote Command	`[:SENSe]:CCARrier0|…|4:RADio:STANdard:ULDL CONF0	…	CONF6` `[:SENSe]:CCARrier0|…|4:RADio:STANdard:ULDL?`
Example	`:CCAR0:RAD:STAN:ULDL CONF0`
Notes	CONF0: Configuration 0 (DSUUUDSUUU) CONF1: Configuration 1 (DSUUDDSUUD)

	CONF2: Configuration 2 (DSUDDDSUDD) CONF3: Configuration 3 (DSUUUDDDDD) CONF4: Configuration 4 (DSUUDDDDDD) CONF5: Configuration 5 (DSUDDDDDDD) CONF6: Configuration 6 (DSUUUDSUUD)
Preset	CONF0
State Saved	Yes
Range	Configuration 0|Configuration 1|Configuration 2|Configuration 3|Configuration 4|Configuration 5|Configuration 6
Backwards Compatibility SCPI	`[:SENSe]:RADio:STANdard:ULDL`

Dw/GP/Up Len

This control allows you to set the DwPTS/GP/UpPTS length configuration of the signal being measured. The choice of link direction will determine the length of DwPTS, GP and UpPTS in the Special Subframe.

Remote Command	`[:SENSe]:CCARrier0|…|4:RADio:STANdard:DGPU CONF0 | … | CONF9` `[:SENSe]:CCARrier0|…|4:RADio:STANdard:DGPU?`
Example	`:CCAR0:RAD:STAN:DGPU CONF0`
Notes	CONF0: Configuration 0 CONF1: Configuration 1 CONF2: Configuration 2 CONF3: Configuration 3 CONF4: Configuration 4 CONF5: Configuration 5 CONF6: Configuration 6 CONF7: Configuration 7 CONF8: Configuration 8 CONF9: Configuration 9
Dependencies	The special sub-frame configuration 9 is only enabled when it is LTE-Advanced TDD
Preset	CONF0
State Saved	Yes
Range	Configuration 0|Configuration 1|Configuration 2|Configuration 3|Configuration 4|Configuration 5|Configuration 6|Configuration 7|Configuration 8|Configuration 9
Backwards Compatibility SCPI	`[:SENSe]:RADio:STANdard:DGPU`

Sidelink Mode

Set the sidelink mode per uplink component carrier. The setting is used to indicate whether the component carrier is cellular LTE or sidelink V2X. There are two modes listed as below:

- None: The component carrier is legacy LTE uplink carrier. The lte uplink parameters per carrier are in scope
- V2X: The component carrier is sidelink V2X carrier. The sidelink parameters per carrier are in scope

Remote Command	`[:SENSe]:CCARrier0|…|4:RADio:SLINk:MODE NONE | V2X` `[:SENSe]:CCARrier0|…|4:RADio:SLINk:MODE?`
Example	`:CCAR4:RAD:SLIN:MODE V2X`
Notes	The setting is available when Direction is Uplink with the required license
State Saved	Yes
Range	None | V2X

CHP Power Integ BW

Specifies the range of integration used in calculating the power in the component carrier s in the CHP measurement.

Remote Command	`[:SENSe]:CCARrier0|…|4:CHPower:BANDwidth:INTegration <freq>` `[:SENSe]:CCARrier0|…|4:CHPower:BANDwidth:INTegration?`
Example	`:CCAR0:CHP:BAND:INT 20MHz` `:CCAR0:CHP:BAND:INT?`
Notes	You must be in LTEATDD/LTEAFDD Mode to use this command. Use :INSTrument:SELect to set the mode
Couplings	When System Bandwidth of the parameter set is changed, the value of this parameter also changes as shown in the following table.

System Bandwidth	CHP Integ BW
1.4 MHz (B1M4)	1.4 MHz
3 MHz (B3M)	3 MHz
5 MHz (B5M)	5 MHz
10 MHz (B10M)	10 MHz
15 MHz (B15M)	15 MHz
20 MHz (B20M)	20 MHz
200 kHz(B200K)	200 kHz

Preset	5 MHz
State Saved	Saved in instrument state
Min	100 kHz
Max	20 MHz
Backwards Compatibility SCPI	`[:SENSe]:CHPower:BANDwidth:INTegration` `[:SENSe]:CHPower:BWIDth:INTegration`

ACP Power Integ BW

Specifies the Measurement Noise Bandwidth used to calculate the power in the component carriers in the ACP measurement.

Remote Command	`[:SENSe]:CCARrier0|…|4:ACPower:BANDwidth[1]|2:INTegration <freq>` `[:SENSe]:CCARrier0|…|4:ACPower:BANDwidth[1]|2:INTegration?`
Example	`:CCAR0:ACP:BAND:INT 20MHz` `:CCAR0:ACP:BAND:INT?`
Notes	Carrier sub op code, 1 is for BTS, 2 for MS. Default is BTS You must be in the LTEATDD/LTEAFDD mode. Use :INSTrument:SELect to set the mode
Couplings	When System Bandwidth of the parameter set is changed, the value of this parameter also changes as shown in the following table.

System Bandwidth	BTS ACP Meas Noise BW	MS ACP Meas Noise BW
1.4 MHz (B1M4)	1.095 MHz	1.08 MHz
3 MHz (B3M)	2.715 MHz	2.7 MHz
5 MHz (B5M)	4.515 MHz	4.5 MHz
10 MHz (B10M)	9.015 MHz	9.0 MHz
15 MHz (B15M)	13.515 MHz	13.5 MHz
20 MHz (B20M)	18.015 MHz	18.0 MHz
200 kHz(B200K)	180 kHz	180 kHz

Preset	4.515 MHz|4.5 MHz
State Saved	Yes
Min	100 kHz
Max	20 MHz
Backwards Compatibility SCPI	`[:SENSe]:ACPower:CARRier[1]|2:LIST:BANDwidth[:INTegration]` `[:SENSe]:ACPower:CARRier[1]|2:LIST:BWIDth[:INTegration]`

SEM Power Integ BW

Specifies the integration bandwidth used to calculate the power in the component carriers in SEM measurement.

Remote Command	`[:SENSe]:CCARrier0|…|4:SEMask:BANDwidth[1]|2:INTegration <freq>` `[:SENSe]:CCARrier0|…|4:SEMask:BANDwidth[1]|2:INTegration?`
Example	`:CCAR0:SEM:BAND:INT 20MHz` `:CCAR0:SEM:BAND:INT?`
Notes	Bandwidth sub op code, 1 is for BTS, 2 for MS. Default is BTS You must be in LTEATDD/LTEAFDD Mode to use this command. Use :INSTrument:SELect to set the mode
Couplings	When System Bandwidth of the parameter set is changed, the value of this parameter also changes as shown in the following table. Note that you cannot set the value exceeding the corresponding System Bandwidth

System Bandwidth	BTS SEM Integ BW	MS SEM Integ BW
1.4 MHz (B1M4)	1.095 MHz	1.08 MHz
3 MHz (B3M)	2.715 MHz	2.7 MHz
5 MHz (B5M)	4.515 MHz	4.5 MHz
10 MHz (B10M)	9.015 MHz	9.0 MHz
15 MHz (B15M)	13.515 MHz	13.5 MHz
20 MHz (B20M)	18.015 MHz	18.0 MHz
200 kHz(B200K)	180 kHz	180 kHz

Preset	4.515 MHz|4.5 MHz
State Saved	Saved in instrument state
Min	100 kHz
Max	20 MHz
Backwards Compatibility SCPI	`[:SENSe]:SEMask:BANDwidth[1]|2:INTegration`

Carrier Config Presets

Lets you configure the Component Carrier presets.

Max BTS RF Bandwidth

Sets max BS RF bandwidth used when the carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:RFBW <freq>` `[:SENSe]:CCARrier:CONFig:RFBW?`
Example	`:CCAR:CONF:RFBW 40MHz` `:CCAR:CONF:RFBW?`
Preset	40MHz
State Saved	Saved in instrument state
Min	1.4MHz
Max	200 MHz

Carrier Spacing Delta

Sets delta channel spacing used when the carrier configuration preset runs. Channel spacing is determined from this value and the default channel spacing defined in the standard, i.e. Channel spacing = (BW_{chan1} + BW_{chan2}) * 0.5 + [the delta spacing]. Since this value is a difference from the default spacing, this value can be negative to allow narrower channel spacing. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:SPACing:DELTa <freq>` `[:SENSe]:CCARrier:CONFig:SPACing:DELTa?`
Example	`:CCAR:CONF:SPAC:DELT -200kHz` `:CCAR:CONF:SPAC:DELT?`
Preset	0Hz
State Saved	Saved in instrument state
Min	-1.0 MHz
Max	10.0 MHz

Preset ETC

The ETC configuration is applied. The component carrier parameters are dynamically changed using values of the parameters of each test configuration under Carrier Config Presets menu when some test configuration is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig NONE | ETC1 | ETC2 | ETC3` `[:SENSe]:CCARrier:CONFig?`

Example	`:CCAR:CONF ETC1` `:CCAR:CONF?`
Notes	The control for NONE is not available
State Saved	Saved in instrument state
Range	ETC1|ETC2|ETC3

ETC1 Attributes

Sets ETC1 carrier configuration.

Max Number of Component Carriers

Sets max component carriers placed when the ETC1 carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC1:CMAX <integer>` `[:SENSe]:CCARrier:CONFig:ETC1:CMAX?`
Example	`:CCAR:CONF:ETC1:CMAX 5` `:CCAR:CONF:ETC1:CMAX?`
Preset	5
State Saved	Saved in instrument state
Max	5
Min/Max	1

Component Carrier System BW

Sets bandwidth of the component carriers placed when the ETC1carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC1:BANDwidth B1M4 | B3M | B5M | B10M | B15M | B20M | B200K` `[:SENSe]:CCARrier:CONFig:ETC1:BANDwidth?`
Example	`:CCAR:CONF:ETC1:BAND B5M` `:CCAR:CONF:ETC1:BAND?`
Preset	B5M
State Saved	Saved in instrument state
Range	1.4MHz|3MHz|5MHz|10MHz|15MHz|20MHz|200kHz

Component Carrier Narrowest BW

Sets narrowest bandwidth of the component carriers placed when the ETC1 carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC1:BANDwidth:NARRowest B1M4 | B3M | B5M | B10M | B15M | B20M | B200K` `[:SENSe]:CCARrier:CONFig:ETC1:BANDwidth:NARRowest?`
Example	`:CCAR:CONF:ETC1:BAND:NARR B1M4` `:CCAR:CONF:ETC1:BAND:NARR?`
Preset	B1M4
State Saved	Saved in instrument state
Range	1.4MHz|3MHz|5MHz|10MHz|15MHz|20MHz|200kHz

ETC2 Attributes

Sets ETC2 carrier configuration.

Max Number of Component Carriers

Sets max component carriers placed when the ETC2 carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC2:CMAX <integer>` `[:SENSe]:CCARrier:CONFig:ETC2:CMAX?`
Example	`:CCAR:CONF:ETC2:CMAX 5` `:CCAR:CONF:ETC2:CMAX?`
Preset	5
State Saved	Saved in instrument state
Min	1
Max	5

Carrier Side (with BTS RF BW)

Select the side of RF bandwidth to place the ETC2 component carriers. When this value is changed, the carrier configuration preset is initiated.

- NEGative - Negative (lower) edge of RF bandwidth. If the option is selected, the available component carriers will be placed sequentially from the lower edge of the RF bandwidth starting from first
- POSitive - Positive (upper) edge of RF bandwidth, If the option is selected, the available component carriers will be placed sequentially from the upper edge of the RF bandwidth starting from first

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC2:BANDwidth:SIDE NEGative | POSitive` `[:SENSe]:CCARrier:CONFig:ETC2:BANDwidth:SIDE?`
Example	`:CCAR:CONF:ETC2:BAND:SIDE NEG` `:CCAR:CONF:ETC2:BAND:SIDE?`
Preset	NEGative
State Saved	Saved in instrument state
Range	NEGative|POSitive

Component Carrier System BW

Sets carrier bandwidth of the component carriers placed when the ETC2 carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC2:BANDwidth:CARRier[1]|2|…|5 B1M4 | B3M | B5M | B10M | B15M | B20M | B200K` `[:SENSe]:CCARrier:CONFig:ETC2:BANDwidth:CARRier?`
Example	`:CCAR:CONF:ETC2:BAND:CARR B5M` `:CCAR:CONF:ETC2:BAND:CARR?`
Dependencies	The Carrier Bandwidth is coupled to Max Component Carriers. The settings are enabled following the Max Component Carriers. For example, the 1st Carrier Bandwidth and 2nd Carrier Bandwidth will be available if the Max Component Carriers is 2
Preset	B5M
State Saved	Saved in instrument state
Range	1.4MHz|3MHz|5MHz|10MHz|15MHz|20MHz|200kHz

ETC3 CC Bandwidth

Sets the bandwidth of the component carriers placed when the ETC3 carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC3:BANDwidth B1M4 | B3M | B5M | B10M | B15M | B20M | B200K`

	`[:SENSe]:CCARrier:CONFig:ETC3:BANDwidth?`
Example	`:CCAR:CONF:ETC3:BAND B5M` `:CCAR:CONF:ETC3:BAND?`
Preset	B5M
State Saved	Saved in instrument state
Range	1.4MHz|3MHz|5MHz|10MHz|15MHz|20MHz|200kHz

Offset

Lets you configure the spacing of the offset regions.

Offset Frequency Define

Lets you select offset frequency definition. Each standard defines each offset frequency from Carrier.

For example, 3GPP2 requires the “From Carrier Center to Integ BW Closer Edge” definition. LTE conformance test requires “From Carrier Edge to Integ BW Center” and/or “From Carrier Edge to Integ BW Closer Edge” definition.

`CTOCenter`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the center frequency of each Offset Integ BW
`CTOEdge`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the closest edge frequency of each Offset Integ BW
`ETOCenter`	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the center frequency of each Offset Integ BW
`ETOEdge`	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the closest edge of each Offset Integ BW
`RTOCenter` 5G NR Mode only	From either the lower or upper RF BW** edge frequency to the center frequency of each Offset Integ BW
`RTOEdge` 5G NR Mode only	From either the lower or upper RF BW** edge frequency to the closest edge frequency of each Offset Integ BW
`RCTOCenter` 5G NR Mode only	From the center frequency of RF BW** to the center frequency of each Offset Integ BW
`SCTOCenter` 5G NR Mode only	From the center frequency of sub-block** to the center frequency of each Offset Integ BW

** RF BW = BWchannel,CA which is defined in each 3GPP standard, regardless of “Measure Carrier” for the uppermost and the lowermost carriers being Enabled or

Disabled. When the Number of Component Carrier = 1, RF BW = $BW_{channel}$ = 2 x $F_{offset,RAT}$

** sub-block (bandwidth) = $BW_{channel,block}$ which is defined in each 3GPP standard, regardless of “Measure Carrier” for the uppermost and the lowermost carriers being Enabled or Disabled. When the Number of Component Carrier within each sub-block = 1, sub-block (bandwidth) = $BW_{channel}$ = 2 x $F_{offset,RAT}$.

See "Diagrams for Offset Freq Define" on page 603.

Modes other than MSR, LTEAFDD, LTEATDD, 5G NR

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE CTOCenter | CTOEdge | ETOCenter | ETOEdge`
	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS:TYPE ETOC` `:ACP:OFFS:TYPE?`
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	`CTOCenter`
State Saved	Saved in instrument state
Range	`CTOCenter|CTOEdge|ETOCenter|ETOEdge`

Mode: MSR, LTEAFDD, LTEATDD

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE CTOCenter | CTOEdge | ETOCenter | ETOEdge`
	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS:TYPE ETOC` `:ACP:OFFS:TYPE?`
Preset	`CTOCenter`
State Saved	Saved in instrument state
Range	`CTOCenter|CTOEdge|ETOCenter|ETOEdge`

Mode: 5G NR

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE CTOCenter | CTOEdge | ETOCenter | ETOEdge | RTOCenter | RTOEdge | RCTOCenter | SCTOCenter`

	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE?` Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink
Example	`:ACP:OFFS:TYPE ETOC` `:ACP:OFFS:TYPE?`
Preset	`CTOCenter`
State Saved	Saved in instrument state
Range	`CTOCenter | CTOEdge | ETOCenter | ETOEdge | RTOCenter | RTOEdge | RCTOCenter | SCTOCenter`

Diagrams for Offset Freq Define

Details depend on the selected mode.

Diagram for Modes other than MSR, LTEAFDD, LTEATDD, 5G NR

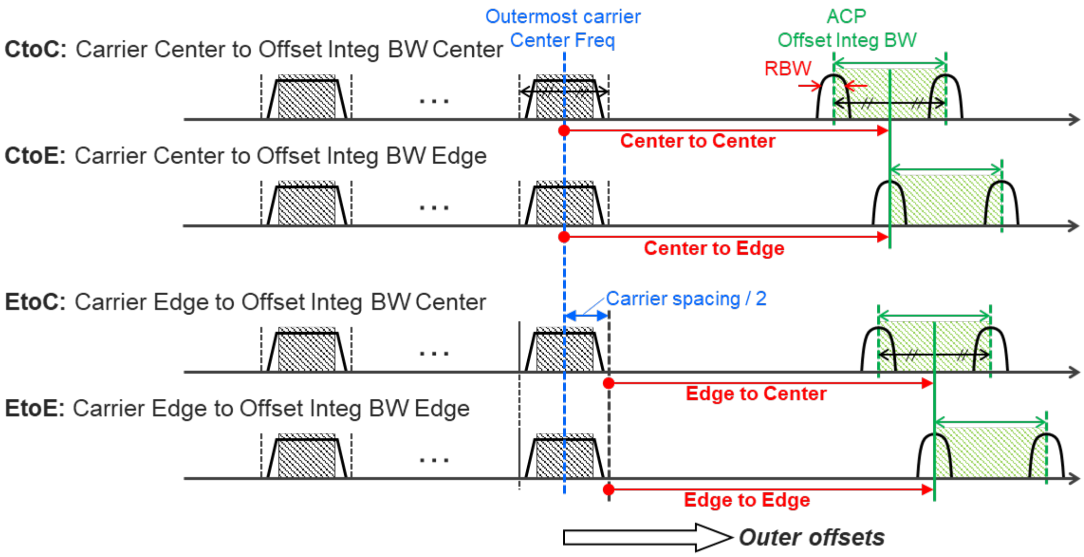


Diagram for MSR, LTEAFDD, LTEATDD, 5G NR

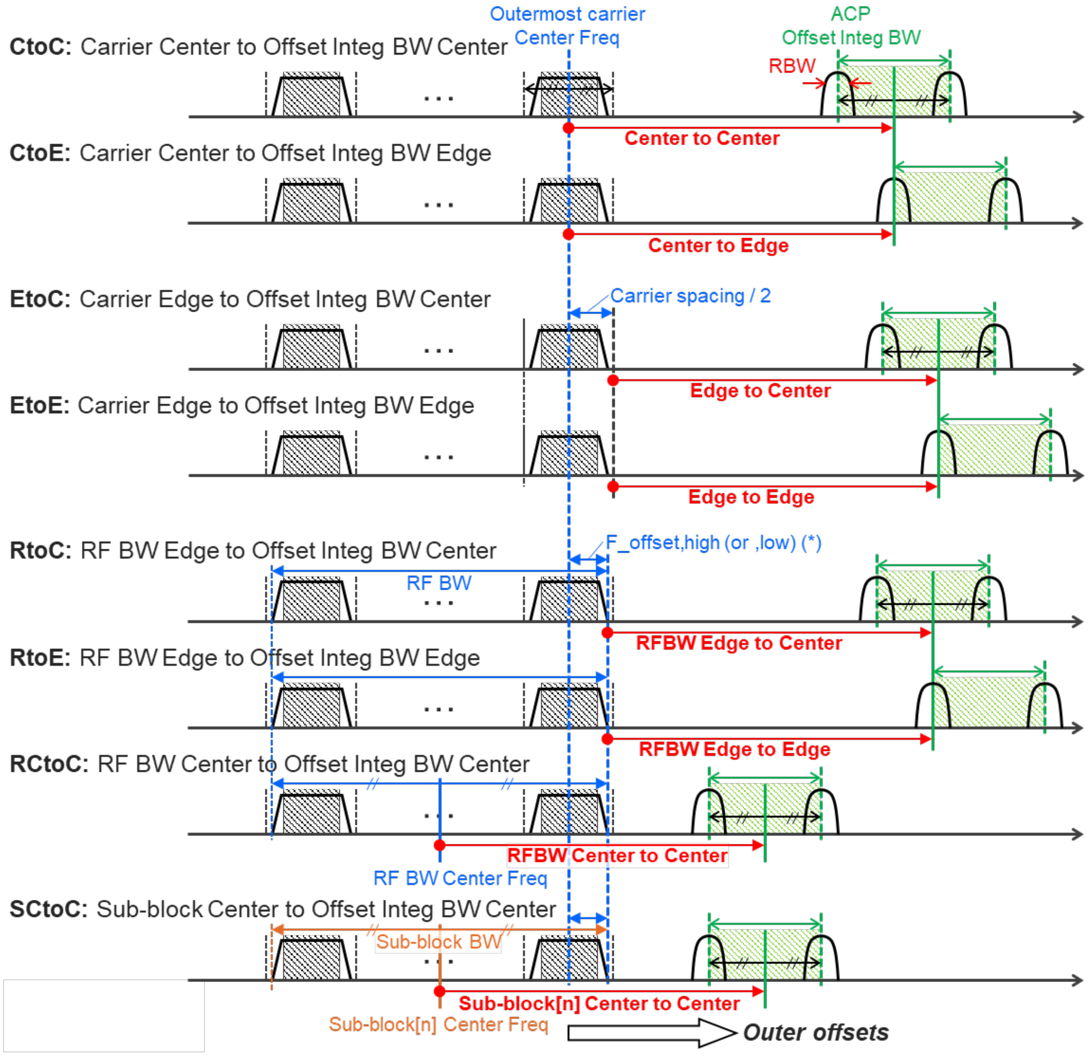

Note:

RF BW Edge and Outermost Carrier Edge are not always the same.
e.g.) 5G NR (3GPP) defines BW_channel, CA which calculates F_offset,high and F_offset,low asymmetrically with SCS shift.
(*) For MSR, F_offset,high (or ,low) = F_offset,RAT,high (or ,low)

Offset Freq

Determines the frequency difference between the center of the main channel and the center of the carrier.

Each **Offset Freq** state value is entered individually by selecting the desired carrier.

The list contains up to six (6) entries, depending on the mode selected, for offset frequencies. Each offset frequency in the list corresponds to a reference bandwidth in the bandwidth list.

An offset frequency of zero turns the display of the measurement for that offset off, but the measurement is still made and reported. You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet:LIST:STATe`.

Turning the offset off has the same effect as setting the frequency of the offset to 0 Hz, and causes it to be removed from the results screen.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST[:FREQuency] <freq>,…`
	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST[:FREQuency]?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS1:LIST 0,0,0,0,0,0` `:ACP:OFFS1:LIST?`
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the offset. Missing values are not permitted, unless the number of values sent is greater than the number of carriers, in which case subsequent values are ignored
Couplings	Changing Offset Frequency might affect "Span" on page 569
Preset	When "Max Num of Offsets" on page 633 is set to 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
SA	3 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz, 0 Hz | 3 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz, 0 Hz
WCDMA	5.0 MHz, 10.0 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz | 5.0 MHz, 10.0 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz
LTEAFDD, LTEATDD, MSR	5.0 MHz, 10.0 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz | 5.0 MHz, 10.0 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz
5G NR	100 MHz, 200 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz | 100 MHz, 200 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz
Radio Test	25 kHz, 50 kHz, 75 kHz, 0 Hz, 0 Hz, 0 Hz

State Saved	Saved in instrument state
Min/Max	0 Hz/Depends on instrument maximum frequency. Same as Max Span of the Swept SA Measurement
Backwards Compatibility SCPI	`[:SENSe]:MCPower:OFFSet[1]|2:LIST[:FREQuency]`

Auto Function

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:STATe OFF | ON | 0 | 1,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:STATe?`

<table>
<tr><td></td><td>Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink</td></tr>

Min/Max	10 Hz/Depends on instrument maximum frequency. Same as Max Span of the Swept SA Measurement

Backwards Compatibility SCPI	`[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth[:INTegration]`
	`[:SENSe]:ACPR:OFFSet[1]|2:LIST:BANDwidth`
	`[:SENSe]:ACPR:OFFSet[1]|2:LIST:BWIDth`
	`[:SENSe]:MCPower:OFFSet[1]|2:LIST:BANDwidth[:INTegration]`
	`[:SENSe]:MCPower:OFFSet[1]|2:LIST:BWIDth[:INTegration]`

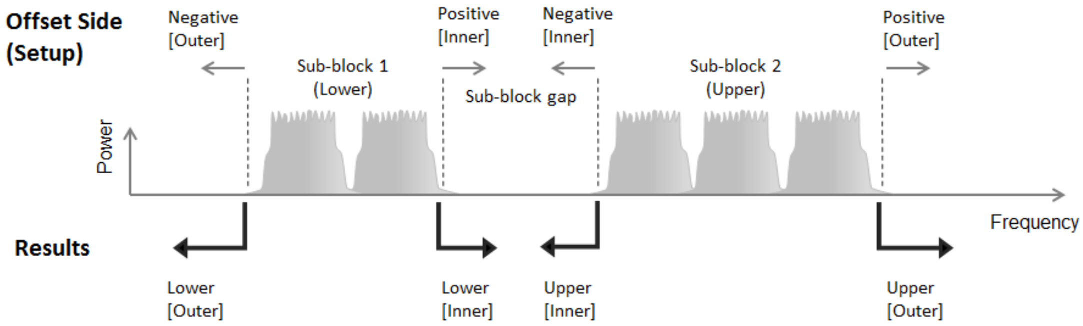
Offset Side

Specifies which offset side to measure.

You can turn off (not use) specific offsets with `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:SIDE`.

`NEGative`	Negative (lower) sideband only
`BOTH`	Both of the negative (lower) and positive (upper) sidebands
`POSitive`	Positive (upper) sideband only

The figure below shows the relation between the negative/positive offset side setups and the upper/lower results in MSR, LTEAFDD and LTEATDD Modes.



Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:SIDE NEGative | BOTH | POSitive, …`
	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:SIDE?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS:LIST:SIDE BOTH` `:ACP:OFFS:LIST:SIDE?`
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored If you set POS or NEG in an offset, result of the inactive side returns -999
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is BOTH `BOTH, BOTH, BOTH, BOTH, BOTH, BOTH | BOTH, BOTH, BOTH, BOTH, BOTH, BOTH`
State Saved	Saved in instrument state
Range	`NEGative|BOTH|POSitive`

Method

Allows you to turn RRC filtering of each offset on or off. The value (roll off) for the filter will be set to the value of the **Filter Alpha** parameter.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:FILTer[:RRC][:STATe] ON | OFF | 1 | 0,…`
	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:FILTer[:RRC][:STATe]?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS:LIST:FILT 1,0,0` `:ACP:OFFS:LIST:FILT?`
Notes	1|ON = RRC Weighted, 0|OFF = Integ BW Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is the same as the Offset F value

	Mode	**Values**
	SA	0, 0, 0, 0, 0, 0 | 0, 0, 0, 0, 0,0
	WCDMA	1, 1, 1, 1, 1, 1 | 1, 1, 1, 1, 1, 1
	LTEAFDD, LTEATDD, 5G NR, MSR	0, 0, 0, 0, 0, 0 | 0, 0, 0, 0, 0,0
	Radio Test	0, 0, 0, 0, 0, 0
State Saved	Saved in instrument state	
Range	Integ BW | RRC Weighted	

Filter Alpha

Sets the alpha value for the RRC Filter for each offset.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:FILTer:ALPHa <real>,…`
	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:FILTer:ALPHa?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink	

Example	`:ACP:OFFS:LIST:FILT:ALPH 0.5,0.5,0.5,0.5,0.5,0.5` `:ACP:OFFS:LIST:FILT:ALPH?`	
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored	
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is the same as the Offset F value	
	SA	0.22,0.22,0.22,0.22,0.22,0.22|0.22,0.22,0.22,0.22,0.22,0.22
	WCDMA	0.22,0.22,0.22,0.22,0.22,0.22|0.22,0.22,0.22,0.22,0.22,0.22
	LTEAFDD, LTEATDD, 5G NR, MSR	0.22,0.22,0.22,0.22,0.22,0.22|0.22,0.22,0.22,0.22,0.22,0.22
State Saved	Saved in instrument state	
Min/Max	0.01/1.00	

Advanced (Offset)

Opens a further menu page, which lets you set advanced properties of the Inner Offset, such as Res BW, Video BW, and Filter parameters.

Offset Freq

This column is the same as "Offset Freq" on page 645 in the main **Offset** menu.

Res BW

Sets the resolution bandwidth. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

<table>
<tr><td>Remote Command</td><td><code>[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:RESolution <freq>,…</code>
<code>[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:RESolution?</code>
Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink</td></tr>
<tr><td>Example</td><td><code>:ACP:OFFS2:LIST:BAND:RES 220kHz,220kHz,220kHz,220kHz,220kHz,220kHz</code>
<code>:ACP:OFFS2:LIST:BAND:RES?</code></td></tr>
<tr><td>Notes</td><td>Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored</td></tr>
<tr><td>Dependencies</td><td>When "Meas Method" on page 582 is RBW, FAST or Fast Power, this cell is grayed-out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent SCPI remote command is sent, a "Setting conflict" warning is generated</td></tr>
<tr><td>Couplings</td><td>When Res BW Mode is Auto, this value is exactly same as Res BW. When you change this value, Res BW Mode also changes to Man</td></tr>
<tr><td>Preset</td><td>When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is the same as the Offset F value

</table></td></tr>
<tr><td>State Saved</td><td>Saved in instrument state</td></tr>
<tr><td>Min/Max</td><td>1 Hz/50 MHz</td></tr>
<tr><td>Backwards Compatibility SCPI</td><td><code>[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:VIDeo</code></td></tr>
</table>

Auto Function

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:VIDeo:AUTO OFF | ON | 0 | 1,…`
	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:VIDeo:AUTO?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS2:LIST:BAND:VID:AUTO 0,0,0,0,1,1` `:ACP:OFFS2:LIST:BAND:VID:AUTO?`
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is `ON` `ON, ON, ON, ON, ON, ON`

State Saved	Yes
Backwards Compatibility SCPI	`[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:VIDeo:AUTO`

Filter Type

Selects the type of bandwidth filter that is used.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:SHAPe GAUSsian | FLATtop,…`
	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:SHAPe?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS2:LIST:BAND:SHAP FLAT,GAUS,GAUS,GAUS,GAUS,GAUS` `:ACP:OFFS2:LIST:BAND:SHAP?`
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Dependencies	When "Res BW" on page 553 Mode for the offset is **Auto**, this cell is grayed out and disabled. Since **Res BW** Mode for the offset is preset to **Auto** on changing "Meas Method" on page 582 to RBW, FAST or Fast Power, this cell is grayed-out and disabled too. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is `GAUSsian GAUSsian, GAUSsian, GAUSsian, GAUSsian, GAUSsian, GAUSsian`
State Saved	Saved in instrument state
Range	`GAUSsian|FLATtop`
Backwards Compatibility SCPI	`[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:SHAPe`

Filter BW

Selects a Gaussian filter based on its –3 dB (Normal) bandwidth or its –6 dB bandwidth.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:TYPE DB3 | DB6,…`
	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:TYPE?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS2:LIST:BAND:TYPE DB3,DB3,DB3,DB3,DB3,DB3` `:ACP:OFFS2:LIST:BAND:TYPE?`
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored

Dependencies	When "RBW Filter Type" on page 556 is Flattop, or "Res BW" on page 553 Mode for the offset is **Auto**, this cell is grayed-out and disabled. Since **Res BW** Mode for the offset is preset to **Auto** on changing "Meas Method" on page 582 to RBW, FAST or Fast Power, this cell is grayed-out and disabled too. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is `DB3` `DB3, DB3, DB3, DB3, DB3, DB3`
State Saved	Saved in instrument state
Range	–3 dB (Normal)| –6 dB
Backwards Compatibility SCPI	`[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:TYPE`

Limits

Lets you configure the limits that are used to determine whether the offset regions `PASS` or `FAIL` the limit test.

Limit Test

This checkbox is the same as "Limit Test" on page 613 in the **Meas Setup, Settings** tab.

Offset Freq

This column is the same as "Offset Freq" on page 645 in the **Offset** index tab.

Abs Limit

Specifies an absolute limit value, which sets the absolute amplitude levels to test against for each of the custom offsets. The list must contain 6 entries. If there is more than one offset, the offset closest to the carrier channel is the first one in the list. `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with the `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe` command.

The query returns the six (6) sets of real numbers that are the current absolute amplitude test limits.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:ABSolute < real>,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:ABSolute?`

<table>
<tr><td></td><td>Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink</td></tr>
<tr><td>Example</td><td><code>:ACP:OFFS2:LIST:ABS -10,-10,-10,-10,-10,-10</code>
<code>:ACP:OFFS2:LIST:ABS?</code></td></tr>
<tr><td>Notes</td><td>Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored</td></tr>
<tr><td>Preset</td><td>When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is the same as the Offset F value
<table>
<tr><th>Modes</th><th>Values</th></tr>
<tr><td>SA</td><td>0dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm | 0dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm</td></tr>
<tr><td>WCDMA</td><td>50 dBm, 50 dBm, 50 dBm, 50 dBm, 50 dBm, 50 dBm | 50 dBm, 50 dBm, 50 dBm, 50 dBm, 50 dBm, 50 dBm</td></tr>
<tr><td>LTEAFDD, LTEATDD, MSR</td><td>-8.45, -8.45, -8.45, -8.45, -8.45, -8.45 | -50.0, -50.0, -50.0, -50.0, -50.0, -50.0</td></tr>
<tr><td>5G NR</td><td>4.92, 4.92, 4.92, 4.92, 4.92, 4.92 | -50.0, -50.0, -50.0, -50.0, -50.0, -50.0</td></tr>
</table></td></tr>
<tr><td>State Saved</td><td>Saved in instrument state</td></tr>
<tr><td>Min/Max</td><td>-200.0 dBm/50.0 dBm</td></tr>
<tr><td>Backwards Compatibility SCPI</td><td><code>[:SENSe]:ACPR:OFFSet[1]|2:LIST:ABSolute</code>
SA, W-CDMA
<code>[:SENSe]:MCPower:OFFSet[1]|2:LIST:ABSolute</code>
SA, W-CDMA</td></tr>
</table>

Rel Limit (Car)

Enters a relative limit value for the carrier level. This sets the amplitude levels to test against for the specified offsets.

The amplitude level is relative to the carrier amplitude. If multiple offsets are available, the list contains 6 entries. The offset closest to the carrier channel is the first one in the list.

`[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe`.

The query returns the 6 sets of real numbers that are the current amplitude test limits, relative to the carrier, for each offset.

Offset[n] n = 1 is base station and n = 2 is mobiles. The default is base station (1).

Remote	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:RCARrier <real>,…`

Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:RCARrier?` Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink
Example	`:ACP:OFFS2:LIST:RCAR 0,0,0,0,0,0` `:ACP:OFFS2:LIST:RCAR?`
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
SA	-45, -60, 0, 0, 0, 0 | -45, -60, 0, 0, 0, 0
WCDMA	-44.2, -49.2, -49.2, -49.2, -49.2, -49.2 | -32.2, -42.2, -42.2, -42.2, -42.2, -42.2

5G NR	-43.8, -43.8, -43.8, -43.8, -43.8, -43.8 | -29.2, -29.2, -29.2, -29.2, -29.2, -29.2
Radio Test	-60, -60, -60, 0, 0, 0

State Saved	Saved in instrument state
Min/Max	-150/50.0
Backwards Compatibility SCPI	`[:SENSe]:MCPower:OFFSet[1]|2:LIST:RCARrier`

Positive Offset Limit (Remote Command only)

Enables you to set the upper limit for the upper segment of the specified offset pair.

Remote Command	`:CALCulate:ACPower:OFFSet[1]|2[:OUTer]:LIST:LIMit:POSitive[:UPPer]:DATA <real>,...`
	`:CALCulate:ACPower:OFFSet[1]|2[:OUTer]:LIST:LIMit:POSitive[:UPPer]:DATA?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:CALC:ACP:OFFS:LIST:LIM:POS:DATA 0,0,0,0,0,0` `:CALC:ACP:OFFS:LIST:LIM:POS:DATA?`
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
SA	-45, -60, 0, 0, 0, 0 | -45, -60, 0, 0, 0, 0
WCDMA	-44.2, -49.2, -49.2, -49.2, -49.2, -49.2 | -32.2, -42.2, -42.2, -42.2, -42.2, -42.2
LTEAFDD, LTEATDD, MSR	-44.2,-44.2,-44.2,-44.2,-44.2,-44.2 | -29.2, -29.2, -29.2, -29.2, -29.2, -29.2
5G NR	-43.8, -43.8, -43.8, -43.8, -43.8, -43.8 | -29.2, -29.2, -29.2, -29.2, -29.2, -29.2
Radio Test	-60, -60, -60, 0, 0, 0

State Saved	Saved in instrument state
Min/Max	-150.0/50.0
Backwards Compatibility SCPI	`:CALCulate:MCPower:OFFSet:LIST:LIMit:POSitive[:UPPer]:DATA` (Power Suite)

Negative Offset Limit(Remote Command only)

Enables you to set the upper limit for the lower segment of the specified offset pair.

Remote Command	`:CALCulate:ACPower:OFFSet[1]|2[:OUTer]:LIST:LIMit:NEGative[:UPPer]:DATA <real>,...`
	`:CALCulate:ACPower:OFFSet[1]|2[:OUTer]:LIST:LIMit:NEGative[:UPPer]:DATA?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:CALC:ACP:OFFS:LIST:LIM:NEG:DATA 0,0,0,0,0,0` `:CALC:ACP:OFFS:LIST:LIM:NEG:DATA?`
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
SA	-45, -60, 0, 0, 0, 0 | -45, -60, 0, 0, 0, 0
WCDMA	-44.2, -49.2, -49.2, -49.2, -49.2, -49.2 | -32.2, -42.2, -42.2, -42.2, -42.2, -42.2

5G NR	-43.8, -43.8, -43.8, -43.8, -43.8, -43.8 | -29.2, -29.2, -29.2, -29.2, -29.2, -29.2
Radio Test	-60, -60, -60, 0, 0, 0

State Saved	Saved in instrument state
Min/Max	-150.0/50.0
Backwards Compatibility SCPI	`:CALCulate:MCPower:OFFSet:LIST:LIMit:NEGative[:UPPer]:DATA` (Power Suite, WCDMA)

Rel Limit (PSD)

Enters a relative limit value for the level of the power spectral density. This sets the amplitude levels to test against for any custom offsets. The amplitude level is relative to the power spectral density. If multiple offsets are available, the list contains 6 entries. The offset closest to the carrier channel is the first one in the list.

`[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe`.

The query returns the 6 sets of real numbers that are the current amplitude test limits, relative to the power spectral density, for each offset.

Offset[n] n = 1 is base station and n = 2 is mobiles. The default is base station (1).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:RPSDensity <rel_ampl>,…`
	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:RPSDensity?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS2:LIST:RPSD 10,10,10,10,10,10` `:ACP:OFFS2:LIST:RPSD?`
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
SA	-28.87 dB, -43.87 dB, 0 dB, 0 dB, 0 dB, 0 dB | -28.87 dB, -43.87 dB, 0 dB, 0 dB, 0 dB, 0 dB
WCDMA	-44.2 dB, -49.2 dB, -49.2 dB, -49.2 dB, -49.2 dB, -49.2 dB | -32.2 dB, -42.2 dB, -42.2 dB, -42.2 dB, -42.2 dB, -42.2 dB
LTEAFDD, LTEATDD, 5G NR, MSR	0, 0, 0, 0, 0, 0 | 0, 0, 0, 0, 0, 0
Radio Test	-60, -60, -60, 0, 0, 0

State Saved	Saved in instrument state
Min/Max	-150.0 dB/50.0 dB

Fail Mask

Accesses a menu that lets you select one of the logics for the fail conditions between the measurement results and the test limits. The setting defines the type of testing to be done at any custom offset frequencies. The measured powers are tested against the absolute values defined with `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:ABSolute`, or the relative values defined with [:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:RPSDensity and `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:RCARrier`.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe`.

Absolute	`ABSolute`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for **Abs Limit**
Relative	`RELative`	Fail is shown if one of the relative ACP measurement results is larger than the limit for **Rel Lim (Car)** or **Rel Lim (PSD)**
Abs AND Rel	`AND`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for **Abs Limit***and* one of the relative ACP measurement results is larger than the limit for **Rel Lim (Car)** or **Rel Lim (PSD)**
Abs OR Rel	`OR`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for **Abs Limit***or* one of the relative ACP measurement results is larger than the limit for **Rel Lim (Car)** or **Rel Lim (PSD)**

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:TEST ABSolute | AND | OR | RELative,…`
	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:TEST?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS2:LIST:TEST ABS,ABS,ABS,ABS,ABS,ABS` `:ACP:OFFS2:LIST:TEST?`
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
SA, WCDMA	`REL, REL, REL, REL, REL, REL | REL, REL, REL, REL, REL, REL`
LTEAFDD, LTEATDD, 5G NR, MSR	`AND, AND, AND, AND, AND, AND | AND, AND, AND, AND, AND, AND`

	Modes	**Values**
	Radio Test	`REL, REL, REL, REL, REL, REL`
State Saved	Saved in instrument state	
Range	`ABSolute|AND|OR|RELative`	
Backwards Compatibility SCPI	`[:SENSe]:MCPower:OFFSet[1]|2:LIST:TEST`	

Inner Offset

Accesses a menu of functions that contains Offset, Offset Freq/Offset To Edge, Offset Integ BW, Upper Offset Limit and Lower Offset parameters.

Offset Frequency Define

Allows you to select “Offset” definition:

`CTOCenter`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the center frequency of each Offset Integ BW
`CTOEdge`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the closest edge frequency of each Offset Integ BW
`ETOCenter`	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the center frequency of each Offset Integ BW
`ETOEdge`	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the closest edge frequency of each Offset Integ BW
`STOCenter`	From either the lower or upper sub-block edge frequency to the center frequency of each Offset Integ BW
`STOEdge`	From either the lower or upper sub-block edge frequency to the closest edge frequency of each Offset Integ BW
`SCTOCenter` 5G NR Mode only	From the center frequency of sub-block** to the center frequency of each Offset Integ BW

** sub-block (bandwidth) = $BW_{channel,block}$ which is defined in each 3GPP standard, regardless of “Measure Carrier” for the uppermost and the lowermost carriers being Enabled or Disabled. When the Number of Component Carrier within each sub-block = 1, sub-block (bandwidth) = $BW_{channel}$ = 2 x $F_{offset,RAT}$.

See "Diagram for Offset Freq Define" on page 621

Mode: MSR, LTEAFDD, LTEATDD

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:TYPE CTOCenter | CTOEdge | ETOCenter | ETOEdge | STOCenter | STOEdge`
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:TYPE?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

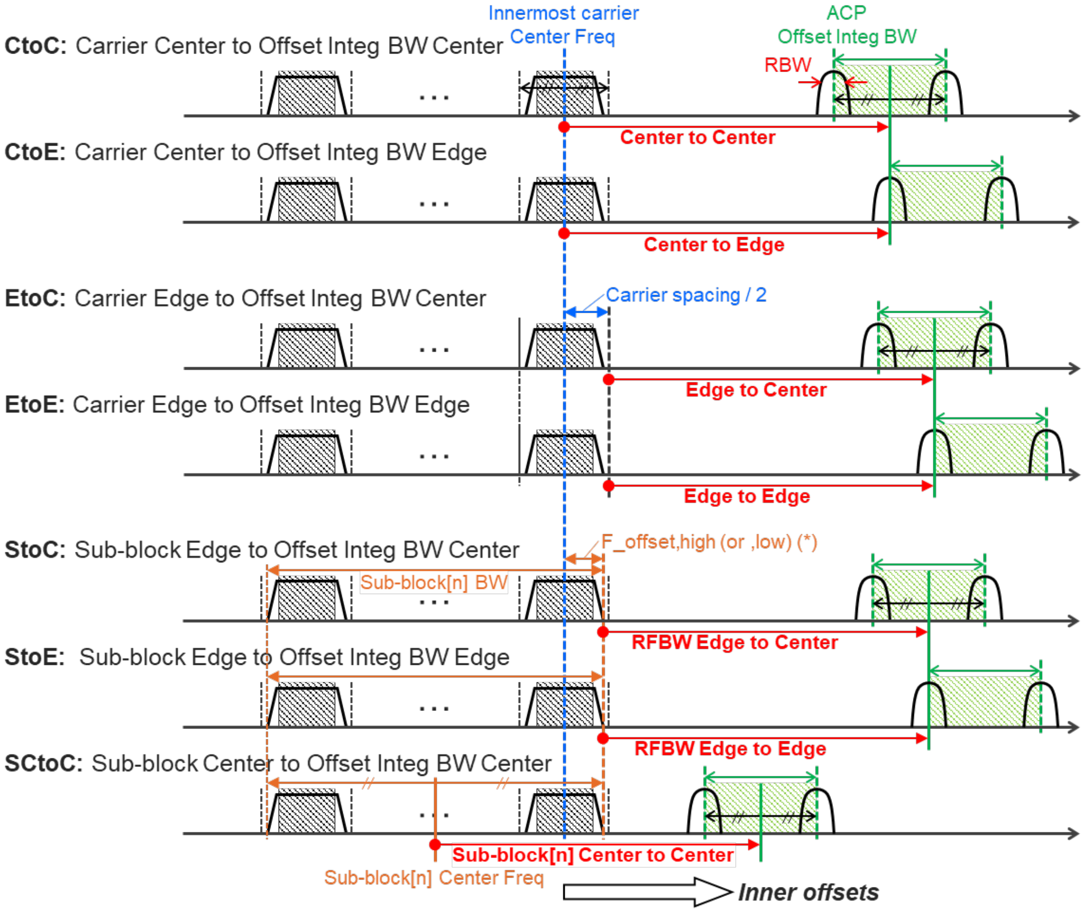
Example	`:ACP:OFFS:INN:TYPE ETOC` `:ACP:OFFS:INN:TYPE?`
Preset	`STOCenter`
State Saved	Saved in instrument state
Range	`CTOCenter|CTOEdge|ETOCenter|ETOEdge|STOCenter|STOEdge`

Mode: 5G NR

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:TYPE CTOCenter | CTOEdge | ETOCenter | ETOEdge | STOCenter | STOEdge | SCTOCenter`
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:TYPE?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS:INN:TYPE ETOC` `:ACP:OFFS:INN:TYPE?`
Preset	`STOCenter | CTOCenter`
State Saved	Saved in instrument state
Range	`CTOCenter | CTOEdge | ETOCenter | ETOEdge | STOCenter | STOEdge | SCTOCenter`

Diagram for Offset Freq Define



Note:

RF BW Edge and Outermost Carrier Edge are not always same.
e.g.) 5G NR (3GPP) defines BW_channel,CA which calculates F_offset,high and F_offset,low asymmetrically with SCS shift

(*) For MSR, F_offset,high (or ,low) = F_offset,RAT,high (or ,low)

Offset Freq

Determines the frequency difference between the center of the main channel and the center of the carrier. When set to Offset to Edge, this parameter determines the frequency difference between the center of the main channel and the near edge of the offset.

Each **Offset Freq** state value is entered individually by selecting the desired carrier. Use the **Enabled** checkbox to turn the **Offset Freq** State on or off.

The list contains up to 6 entries, depending on the mode selected, for offset frequencies. Each offset frequency in the list corresponds to a reference bandwidth in the bandwidth list.

An offset frequency of zero turns the display of the measurement for that offset off, but the measurement is still made and reported. You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe`.

Turning the offset off has the same effect as setting the frequency of the offset to 0 Hz, and causes it to be removed from the results screen.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST[:FREQuency] <freq>,…`
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST[:FREQuency]?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS1:INN:LIST 0,0,0,0,0,0` `:ACP:OFFS1:INN:LIST?`
Notes	When setting these values remotely, the position in the list sent corresponds to the offset. Missing values are not permitted, unless the number of values sent is greater than the number of carriers, then subsequent values are ignored
Couplings	Changing Offset Frequency might affect "Span" on page 569
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
5G NR	10 MHz, 30 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz | 100 MHz, 200 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz
All Others	2.5MHz,7.5MHz,0,0,0,0 | 2.5MHz,7.5MHz,0,0,0,0

State Saved	Saved in instrument state
Min/Max	0 Hz/Depends on instrument maximum frequency. Same as Max Span of the Swept SA Measurement

Auto Function

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:STATe OFF | ON | 0 | 1,…`
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:STATe?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS2:INN:LIST:STAT 1,1,0,0,0,0` `:ACP:OFFS2:INN:LIST:STAT?`
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is the same as the Offset F value `ON, ON, OFF, OFF, OFF, OFF | ON, OFF, OFF, OFF, OFF, OFF`
State Saved	Yes

Integ BW

Sets the Integration Bandwidth for the offsets. Each resolution bandwidth in the list corresponds to an offset frequency in the list defined by `[:SENSe]:ACP:OFFSet[n]:INNer:LIST[:FREQuency]`.

Enter each value individually by selecting the desired offset on the **Offset** menu key using the up down arrows, the knob, or the numeric keypad, then enter the Offset Integration Bandwidth using the **Offset Integration Bandwidth** menu key.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe`.

<table>

<tr><td>5G NR</td><td>19.08 MHz, 19.08 MHz, 19.08 MHz, 19.08 MHz, 19.08 MHz, 19.08 MHz | 98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz</td></tr>
</table></td></tr>
<tr><td>State Saved</td><td>Saved in instrument state</td></tr>
<tr><td>Min/Max</td><td>10 Hz/Depends on instrument maximum frequency. Same as Max Span of the Swept SA Measurement</td></tr>
</table>

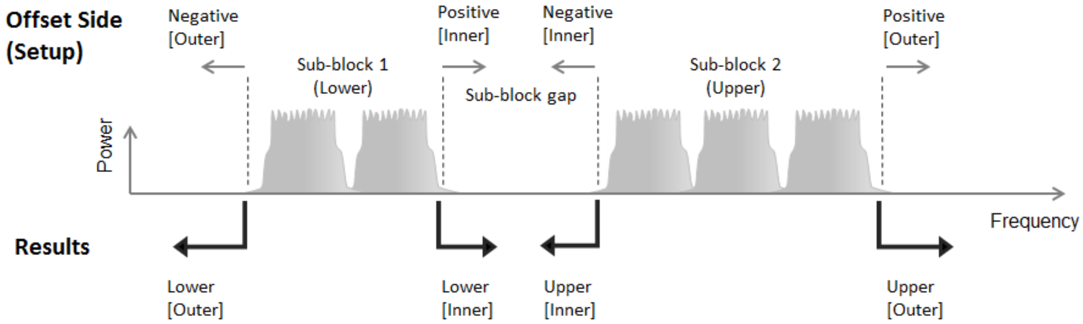
Offset Side

Lets you turn off (not use) specific offsets with `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:SIDE`.

- `NEGative` - The upper side in the sub-block gap only (that is, negative sideband of the upper sub-block) is enabled

- `BOTH` - Both sides in the sub-block gap are enabled
- `POSitive` - The lower side in the sub-block gap only (that is, positive sideband of the lower sub-block) is enabled

The diagram below shows the relation between the negative/positive offset side setups and the upper/lower results in the MSR, LTEAFDD and LTEATDD Modes.



Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:SIDE NEGative | BOTH | POSitive, …`
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:SIDE?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS:INN:LIST:SIDE BOTH` `:ACP:OFFS:INN:LIST:SIDE?`
Notes	If you set `POS` or `NEG` in an offset, result of the inactive side returns -999
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is `BOTH` `BOTH, BOTH, BOTH, BOTH, BOTH, BOTH | BOTH, BOTH, BOTH, BOTH, BOTH, BOTH`
State Saved	Saved in instrument state
Range	`NEGative|BOTH|POSitive`

Method

Lets you turn RRC filtering of each offset on or off. The value (roll off) for the filter is set to the value of the Filter Alpha parameter.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:FILTer[:RRC][:STATe] ON | OFF | 1 | 0,…`
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:FILTer[:RRC][:STATe]?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS:INN:LIST:FILT 1,0,0` `:ACP:OFFS:INN:LIST:FILT?`
Notes	`1|ON` = RRC Weighted, `0|OFF` = Integ BW

Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is the same as the Offset F value **Modes** / **Values** LTEAFDD: 1,1,1,1,1,1 | 1,1,1,1,1,1 MSR, LTEATDD, 5G NR: 0,0,0,0,0,0 | 0,0,0,0,0,0
State Saved	Saved in instrument state
Range	Integ BW | RRC Weighted

Filter Alpha

Sets the alpha value for the RRC Filter for each offset.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:FILTer:ALPHa <real>,…`
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:FILTer:ALPHa?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS:INN:LIST:FILT:ALPH 0.5,0.5,0.5,0.5,0.5,0.5` `:ACP:OFFS:INN:LIST:FILT:ALPH?`
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is 0.22 0.22,0.22,0.22,0.22,0.22,0.22|0.22,0.22,0.22,0.22,0.22,0.22
State Saved	Saved in instrument state
Min/Max	0.01/1.00

Advanced (Inner Offset)

Opens a further menu page that lets you set advanced properties of the Inner Offset, such as Res BW, Video BW, Filter and "Power Ref" on page 676 parameters.

Offset Freq

The same as "Offset Freq" on page 662 in the main **Inner Offset** menu.

Res BW

Sets the Resolution Bandwidth. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:RESolution <freq>,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:RESolution?`

	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink
Example	`:ACP:OFFS2:INN:LIST:BAND:RES 220kHz,220kHz,220kHz,220kHz,220kHz,220kHz` `:ACP:OFFS2:INN:LIST:BAND:RES?`
Dependencies	When "Meas Method" on page 582 is RBW, FAST or Fast Power, this control is grayed-out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent SCPI remote command is sent, a "Setting conflict" warning is generated
Couplings	When "Res BW" on page 553 Mode is **Auto**, this value is exactly the same as **Res BW**. When you change this value, **Res BW** Mode also changes to **Man**
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is 100 kHz 100 kHz, 100 kHz, 100k Hz, 100 kHz | 100 kHz,100 kHz, 100 kHz,100 kHz, 100 kHz, 100 kHz
State Saved	Saved in instrument state
Min/Max	1 Hz/8 MHz

Auto Function

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:RESolution:AUTO ON | OFF | 1 | 0,…`
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:RESolution:AUTO?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS2:INN:LIST:BAND:RES:AUTO 1,1,1,1,1,1` `:ACP:OFFS2:INN:LIST:BAND:RES:AUTO?`
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is 1 1, 1, 1, 1, 1, 1
State Saved	Yes

Video BW

Lets you change the instrument post-detection filter (VBW).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:VIDeo <freq>,…`
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:VIDeo?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS2:INN:LIST:BAND:VID 5MHz,5MHz,5MHz,5MHz,5MHz,5MHz` `:ACP:OFFS2:INN:LIST:BAND:VID?`
Notes	The values shown in this table reflect the conditions after **Mode Preset**
Dependencies	When "Meas Method" on page 582 is RBW, FAST or Fast Power, this cell is grayed-out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is 1 MHz 1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz

State Saved	Yes
Min/Max	1 Hz/50 MHz

Auto Function

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:VIDeo:AUTO OFF | ON | 0 | 1,…`
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:VIDeo:AUTO?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS2:INN:LIST:BAND:VID:AUTO 0,0,0,0,1,1` `:ACP:OFFS2:INN:LIST:BAND:VID:AUTO?`
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is `ON ON, ON, ON, ON, ON, ON`
State Saved	Yes

Filter Type

Selects the type of bandwidth filter that is used.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:SHAPe GAUSsian | FLATtop,…`
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:SHAPe?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS2:INN:LIST:BAND:SHAP FLAT,GAUS,GAUS,GAUS,GAUS,GAUS` `:ACP:OFFS2:INN:LIST:BAND:SHAP?`
Dependencies	When "Res BW" on page 553 Mode for the offset is **Auto**, this cell is grayed-out and disabled. Since **Res BW** Mode for the offset is preset to **Auto** on changing "Meas Method" on page 582 to RBW, FAST or Fast Power, this cell is grayed-out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is `GAUSsian GAUSsian, GAUSsian, GAUSsian, GAUSsian, GAUSsian, GAUSsian`
State Saved	Saved in instrument state
Range	`GAUSsian|FLATtop`

Filter BW

Selects a Gaussian filter based on its –3 dB (Normal) bandwidth or its –6 dB bandwidth.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:TYPE DB3 | DB6,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:TYPE?`

	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink
Example	`:ACP:OFFS2:INN:LIST:BAND:TYPE DB3,DB3,DB3,DB3,DB3,DB3` `:ACP:OFFS2:INN:LIST:BAND:TYPE?`
Dependencies	When "RBW Filter Type" on page 556 is `FLATtop` or "Res BW" on page 553 Mode for the offset is **Auto**, this cell is grayed-out and disabled. Since **Res BW** Mode for the offset is preset to **Auto** on changing "Meas Method" on page 582 to RBW, FAST or Fast Power, this cell is also grayed-out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is `DB3` `DB3, DB3, DB3, DB3, DB3, DB3`
State Saved	Saved in instrument state
Range	–3 dB (Normal) | –6 dB

Power Ref Type

Lets you set reference types of inner offsets.

`CUMulative` Cumulated power of the upper and lower sub-block carriers is the reference level. This selection is effective only when one of the following "Power Ref" on page 676 values is selected:

Left & Right Carriers	`LRCarriers`
Max Power Carrier in Sub-block	`MPCSubblock`
Min Power Carrier in Sub-block	`MINSubbloc`
Left & Right Sub-blocks	`LRSubblocks`
Manual	`MANual`

When one of the other **Power Ref** values is selected, carrier powers are not cumulated, and the reference level is equivalent to Normal

`NORMal` Power of specified carrier or the manual reference level is the reference level

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:PREFerence CUMulative | NORMal, …`
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:PREFerence?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS:INN:LIST:PREF CUM,CUM,NORM,NORM,NORM,NORM` `:ACP:OFFS:INN:LIST:PREF?`
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is `NORMal` `NORMal, NORMal, NORMal, NORMal, NORMal, NORMal`
State Saved	Saved in instrument state
Range	`CUMulative|NORMal`

Auto Function

<table>
<tr><td>Remote Command</td><td><code>[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:PREFerence:AUTO OFF | ON | 0 | 1, …</code>

</table>

Inner Limits

Accesses a menu of functions that contains Select Offset, Abs Limit, Rel Limit and Fail Mask parameters.

Limit Test

This checkbox is the same as "Limit Test" on page 654 in the **Settings** tab.

Offset Freq

This column is the same as "Offset Freq" on page 662 in the **Offset** tab.

Abs Limit

Specifies an absolute limit value, which sets the absolute amplitude levels to test against for each of the custom offsets. The list must contain 6 entries. If there is more than one offset, the offset closest to the carrier channel is the first one in the list. `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe`.

The query returns the 6 sets of real numbers that are the current absolute amplitude test limits.

<table>
<tr><td>Remote Command</td><td><code>[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:ABSolute < real>,…</code>
<code>[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:ABSolute?</code>
Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink</td></tr>
<tr><td>Example</td><td><code>:ACP:OFFS2:INN:LIST:ABS -10,-10,-10,-10,-10,-10</code>
<code>:ACP:OFFS2:INN:LIST:ABS?</code></td></tr>
<tr><td>Preset</td><td>When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is the same as the Offset F value
<table>
<tr><th>Modes</th><th>Values</th></tr>
<tr><td>5G NR</td><td>-2.2, -2.2, -2.2, -2.2, -2.2, -2.2 | -50.0,-50.0,-50.0,-50.0,-50.0,-50.0</td></tr>
<tr><td>All Others</td><td>-8.45,-8.45,-8.45,-8.45,-8.45,-8.45 | -50.0,-50.0,-50.0,-50.0,-50.0,-50.0</td></tr>
</table></td></tr>
<tr><td>State Saved</td><td>Saved in instrument state</td></tr>
<tr><td>Min/Max</td><td>-200.0 dBm/50.0 dBm</td></tr>
</table>

Rel Limit (Car)

Specifies a relative limit value for the carrier level. This sets the amplitude levels to test against for the specified offsets.

The amplitude level is relative to the carrier amplitude. If multiple offsets are available, the list contains 6 entries. The offset closest to the carrier channel is the first one in the list. `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe`.

The query returns the 6 sets of real numbers that are the current amplitude test limits, relative to the carrier, for each offset.

Offset[n] n = 1 is base station and n = 2 is mobiles. The default is base station (1).

<table>
<tr><td>Remote Command</td><td><code>[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:RCARrier <real>,…</code>
<code>[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:RCARrier?</code>
Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink</td></tr>
<tr><td>Example</td><td><code>:ACP:OFFS2:INN:LIST:RCAR 0,0,0,0,0,0</code>
<code>:ACP:OFFS2:INN:LIST:RCAR?</code></td></tr>
<tr><td>Preset</td><td>When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is the same as the Offset F value
<table>
<tr><th>Modes</th><th>Values</th></tr>
<tr><td>5G NR</td><td>-43.8, -43.8, 43.8, -43.8, -43.8, -43.8 | -29.2, -29.2, -29.2, -29.2, -29.2, -29.2</td></tr>
<tr><td>All Others</td><td>-44.2, -44.2,-44.2,-44.2,-44.2,-44.2 | -29.2, -29.2, -29.2, -29.2, -29.2, -29.2</td></tr>
</table></td></tr>
<tr><td>State Saved</td><td>Saved in instrument state</td></tr>
<tr><td>Min/Max</td><td>-150/50.0</td></tr>
</table>

Rel Limit (PSD)

Specifies a relative limit value for the level of the power spectral density. This sets the amplitude levels to test against for any custom offsets. The amplitude level is relative to the power spectral density. If multiple offsets are available, the list contains 6 entries. The offset closest to the carrier channel is the first one in the list.

`[:SENSe]:ACP:OFFSet[n]:INNer:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe`.

The query returns the 6 sets of real numbers that are the current amplitude test limits, relative to the power spectral density, for each offset.

Offset[n] n = 1 is base station and n = 2 is mobiles. The default is base station (1).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:RPSDensity <rel_ampl>,…`
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:RPSDensity?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS2:INN:LIST:RPSD 10,10,10,10,10,10` `:ACP:OFFS2:INN:LIST:RPSD?`
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is 0 0, 0, 0, 0, 0, 0 | 0, 0, 0, 0, 0, 0
State Saved	Saved in instrument state
Min/Max	-150.0 dB/50.0 dB

Fail Mask

Accesses a menu that enables you to select one of the logics for the fail conditions between the measurement results and the test limits. The setting defines the type of testing to be done at any custom offset frequencies. The measured powers are tested against the absolute values defined with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:ABSolute`, or the relative values defined with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:RPSDensity` and `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:RCARrier`.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe`.

Option	SCPI	Description
Absolute	`ABSolute`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for Abs Limit
Relative	`RELative`	Fail is shown if one of the relative ACP measurement results is larger than the limit for Rel Lim (Car) or Rel Lim (PSD)
Abs AND Rel	`AND`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for Abs Limit *and* one of the relative ACP measurement results is larger than the limit for Rel Lim (Car) or Rel Lim (PSD)
Abs OR Rel	`OR`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for Abs Limit *or* one of the relative ACP measurement results is larger than the limit for Rel Lim (Car) or Rel Lim (PSD)

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:TEST ABSolute | AND | OR | RELative,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:TEST?`

	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink
Example	`:ACP:OFFS2:INN:LIST:TEST ABS,ABS,ABS,ABS,ABS,ABS` `:ACP:OFFS2:INN:LIST:TEST?`
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is `AND` `AND, AND, AND, AND, AND, AND | AND, AND, AND, AND, AND, AND`
State Saved	Saved in instrument state
Range	`ABSolute|AND|OR|RELative`

Max Num of Offsets

Sets the max number of offsets: either 6 or 12.

This setting applies only to SCPI operations. To specify the same behavior as that of the previous version, selecting 6 offsets is recommended. If you select 12 offsets, the results returned by the `:READ|:FETCh` queries increase accordingly.

Example:

When you select 6 offsets, querying the offset state returns 6 values, as below.

```
-> :SENSe:ACPower:OFFSet:LIST:STATe?
<- 1,0,0,0,0,0
```

When you select 12 offsets, sending the same query returns 12 values, as below.

```
-> :SENSe:ACPower:OFFSet:LIST:STATe?
<- 1,0,0,0,0,0,0,0,0,0,0,0
```

If your program depends on the number of returned values, you should select 6 offsets, or else change your program.

Remote Command	`[:SENSe]:ACPower:OFFSet:MAXNumber NUM6 | NUM12` `[:SENSe]:ACPower:OFFSet:MAXNumber?`
Example	`:ACP:OFFS:MAXN NUM12` `:ACP:OFFS:MAXN?`
Preset	`NUM6`
State Saved	Saved in instrument state
Range	6|12

Limit Test

Turns limit checking for each offset On or Off. The limits may be specified in the **Offset** menu, for each offset, both sides of the carrier. For results that fail the limit, a red F is appended. In the **Combined** view, the bar turns red.

Remote Command	`:CALCulate:ACPower:LIMit:STATe OFF | ON | 0 | 1` `:CALCulate:ACPower:LIMit:STATe?`
Example	`:CALC:ACP:LIM:STAT OFF` `:CALC:ACP:LIM:STAT?`
Preset	SA: `OFF` WCDMA, LTEAFDD, LTEATDD, 5G NR, MSR: `ON`
State Saved	Saved in instrument state
Range	`ON|OFF`
Backwards Compatibility SCPI	`[:SENSe]:MCPower:LIMit[:STATe]` `[:SENSe]:ACPower:LIMit[:STATe]`

Spur Avoidance

Because VXT models M9410A/11A/15A are direct-conversion (zero-IF) receivers, feedthrough leakage from the local oscillator appears as a spurious signal (spur) at the center frequency. The **Spur Avoidance** function is provided to eliminate this spur, at the expense of some measurement speed.

When **Spur Avoidance** is enabled (the default), the instrument uses a software algorithm to remove this spur from the displayed measurement data, but the algorithm only operates under certain conditions. Specifically, it only operates in multiple capture case.

You can disable this function to speed up your measurement by setting **Spur Avoidance** to **Disabled**.

Note that when **Spur Avoidance** is not in effect, either because you have disabled it or because you are not in multiple capture, the following warning message appears in the status bar:

```
Settings Alert;Spur Avoidance Off
```

This is to alert you that measurement accuracy might be impacted by the fact that **Spur Avoidance** is not in effect.

Remote Command	`[:SENSe]:ACPower:SAVoid[:STATe] ON | OFF | 0 | 1` `[:SENSe]:ACPower:SAVoid[:STATe]?`
Example	`:ACP:SAVoid ON` `:ACP:SAVoid?`
Dependencies	Only appears in VXT models M9410A/11A/15A
Preset	`OFF`

State Saved	Saved in instrument state
Range	`ON|OFF`

Meas Setup Summary Table

Lets you view and access many of the parameters in the **Meas Setup** menus on one screen.

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "Measurement-Specific Details" on page 636 below.

Remote Command	`:COUPle ALL`
Example	`:COUP ALL`
Backwards Compatibility SCPI	`:COUPLE ALL | NONE`
Backwards Compatibility Notes	`:COUP:NONE` puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is *not* recommended for making measurements or new designs

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter’s coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple***does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all measurement parameters to their default values.

Remote Command	`:CONFigure:ACPower`
Example	`:CONF:ACP`
Couplings	Selecting **Meas Preset** restores all measurement parameters to their default values

3.4.13.2 Reference

All ACP measurements are taken relative to a specific carrier frequency, relative to whose power the offset channel power is measured.

The controls on this tab let you specify the reference carrier frequency and other parameters relevant to the reference carrier.

Carrier/Offset/Limits Config

This is the same dialog as "Carrier/Offset/Limits Config" on page 583 in the **Settings** menu.

Number of Carriers

This is the same as **Number of Carriers [Mode: all but LTEAFDD, LTEATDD, MSR, 5GNR]** under **Reference**.

Couple to #1

Couples carrier settings to carrier #1. The coupled parameters are:

- "Carrier Pwr Present" on page 638
- "Carrier Spacing" on page 639
- "Measurement Noise Bandwidth" on page 640
- "Method for Carrier " on page 641
- "Filter Alpha for Carrier" on page 641

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:COUPle OFF | ON | 0 | 1, …` `[:SENSe]:ACPower:CARRier[1]|2:LIST:COUPle?`

	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink
Example	`:ACP:CARR:LIST:COUP OFF` `:ACP:CARR:LIST:COUP?`
Notes	Some modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored For LTEAFDD or LTEATDD Modes, this control is not shown. In order to maintain backwards compatibility with legacy LTE FDD/TDD, the SCPI command is supported in LTE & LTE-A converged applications
Couplings	When `ON`, the carrier settings are coupled to carrier #1. Coupled parameters are: Carrier Power Present, Carrier Spacing, Measurement Noise Bandwidth, Method and Filter Alpha When a setting is changed, coupling is switched off automatically Carrier #1 is always set to `ON` and cannot be changed
Preset	`ON`
State Saved	Saved in instrument state

Carrier Pwr Present

Configures the carriers for this measurement. Allows spaces to be inserted between carriers. Carriers with the power present parameter set to `YES` are carriers, and those with the power present parameter set to `NO` are spaces. Each carrier power present is set to `YES` or `NO`. The individual carrier can be set by selecting the desired carrier.

The query returns the current values for all of the carriers. If a carrier is defined as having no power present, the power displayed is relative to the reference carrier, otherwise the absolute power is displayed.

If you change the carrier power present to `NO`, and that carrier is currently configured as the reference carrier, the next carrier to the left (or the right if there are no carriers to the left) is assigned as the reference carrier. This also applies to the scenario where there are only two carriers configured as having power present, and you configure only one carrier to have no power present.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:PPResent YES | NO, …`
	`[:SENSe]:ACPower:CARRier[1]|2:LIST:PPResent?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:CARR2:LIST:PPR YES` `:ACP:CARR2:LIST:PPR?`
Notes	Some Modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the carrier. Missing values are not permitted, so if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged, unless the number of values sent is greater than the number of

	carriers, then subsequent values are ignored For LTEAFDD or LTEATDD Modes, this control is not shown. To maintain backwards compatibility with legacy LTE FDD/TDD Modes, the SCPI command is supported in the LTE & LTE-A converged applications
Couplings	Coupled to number of carriers. When the SCPI command is sent, the number of carriers is set to the number of entries in the parameter list
Preset	`YES`
State Saved	Saved in instrument state
Backwards Compatibility SCPI	`[:SENSe]:MCPower:CARRier[1]|2:LIST:PPResent`

Carrier Spacing

Sets the width of the carrier spacing. This is the value applied to all the current slots, whether they are carriers or spaces.

Enter each carrier spacing value individually by selecting the desired carrier, and then enter the carrier width.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:WIDTh <freq>, …`
	`[:SENSe]:ACPower:CARRier[1]|2:LIST:WIDTh?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:CARR2:LIST:WIDT 25kHz` `:ACP:CARR2:LIST:WIDT?`
Notes	Some Modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the carrier. Missing values are not permitted, so if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged, unless the number of values sent is greater than the number of carriers, then subsequent values are ignored For LTEAFDD or LTEATDD Modes, this control is not shown. To maintain backwards compatibility with legacy LTE FDD/TDD Modes, the SCPI command is supported in the LTE & LTE-A converged applications
Couplings	Coupled to number of carriers. When the SCPI command is sent, the number of carriers is set to the number of entries in the parameter list Changing Carrier Spacing might affect "Span" on page 569
Preset	SA, WCDMA, LTE, LTETDD Modes: 5 MHz Radio Test Mode: 25 kHz

State Saved	Saved in instrument state
Min/Max	0 Hz/Depends on instrument maximum frequency. Same as the Max Span of Swept SA Measurement
Backwards Compatibility SCPI	`[:SENSe]:MCPower:CARRier[1]|2:LIST:WIDTh`

Measurement Noise Bandwidth

Specifies the **Measurement Noise Bandwidth** used to calculate the power in the carriers.

Each **Measurement Noise Bandwidth** value is entered individually by selecting the desired carrier. Enter the measurement noise bandwidth on the **Carrier** page of the **Carr/Offset/Limits Config** dialog.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:BANDwidth[:INTegration] <freq>, …`
	`[:SENSe]:ACPower:CARRier[1]|2:LIST:BANDwidth[:INTegration]?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:CARR2:LIST:BAND 25kHz` `:ACP:CARR2:LIST:BAND?`
Notes	In WCDMA Mode, the preset/default value is defined as 3.84 MHz, but internally, 4.6848 MHz is used as the default value Some Modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the carrier. Missing values are not permitted, so if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged, unless the number of values sent is greater than the number of carriers, then subsequent values are ignored For LTEAFDD or LTEATDD Modes, this control is not shown. In order to maintain backwards compatibility with legacy LTE FDD/TDD Modes, the SCPI command is supported in the LTE & LTE-A converged applications
Couplings	Coupled to number of carriers. When the SCPI command is sent, the number of carriers is set to the number of entries in the parameter list
Preset	

Modes	Value
SA	2 MHz
WCDMA	3.84 MHz
LTE, LTETDD	4.515 MHz|4.5 MHz
Radio Test	25 kHz

State Saved	Saved in instrument state
Min/Max	10 Hz/Depends on instrument maximum frequency. Same as Max Span of the Swept SA Measurement

Backwards Compatibility SCPI	`[:SENSe]:ACPower:BANDwidth:INTegration`
	`[:SENSe]:ACPower:BWIDth:INTegration`
	`[:SENSe]:ACPower:CARRier[1]|2:LIST:BWIDth[:INTegration]`
	`[:SENSe]:MCPower:CARRier[1]|2:LIST:BANDwidth[:INTegration]`
	`[:SENSe]:MCPower:CARRier[1]|2:LIST:BWIDth[:INTegration]`

Method for Carrier

Accesses the carrier configuration method settings.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:FILTer[:RRC][:STATe] ON | OFF | 1 | 0, …`
	`[:SENSe]:ACPower:CARRier[1]|2:LIST:FILTer[:RRC][:STATe]?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:CARR:LIST:FILT 0,0,0,0` `:ACP:CARR:LIST:FILT?`
Notes	The binary values translate as follows: `1|ON` – RRC Weighted `0|OFF` – Integ BW Maximum of Array length depends on the number of carriers Some Modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored For LTEAFDD or LTEATDD Modes, this control is not shown. In order to maintain backwards compatibility with legacy LTE FDD/TDD Modes, the SCPI command is supported in the LTE & LTE-A converged applications
Preset	see table below
State Saved	Saved in instrument state
Range	Integration BW | RRC Weighted

Notes – binary values:

`1|ON`	RRC Weighted
`0|OFF`	Integ BW

Preset:

Modes	Value
SA, LTE, LTETDD	`OFF`
WCDMA	`ON`
Radio Test	`OFF`

Filter Alpha for Carrier

Inputs the alpha value for the filter used in the current carrier configuration.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:FILTer:ALPHa <real>, …`

	`[:SENSe]:ACPower:CARRier[1]|2:LIST:FILTer:ALPHa?` Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink
Example	`:ACP:CARR2:LIST:FILT:ALPH 0.5` `:ACP:CARR2:LIST:FILT:ALPH?`
Notes	Some Modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored For LTEAFDD or LTEATDD Modes, this control is not shown. In order to maintain backwards compatibility with legacy LTE FDD/TDD Modes, the SCPI command is supported in the LTE & LTE-A converged applications
Preset	0.22
State Saved	Saved in instrument state
Min/Max	0.01/1.0

Offset

Lets you configure the spacing of the offset regions.

Offset Frequency Define

Lets you select offset frequency definition. Each standard defines each offset frequency from Carrier.

For example, 3GPP2 requires the “From Carrier Center to Integ BW Closer Edge” definition. LTE conformance test requires “From Carrier Edge to Integ BW Center” and/or “From Carrier Edge to Integ BW Closer Edge” definition.

`CTOCenter`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the center frequency of each Offset Integ BW
`CTOEdge`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the closest edge frequency of each Offset Integ BW
`ETOCenter`	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the center frequency of each Offset Integ BW
`ETOEdge`	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the closest edge of each Offset Integ BW
`RTOCenter` 5G NR Mode only	From either the lower or upper RF BW** edge frequency to the center frequency of each Offset Integ BW
`RTOEdge` 5G NR Mode only	From either the lower or upper RF BW** edge frequency to the closest edge frequency of each Offset Integ BW
`RCTOCenter`	From the center frequency of RF BW** to the center frequency of each Offset Integ BW

5G NR Mode only	
`SCTOCenter` 5G NR Mode only	From the center frequency of sub-block** to the center frequency of each Offset Integ BW

** RF BW = BWchannel,CA which is defined in each 3GPP standard, regardless of "Measure Carrier" for the uppermost and the lowermost carriers being Enabled or Disabled. When the Number of Component Carrier = 1, RF BW = $BW_{channel}$ = 2 x $F_{offset,RAT}$

** sub-block (bandwidth) = $BW_{channel,block}$ which is defined in each 3GPP standard, regardless of "Measure Carrier" for the uppermost and the lowermost carriers being Enabled or Disabled. When the Number of Component Carrier within each sub-block = 1, sub-block (bandwidth) = $BW_{channel}$ = 2 x $F_{offset,RAT}$.

See "Diagrams for Offset Freq Define" on page 644.

Modes other than MSR, LTEAFDD, LTEATDD, 5G NR

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE CTOCenter | CTOEdge | ETOCenter | ETOEdge`
	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS:TYPE ETOC` `:ACP:OFFS:TYPE?`
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	`CTOCenter`
State Saved	Saved in instrument state
Range	`CTOCenter|CTOEdge|ETOCenter|ETOEdge`

Mode: MSR, LTEAFDD, LTEATDD

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE CTOCenter | CTOEdge | ETOCenter | ETOEdge`
	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS:TYPE ETOC` `:ACP:OFFS:TYPE?`
Preset	`CTOCenter`
State Saved	Saved in instrument state
Range	`CTOCenter|CTOEdge|ETOCenter|ETOEdge`

Mode: 5G NR

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE CTOCenter | CTOEdge | ETOCenter | ETOEdge | RTOCenter | RTOEdge | RCTOCenter | SCTOCenter`
	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS:TYPE ETOC` `:ACP:OFFS:TYPE?`
Preset	`CTOCenter`
State Saved	Saved in instrument state
Range	`CTOCenter | CTOEdge | ETOCenter | ETOEdge | RTOCenter | RTOEdge | RCTOCenter | SCTOCenter`

Diagrams for Offset Freq Define

Details depend on the selected mode.

Diagram for Modes other than MSR, LTEAFDD, LTEATDD, 5G NR

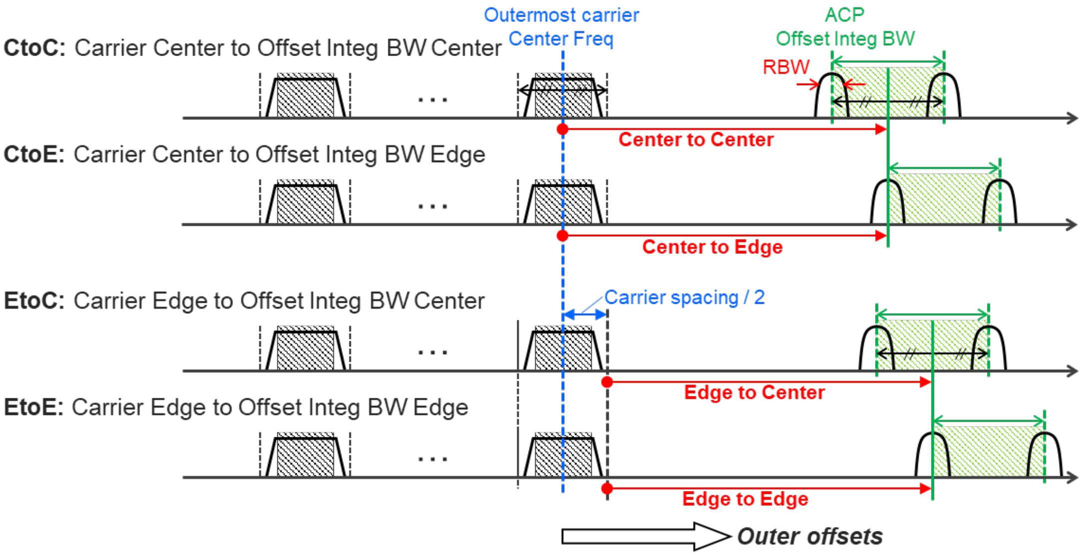

Diagram for MSR, LTEAFDD, LTEATDD, 5G NR

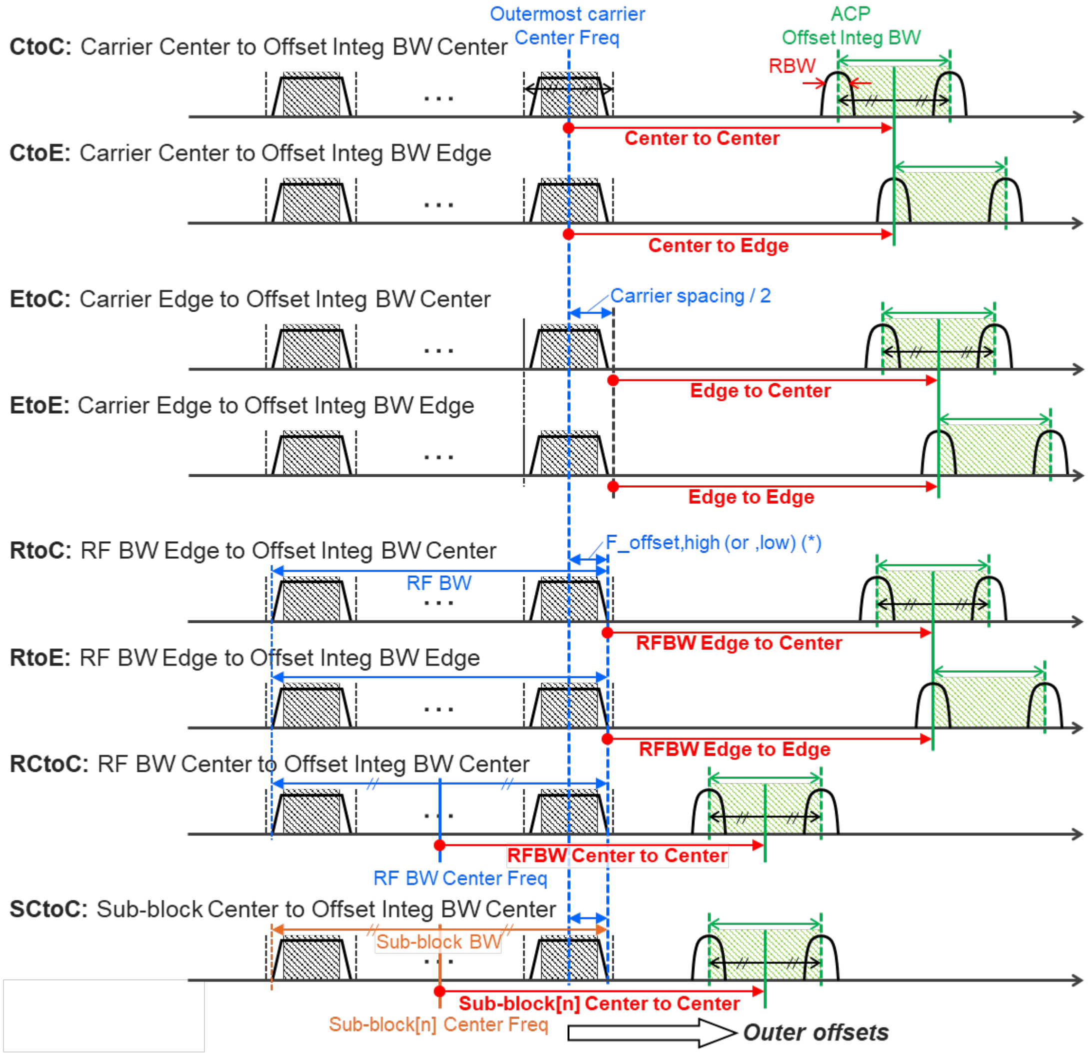

Note:

RF BW Edge and Outermost Carrier Edge are not always the same.
e.g.) 5G NR (3GPP) defines BW_channel, CA which calculates F_offset,high and F_offset,low asymmetrically with SCS shift.
(*) For MSR, F_offset,high (or ,low) = F_offset,RAT,high (or ,low)

Offset Freq

Determines the frequency difference between the center of the main channel and the center of the carrier.

Each **Offset Freq** state value is entered individually by selecting the desired carrier.

The list contains up to six (6) entries, depending on the mode selected, for offset frequencies. Each offset frequency in the list corresponds to a reference bandwidth in the bandwidth list.

An offset frequency of zero turns the display of the measurement for that offset off, but the measurement is still made and reported. You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet:LIST:STATe`.

Turning the offset off has the same effect as setting the frequency of the offset to 0 Hz, and causes it to be removed from the results screen.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST[:FREQuency] <freq>,…`
	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST[:FREQuency]?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS1:LIST 0,0,0,0,0,0` `:ACP:OFFS1:LIST?`
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the offset. Missing values are not permitted, unless the number of values sent is greater than the number of carriers, in which case subsequent values are ignored
Couplings	Changing Offset Frequency might affect "Span" on page 569
Preset	When "Max Num of Offsets" on page 633 is set to 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
SA	3 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz, 0 Hz | 3 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz, 0 Hz
WCDMA	5.0 MHz, 10.0 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz | 5.0 MHz, 10.0 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz
LTEAFDD, LTEATDD, MSR	5.0 MHz, 10.0 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz | 5.0 MHz, 10.0 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz
5G NR	100 MHz, 200 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz | 100 MHz, 200 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz
Radio Test	25 kHz, 50 kHz, 75 kHz, 0 Hz, 0 Hz, 0 Hz

State Saved	Saved in instrument state
Min/Max	0 Hz/Depends on instrument maximum frequency. Same as Max Span of the Swept SA Measurement
Backwards Compatibility SCPI	`[:SENSe]:MCPower:OFFSet[1]|2:LIST[:FREQuency]`

Auto Function

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:STATe OFF | ON | 0 | 1,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:STATe?`

<table>
<tr><td></td><td>Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink</td></tr>
<tr><td>Example</td><td><code>:ACP:OFFS2:LIST:STAT 1,1,0,0,0,0</code>
<code>:ACP:OFFS2:LIST:STAT?</code></td></tr>

Integ BW

Sets the Integration Bandwidth for the offsets. Each resolution bandwidth in the list corresponds to an offset frequency in the list defined by `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST[:FREQuency]`.

Enter each value individually by selecting the desired offset, then enter the Offset Integration Bandwidth.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe`.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth[:INTegration] <freq>,…`
	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth[:INTegration]?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS2:LIST:BAND 2MHz,2MHz,2MHz,2MHz,2MHz,2MHz` `:ACP:OFFS2:LIST:BAND?`
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the offset. Missing values are not permitted, so, if you want to change the second value, you must send all values up to that. Subsequent values remain unchanged, unless the number of values sent is greater than the number of carriers, then subsequent values is ignored
Couplings	Changing **Integ BW** might affect "Span" on page 569

<table>
<tr><td>Preset</td><td>When "Max Num of Offsets" on page 633 is set to 12, the preset value of Offset G ~ L is the same as the Offset F value
<table>
<tr><th>Modes</th><th>Values</th></tr>

<code>[:SENSe]:ACPR:OFFSet[1]|2:LIST:BANDwidth</code>
<code>[:SENSe]:ACPR:OFFSet[1]|2:LIST:BWIDth</code>
<code>[:SENSe]:MCPower:OFFSet[1]|2:LIST:BANDwidth[:INTegration]</code>
<code>[:SENSe]:MCPower:OFFSet[1]|2:LIST:BWIDth[:INTegration]</code></td></tr>
</table>

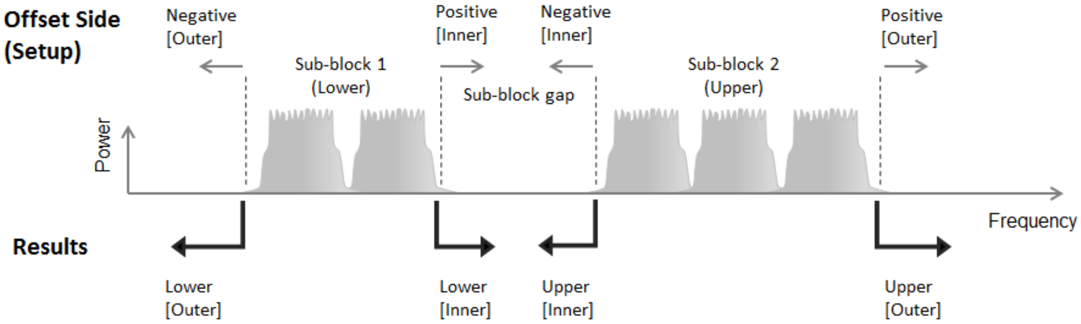
Offset Side

Specifies which offset side to measure.

You can turn off (not use) specific offsets with `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:SIDE`.

`NEGative`	Negative (lower) sideband only
`BOTH`	Both of the negative (lower) and positive (upper) sidebands
`POSitive`	Positive (upper) sideband only

The figure below shows the relation between the negative/positive offset side setups and the upper/lower results in MSR, LTEAFDD and LTEATDD Modes.



Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:SIDE NEGative | BOTH | POSitive, …`
	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:SIDE?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS:LIST:SIDE BOTH` `:ACP:OFFS:LIST:SIDE?`
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored If you set `POS` or `NEG` in an offset, result of the inactive side returns -999
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is `BOTH` `BOTH, BOTH, BOTH, BOTH, BOTH, BOTH | BOTH, BOTH, BOTH, BOTH, BOTH, BOTH`
State Saved	Saved in instrument state
Range	`NEGative|BOTH|POSitive`

Method

Allows you to turn RRC filtering of each offset on or off. The value (roll off) for the filter will be set to the value of the **Filter Alpha** parameter.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:FILTer[:RRC][:STATe] ON | OFF | 1 | 0,…`
	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:FILTer[:RRC][:STATe]?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS:LIST:FILT 1,0,0` `:ACP:OFFS:LIST:FILT?`
Notes	`1|ON` = RRC Weighted, `0|OFF` = Integ BW Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is the same as the Offset F value

<table>
<tr><td></td><td>
<table>
<tr><th>Mode</th><th>Values</th></tr>
<tr><td>SA</td><td>0, 0, 0, 0, 0, 0 | 0, 0, 0, 0, 0,0</td></tr>

</td></tr>
<tr><td>State Saved</td><td>Saved in instrument state</td></tr>
<tr><td>Min/Max</td><td>0.01/1.00</td></tr>
</table>

Advanced (Offset)

Opens a further menu page, which lets you set advanced properties of the Inner Offset, such as Res BW, Video BW, and Filter parameters.

Offset Freq

This column is the same as "Offset Freq" on page 645 in the main **Offset** menu.

Res BW

Sets the resolution bandwidth. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

<table>
<tr><td>Remote Command</td><td><code>[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:RESolution <freq>,…</code>
<code>[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:RESolution?</code>
Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink</td></tr>
<tr><td>Example</td><td><code>:ACP:OFFS2:LIST:BAND:RES 220kHz,220kHz,220kHz,220kHz,220kHz,220kHz</code>
<code>:ACP:OFFS2:LIST:BAND:RES?</code></td></tr>
<tr><td>Notes</td><td>Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored</td></tr>
<tr><td>Dependencies</td><td>When "Meas Method" on page 582 is RBW, FAST or Fast Power, this cell is grayed-out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent SCPI remote command is sent, a "Setting conflict" warning is generated</td></tr>
<tr><td>Couplings</td><td>When Res BW Mode is Auto, this value is exactly same as Res BW. When you change this value, Res BW Mode also changes to Man</td></tr>
<tr><td>Preset</td><td>When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is the same as the Offset F value
<table>
<tr><td>SA</td><td>220 kHz, 220 kHz, 220 kHz, 220 kHz, 220 kHz, 220 kHz</td></tr>
<tr><td>WCDMA</td><td>100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz</td></tr>
<tr><td>LTEAFDD, LTEATDD, 5G NR, MSR</td><td>100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz | 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz</td></tr>
</table></td></tr>
<tr><td>State Saved</td><td>Saved in instrument state</td></tr>
<tr><td>Min/Max</td><td>1 Hz/8 MHz</td></tr>

</table>

Auto Function

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:RESolution:AUTO ON | OFF | 1 | 0,…`
	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:RESolution:AUTO?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS2:LIST:BAND:RES:AUTO 1,1,1,1,1,1` `:ACP:OFFS2:LIST:BAND:RES:AUTO?`
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is 1 1, 1, 1, 1, 1, 1
State Saved	Yes

Backwards Compatibility SCPI	`[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:RESolution:AUTO`

Video BW

Enables you to change the instrument post-detection filter (VBW).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:VIDeo <freq>,…`
	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:VIDeo?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS2:LIST:BAND:VID 5MHz,5MHz,5MHz,5MHz,5MHz,5MHz` `:ACP:OFFS2:LIST:BAND:VID?`
Notes	The values shown in this table reflect the conditions after **Mode Preset** Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Dependencies	When "Meas Method" on page 582 is RBW, FAST or Fast Power, this cell is grayed-out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	**Values**
SA	22 kHz, 22 kHz, 22 kHz, 22 kHz, 22 kHz, 22 kHz
WCDMA	1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz
LTEAFDD, LTEATDD, 5G NR, MSR	1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz

State Saved	Saved in instrument state
Min/Max	1 Hz/50 MHz
Backwards Compatibility SCPI	`[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:VIDeo`

Auto Function

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:VIDeo:AUTO OFF | ON | 0 | 1,…`
	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:VIDeo:AUTO?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS2:LIST:BAND:VID:AUTO 0,0,0,0,1,1` `:ACP:OFFS2:LIST:BAND:VID:AUTO?`
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is `ON` `ON, ON, ON, ON, ON, ON`

State Saved	Yes
Backwards Compatibility SCPI	`[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:VIDeo:AUTO`

Filter Type

Selects the type of bandwidth filter that is used.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:SHAPe GAUSsian | FLATtop,…`
	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:SHAPe?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS2:LIST:BAND:SHAP FLAT,GAUS,GAUS,GAUS,GAUS,GAUS` `:ACP:OFFS2:LIST:BAND:SHAP?`
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Dependencies	When "Res BW" on page 553 Mode for the offset is **Auto**, this cell is grayed out and disabled. Since **Res BW** Mode for the offset is preset to **Auto** on changing "Meas Method" on page 582 to RBW, FAST or Fast Power, this cell is grayed-out and disabled too. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is `GAUSsian` `GAUSsian, GAUSsian, GAUSsian, GAUSsian, GAUSsian, GAUSsian`
State Saved	Saved in instrument state
Range	`GAUSsian|FLATtop`
Backwards Compatibility SCPI	`[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:SHAPe`

Filter BW

Selects a Gaussian filter based on its –3 dB (Normal) bandwidth or its –6 dB bandwidth.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:TYPE DB3 | DB6,…`
	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:TYPE?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS2:LIST:BAND:TYPE DB3,DB3,DB3,DB3,DB3,DB3` `:ACP:OFFS2:LIST:BAND:TYPE?`
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored

Dependencies	When "RBW Filter Type" on page 556 is Flattop, or "Res BW" on page 553 Mode for the offset is **Auto**, this cell is grayed-out and disabled. Since **Res BW** Mode for the offset is preset to **Auto** on changing "Meas Method" on page 582 to RBW, FAST or Fast Power, this cell is grayed-out and disabled too. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is `DB3` `DB3, DB3, DB3, DB3, DB3, DB3`
State Saved	Saved in instrument state
Range	–3 dB (Normal)| –6 dB
Backwards Compatibility SCPI	`[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:TYPE`

Limits

Lets you configure the limits that are used to determine whether the offset regions `PASS` or `FAIL` the limit test.

Limit Test

This checkbox is the same as "Limit Test" on page 654 in the **Meas Setup, Settings** tab.

Offset Freq

This column is the same as "Offset Freq" on page 645 in the **Offset** index tab.

Abs Limit

Specifies an absolute limit value, which sets the absolute amplitude levels to test against for each of the custom offsets. The list must contain 6 entries. If there is more than one offset, the offset closest to the carrier channel is the first one in the list. `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with the `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe` command.

The query returns the six (6) sets of real numbers that are the current absolute amplitude test limits.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:ABSolute < real>,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:ABSolute?`

<table>
<tr><td></td><td>Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink</td></tr>
<tr><td>Example</td><td><code>:ACP:OFFS2:LIST:ABS -10,-10,-10,-10,-10,-10</code>
<code>:ACP:OFFS2:LIST:ABS?</code></td></tr>
<tr><td>Notes</td><td>Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored</td></tr>
<tr><td>Preset</td><td>When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is the same as the Offset F value
<table>
<tr><th>Modes</th><th>Values</th></tr>
<tr><td>SA</td><td>0dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm | 0dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm</td></tr>
<tr><td>WCDMA</td><td>50 dBm, 50 dBm, 50 dBm, 50 dBm, 50 dBm, 50 dBm | 50 dBm, 50 dBm, 50 dBm, 50 dBm, 50 dBm, 50 dBm</td></tr>
<tr><td>LTEAFDD, LTEATDD, MSR</td><td>-8.45, -8.45, -8.45, -8.45, -8.45, -8.45 | -50.0, -50.0, -50.0, -50.0, -50.0, -50.0</td></tr>
<tr><td>5G NR</td><td>4.92, 4.92, 4.92, 4.92, 4.92, 4.92 | -50.0, -50.0, -50.0, -50.0, -50.0, -50.0</td></tr>
</table></td></tr>
<tr><td>State Saved</td><td>Saved in instrument state</td></tr>
<tr><td>Min/Max</td><td>-200.0 dBm/50.0 dBm</td></tr>
<tr><td>Backwards Compatibility SCPI</td><td><code>[:SENSe]:ACPR:OFFSet[1]|2:LIST:ABSolute</code>
SA, W-CDMA
<code>[:SENSe]:MCPower:OFFSet[1]|2:LIST:ABSolute</code>
SA, W-CDMA</td></tr>
</table>

Rel Limit (Car)

Enters a relative limit value for the carrier level. This sets the amplitude levels to test against for the specified offsets.

The amplitude level is relative to the carrier amplitude. If multiple offsets are available, the list contains 6 entries. The offset closest to the carrier channel is the first one in the list.

`[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe`.

The query returns the 6 sets of real numbers that are the current amplitude test limits, relative to the carrier, for each offset.

Offset[n] n = 1 is base station and n = 2 is mobiles. The default is base station (1).

Remote	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:RCARrier <real>,…`

Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:RCARrier?` Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink
Example	`:ACP:OFFS2:LIST:RCAR 0,0,0,0,0,0` `:ACP:OFFS2:LIST:RCAR?`
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
SA	-45, -60, 0, 0, 0, 0 | -45, -60, 0, 0, 0, 0
WCDMA	-44.2, -49.2, -49.2, -49.2, -49.2, -49.2 | -32.2, -42.2, -42.2, -42.2, -42.2, -42.2

Radio Test	-60, -60, -60, 0, 0, 0

State Saved	Saved in instrument state
Min/Max	-150/50.0
Backwards Compatibility SCPI	`[:SENSe]:MCPower:OFFSet[1]|2:LIST:RCARrier`

Positive Offset Limit (Remote Command only)

Enables you to set the upper limit for the upper segment of the specified offset pair.

Remote Command	`:CALCulate:ACPower:OFFSet[1]|2[:OUTer]:LIST:LIMit:POSitive[:UPPer]:DATA <real>,...`
	`:CALCulate:ACPower:OFFSet[1]|2[:OUTer]:LIST:LIMit:POSitive[:UPPer]:DATA?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:CALC:ACP:OFFS:LIST:LIM:POS:DATA 0,0,0,0,0,0` `:CALC:ACP:OFFS:LIST:LIM:POS:DATA?`
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
SA	-45, -60, 0, 0, 0, 0 | -45, -60, 0, 0, 0, 0
WCDMA	-44.2, -49.2, -49.2, -49.2, -49.2, -49.2 | -32.2, -42.2, -42.2, -42.2, -42.2, -42.2
LTEAFDD, LTEATDD, MSR	-44.2,-44.2,-44.2,-44.2,-44.2,-44.2 | -29.2, -29.2, -29.2, -29.2, -29.2, -29.2
5G NR	-43.8, -43.8, -43.8, -43.8, -43.8, -43.8 | -29.2, -29.2, -29.2, -29.2, -29.2, -29.2
Radio Test	-60, -60, -60, 0, 0, 0

State Saved	Saved in instrument state
Min/Max	-150.0/50.0
Backwards Compatibility SCPI	`:CALCulate:MCPower:OFFSet:LIST:LIMit:POSitive[:UPPer]:DATA` (Power Suite)

Negative Offset Limit(Remote Command only)

Enables you to set the upper limit for the lower segment of the specified offset pair.

Remote Command	`:CALCulate:ACPower:OFFSet[1]|2[:OUTer]:LIST:LIMit:NEGative[:UPPer]:DATA <real>,...`
	`:CALCulate:ACPower:OFFSet[1]|2[:OUTer]:LIST:LIMit:NEGative[:UPPer]:DATA?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:CALC:ACP:OFFS:LIST:LIM:NEG:DATA 0,0,0,0,0,0` `:CALC:ACP:OFFS:LIST:LIM:NEG:DATA?`
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
SA	-45, -60, 0, 0, 0, 0 | -45, -60, 0, 0, 0, 0
WCDMA	-44.2, -49.2, -49.2, -49.2, -49.2, -49.2 | -32.2, -42.2, -42.2, -42.2, -42.2, -42.2

5G NR	-43.8, -43.8, -43.8, -43.8, -43.8, -43.8 | -29.2, -29.2, -29.2, -29.2, -29.2, -29.2
Radio Test	-60, -60, -60, 0, 0, 0

State Saved	Saved in instrument state
Min/Max	-150.0/50.0
Backwards Compatibility SCPI	`:CALCulate:MCPower:OFFSet:LIST:LIMit:NEGative[:UPPer]:DATA` (Power Suite, WCDMA)

Rel Limit (PSD)

Enters a relative limit value for the level of the power spectral density. This sets the amplitude levels to test against for any custom offsets. The amplitude level is relative to the power spectral density. If multiple offsets are available, the list contains 6 entries. The offset closest to the carrier channel is the first one in the list.

`[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe`.

The query returns the 6 sets of real numbers that are the current amplitude test limits, relative to the power spectral density, for each offset.

Offset[n] n = 1 is base station and n = 2 is mobiles. The default is base station (1).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:RPSDensity <rel_ampl>,…`
	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:RPSDensity?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS2:LIST:RPSD 10,10,10,10,10,10` `:ACP:OFFS2:LIST:RPSD?`
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
SA	-28.87 dB, -43.87 dB, 0 dB, 0 dB, 0 dB, 0 dB | -28.87 dB, -43.87 dB, 0 dB, 0 dB, 0 dB, 0 dB
WCDMA	-44.2 dB, -49.2 dB, -49.2 dB, -49.2 dB, -49.2 dB, -49.2 dB | -32.2 dB, -42.2 dB, -42.2 dB, -42.2 dB, -42.2 dB, -42.2 dB
LTEAFDD, LTEATDD, 5G NR, MSR	0, 0, 0, 0, 0, 0 | 0, 0, 0, 0, 0, 0
Radio Test	-60, -60, -60, 0, 0, 0

State Saved	Saved in instrument state
Min/Max	-150.0 dB/50.0 dB

Fail Mask

Accesses a menu that lets you select one of the logics for the fail conditions between the measurement results and the test limits. The setting defines the type of testing to be done at any custom offset frequencies. The measured powers are tested against the absolute values defined with `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:ABSolute`, or the relative values defined with [:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:RPSDensity and `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:RCARrier`.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe`.

Absolute	`ABSolute`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for **Abs Limit**
Relative	`RELative`	Fail is shown if one of the relative ACP measurement results is larger than the limit for **Rel Lim (Car)** or **Rel Lim (PSD)**
Abs AND Rel	`AND`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for **Abs Limit***and* one of the relative ACP measurement results is larger than the limit for **Rel Lim (Car)** or **Rel Lim (PSD)**
Abs OR Rel	`OR`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for **Abs Limit***or* one of the relative ACP measurement results is larger than the limit for **Rel Lim (Car)** or **Rel Lim (PSD)**

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:TEST ABSolute | AND | OR | RELative,…`
	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:TEST?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS2:LIST:TEST ABS,ABS,ABS,ABS,ABS,ABS` `:ACP:OFFS2:LIST:TEST?`
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
SA, WCDMA	`REL, REL, REL, REL, REL, REL | REL, REL, REL, REL, REL, REL`
LTEAFDD, LTEATDD, 5G NR, MSR	`AND, AND, AND, AND, AND, AND | AND, AND, AND, AND, AND, AND`

Modes	Values
Radio Test	`REL, REL, REL, REL, REL, REL`

State Saved	Saved in instrument state
Range	`ABSolute|AND|OR|RELative`
Backwards Compatibility SCPI	`[:SENSe]:MCPower:OFFSet[1]|2:LIST:TEST`

Inner Offset

Accesses a menu of functions that contains Offset, Offset Freq/Offset To Edge, Offset Integ BW, Upper Offset Limit and Lower Offset parameters.

Offset Frequency Define

Allows you to select “Offset” definition:

`CTOCenter`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the center frequency of each Offset Integ BW
`CTOEdge`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the closest edge frequency of each Offset Integ BW
`ETOCenter`	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the center frequency of each Offset Integ BW
`ETOEdge`	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the closest edge frequency of each Offset Integ BW
`STOCenter`	From either the lower or upper sub-block edge frequency to the center frequency of each Offset Integ BW
`STOEdge`	From either the lower or upper sub-block edge frequency to the closest edge frequency of each Offset Integ BW
`SCTOCenter` 5G NR Mode only	From the center frequency of sub-block** to the center frequency of each Offset Integ BW

** sub-block (bandwidth) = $BW_{channel,block}$ which is defined in each 3GPP standard, regardless of “Measure Carrier” for the uppermost and the lowermost carriers being Enabled or Disabled. When the Number of Component Carrier within each sub-block = 1, sub-block (bandwidth) = $BW_{channel} = 2 \times F_{offset,RAT}$.

See "Diagram for Offset Freq Define" on page 662

Mode: MSR, LTEAFDD, LTEATDD

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:TYPE CTOCenter | CTOEdge | ETOCenter | ETOEdge | STOCenter | STOEdge`
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:TYPE?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

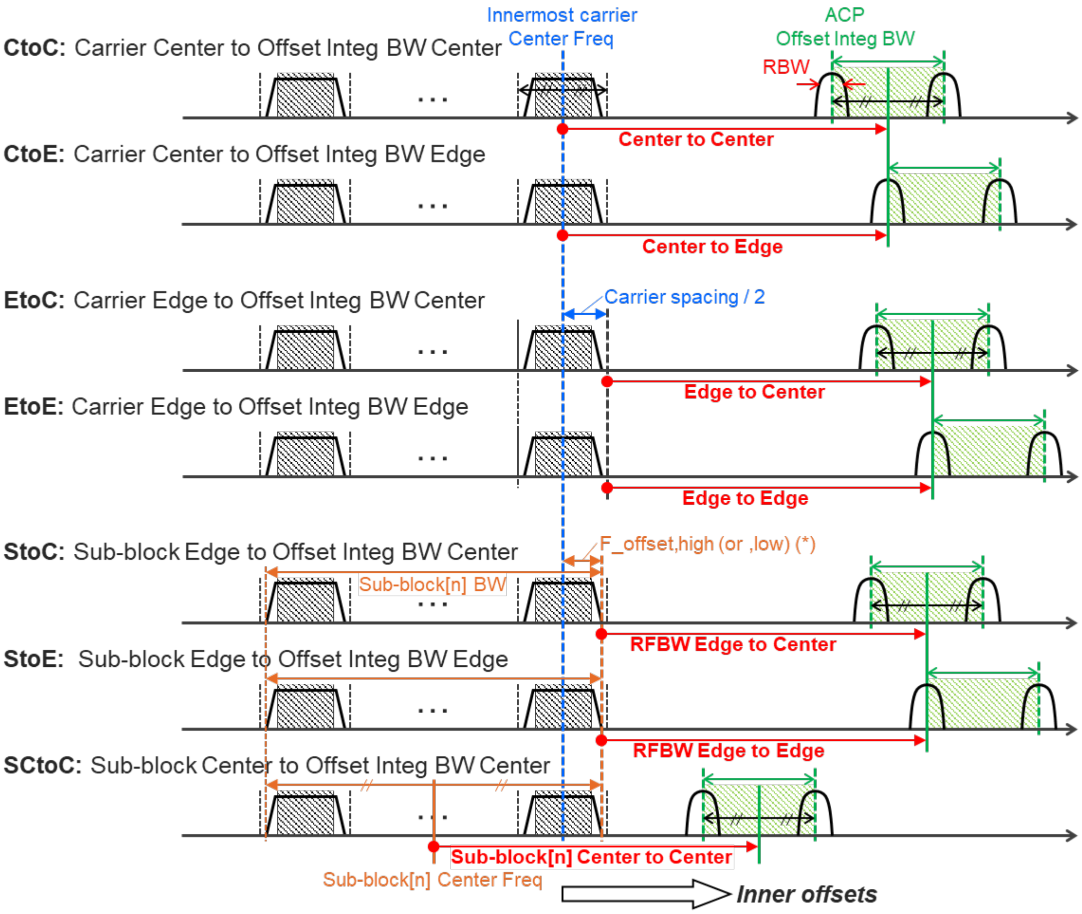
Example	`:ACP:OFFS:INN:TYPE ETOC` `:ACP:OFFS:INN:TYPE?`
Preset	`STOCenter`
State Saved	Saved in instrument state
Range	`CTOCenter|CTOEdge|ETOCenter|ETOEdge|STOCenter|STOEdge`

Mode: 5G NR

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:TYPE CTOCenter | CTOEdge | ETOCenter | ETOEdge | STOCenter | STOEdge | SCTOCenter`
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:TYPE?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS:INN:TYPE ETOC` `:ACP:OFFS:INN:TYPE?`
Preset	`STOCenter | CTOCenter`
State Saved	Saved in instrument state
Range	`CTOCenter | CTOEdge | ETOCenter | ETOEdge | STOCenter | STOEdge | SCTOCenter`

Diagram for Offset Freq Define



Note:

RF BW Edge and Outermost Carrier Edge are not always same.
e.g.) 5G NR (3GPP) defines BW_channel,CA which calculates F_offset,high and F_offset,low asymmetrically with SCS shift

(*) For MSR, F_offset,high (or ,low) = F_offset,RAT,high (or ,low)

Offset Freq

Determines the frequency difference between the center of the main channel and the center of the carrier. When set to Offset to Edge, this parameter determines the frequency difference between the center of the main channel and the near edge of the offset.

Each **Offset Freq** state value is entered individually by selecting the desired carrier. Use the **Enabled** checkbox to turn the **Offset Freq** State on or off.

The list contains up to 6 entries, depending on the mode selected, for offset frequencies. Each offset frequency in the list corresponds to a reference bandwidth in the bandwidth list.

An offset frequency of zero turns the display of the measurement for that offset off, but the measurement is still made and reported. You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe`.

Turning the offset off has the same effect as setting the frequency of the offset to 0 Hz, and causes it to be removed from the results screen.

<table>
<tr><td>Remote Command</td><td><code>[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST[:FREQuency] <freq>,…</code>

<tr><td>State Saved</td><td>Yes</td></tr>
</table>

Integ BW

Sets the Integration Bandwidth for the offsets. Each resolution bandwidth in the list corresponds to an offset frequency in the list defined by `[:SENSe]:ACP:OFFSet[n]:INNer:LIST[:FREQuency]`.

Enter each value individually by selecting the desired offset on the **Offset** menu key using the up down arrows, the knob, or the numeric keypad, then enter the Offset Integration Bandwidth using the **Offset Integration Bandwidth** menu key.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe`.

<table>
<tr><td>Remote Command</td><td><code>[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth[:INTegration] <freq>,…</code>

</table>

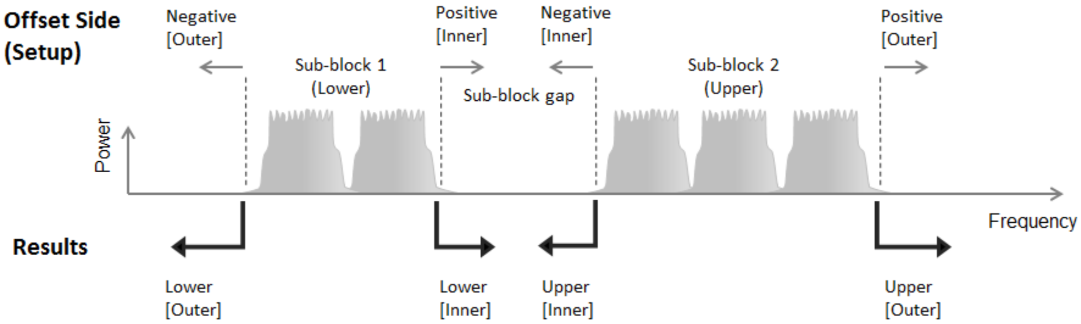
Offset Side

Lets you turn off (not use) specific offsets with `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:SIDE`.

- `NEGative` - The upper side in the sub-block gap only (that is, negative sideband of the upper sub-block) is enabled

- BOTH - Both sides in the sub-block gap are enabled
- POSitive - The lower side in the sub-block gap only (that is, positive sideband of the lower sub-block) is enabled

The diagram below shows the relation between the negative/positive offset side setups and the upper/lower results in the MSR, LTEAFDD and LTEATDD Modes.



Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:SIDE NEGative | BOTH | POSitive, …`
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:SIDE?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS:INN:LIST:SIDE BOTH` `:ACP:OFFS:INN:LIST:SIDE?`
Notes	If you set POS or NEG in an offset, result of the inactive side returns -999
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is BOTH `BOTH, BOTH, BOTH, BOTH, BOTH, BOTH | BOTH, BOTH, BOTH, BOTH, BOTH, BOTH`
State Saved	Saved in instrument state
Range	NEGative|BOTH|POSitive

Method

Lets you turn RRC filtering of each offset on or off. The value (roll off) for the filter is set to the value of the Filter Alpha parameter.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:FILTer[:RRC][:STATe] ON | OFF | 1 | 0,…`
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:FILTer[:RRC][:STATe]?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS:INN:LIST:FILT 1,0,0` `:ACP:OFFS:INN:LIST:FILT?`
Notes	1|ON = RRC Weighted, 0|OFF = Integ BW

Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
LTEAFDD	1,1,1,1,1,1 | 1,1,1,1,1,1
MSR, LTEATDD, 5G NR	0,0,0,0,0,0 | 0,0,0,0,0,0

State Saved	Saved in instrument state
Range	Integ BW | RRC Weighted

Filter Alpha

Sets the alpha value for the RRC Filter for each offset.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:FILTer:ALPHa <real>,…`
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:FILTer:ALPHa?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS:INN:LIST:FILT:ALPH 0.5,0.5,0.5,0.5,0.5,0.5` `:ACP:OFFS:INN:LIST:FILT:ALPH?`
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is 0.22 0.22,0.22,0.22,0.22,0.22,0.22|0.22,0.22,0.22,0.22,0.22,0.22
State Saved	Saved in instrument state
Min/Max	0.01/1.00

Advanced (Inner Offset)

Opens a further menu page that lets you set advanced properties of the Inner Offset, such as Res BW, Video BW, Filter and "Power Ref" on page 676 parameters.

Offset Freq

The same as "Offset Freq" on page 662 in the main **Inner Offset** menu.

Res BW

Sets the Resolution Bandwidth. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:RESolution <freq>,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:RESolution?`

	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink
Example	`:ACP:OFFS2:INN:LIST:BAND:RES 220kHz,220kHz,220kHz,220kHz,220kHz,220kHz` `:ACP:OFFS2:INN:LIST:BAND:RES?`
Dependencies	When "Meas Method" on page 582 is RBW, FAST or Fast Power, this control is grayed-out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent SCPI remote command is sent, a "Setting conflict" warning is generated
Couplings	When "Res BW" on page 553 Mode is **Auto**, this value is exactly the same as **Res BW**. When you change this value, **Res BW** Mode also changes to **Man**
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is 100 kHz 100 kHz, 100 kHz, 100k Hz, 100 kHz | 100 kHz,100 kHz, 100 kHz,100 kHz, 100 kHz, 100 kHz
State Saved	Saved in instrument state
Min/Max	1 Hz/8 MHz

Auto Function

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:RESolution:AUTO ON | OFF | 1 | 0,…`
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:RESolution:AUTO?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS2:INN:LIST:BAND:RES:AUTO 1,1,1,1,1,1` `:ACP:OFFS2:INN:LIST:BAND:RES:AUTO?`
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is 1 1, 1, 1, 1, 1, 1
State Saved	Yes

Video BW

Lets you change the instrument post-detection filter (VBW).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:VIDeo <freq>,…`
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:VIDeo?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS2:INN:LIST:BAND:VID 5MHz,5MHz,5MHz,5MHz,5MHz,5MHz` `:ACP:OFFS2:INN:LIST:BAND:VID?`
Notes	The values shown in this table reflect the conditions after **Mode Preset**
Dependencies	When "Meas Method" on page 582 is RBW, FAST or Fast Power, this cell is grayed-out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is 1 MHz 1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz

State Saved	Yes
Min/Max	1 Hz/50 MHz

Auto Function

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:VIDeo:AUTO OFF | ON | 0 | 1,…`
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:VIDeo:AUTO?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS2:INN:LIST:BAND:VID:AUTO 0,0,0,0,1,1` `:ACP:OFFS2:INN:LIST:BAND:VID:AUTO?`
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is `ON` `ON, ON, ON, ON, ON, ON`
State Saved	Yes

Filter Type

Selects the type of bandwidth filter that is used.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:SHAPe GAUSsian | FLATtop,…`
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:SHAPe?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS2:INN:LIST:BAND:SHAP FLAT,GAUS,GAUS,GAUS,GAUS,GAUS` `:ACP:OFFS2:INN:LIST:BAND:SHAP?`
Dependencies	When "Res BW" on page 553 Mode for the offset is **Auto**, this cell is grayed-out and disabled. Since **Res BW** Mode for the offset is preset to **Auto** on changing "Meas Method" on page 582 to RBW, FAST or Fast Power, this cell is grayed-out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is `GAUSsian` `GAUSsian, GAUSsian, GAUSsian, GAUSsian, GAUSsian, GAUSsian`
State Saved	Saved in instrument state
Range	`GAUSsian|FLATtop`

Filter BW

Selects a Gaussian filter based on its –3 dB (Normal) bandwidth or its –6 dB bandwidth.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:TYPE DB3 | DB6,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:TYPE?`

	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink
Example	`:ACP:OFFS2:INN:LIST:BAND:TYPE DB3,DB3,DB3,DB3,DB3,DB3` `:ACP:OFFS2:INN:LIST:BAND:TYPE?`
Dependencies	When "RBW Filter Type" on page 556 is `FLATtop` or "Res BW" on page 553 Mode for the offset is **Auto**, this cell is grayed-out and disabled. Since **Res BW** Mode for the offset is preset to **Auto** on changing "Meas Method" on page 582 to RBW, FAST or Fast Power, this cell is also grayed-out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is `DB3` `DB3, DB3, DB3, DB3, DB3, DB3`
State Saved	Saved in instrument state
Range	–3 dB (Normal) | –6 dB

Power Ref Type

Lets you set reference types of inner offsets.

`CUMulative`	Cumulated power of the upper and lower sub-block carriers is the reference level. This selection is effective only when one of the following "Power Ref" on page 676 values is selected:

Left & Right Carriers	`LRCarriers`
Max Power Carrier in Sub-block	`MPCSubblock`
Min Power Carrier in Sub-block	`MINSubbloc`
Left & Right Sub-blocks	`LRSubblocks`
Manual	`MANual`

When one of the other **Power Ref** values is selected, carrier powers are not cumulated, and the reference level is equivalent to Normal

`NORMal`	Power of specified carrier or the manual reference level is the reference level

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:PREFerence CUMulative | NORMal, …`
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:PREFerence?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS:INN:LIST:PREF CUM,CUM,NORM,NORM,NORM,NORM` `:ACP:OFFS:INN:LIST:PREF?`
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is `NORMal` `NORMal, NORMal, NORMal, NORMal, NORMal, NORMal`
State Saved	Saved in instrument state
Range	`CUMulative|NORMal`

Auto Function

<table>
<tr><td>Remote Command</td><td>`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:PREFerence:AUTO OFF | ON | 0 | 1, …`
`[:SENSe]:ACPower:OFFSet[1] | 2:INNer:LIST:PREFerence:AUTO?`
Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink</td></tr>
<tr><td>Example</td><td>`:ACP:OFFS:INN:LIST:PREF:AUTO OFF,OFF,OFF,OFF,OFF,OFF`

<tr><td>State Saved</td><td>Saved in instrument state</td></tr>
<tr><td>Range</td><td>`Auto|Man`</td></tr>
</table>

Inner Limits

Accesses a menu of functions that contains Select Offset, Abs Limit, Rel Limit and Fail Mask parameters.

Limit Test

This checkbox is the same as "Limit Test" on page 654 in the **Settings** tab.

Offset Freq

This column is the same as "Offset Freq" on page 662 in the **Offset** tab.

Abs Limit

Specifies an absolute limit value, which sets the absolute amplitude levels to test against for each of the custom offsets. The list must contain 6 entries. If there is more than one offset, the offset closest to the carrier channel is the first one in the list. `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe`.

The query returns the 6 sets of real numbers that are the current absolute amplitude test limits.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:ABSolute < real>,…`
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:ABSolute?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS2:INN:LIST:ABS -10,-10,-10,-10,-10,-10` `:ACP:OFFS2:INN:LIST:ABS?`
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
5G NR	-2.2, -2.2, -2.2, -2.2, -2.2, -2.2 | -50.0,-50.0,-50.0,-50.0,-50.0,-50.0
All Others	-8.45,-8.45,-8.45,-8.45,-8.45,-8.45 | -50.0,-50.0,-50.0,-50.0,-50.0,-50.0

State Saved	Saved in instrument state
Min/Max	-200.0 dBm/50.0 dBm

Rel Limit (Car)

Specifies a relative limit value for the carrier level. This sets the amplitude levels to test against for the specified offsets.

The amplitude level is relative to the carrier amplitude. If multiple offsets are available, the list contains 6 entries. The offset closest to the carrier channel is the first one in the list. `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe`.

The query returns the 6 sets of real numbers that are the current amplitude test limits, relative to the carrier, for each offset.

Offset[n] n = 1 is base station and n = 2 is mobiles. The default is base station (1).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:RCARrier <real>,…`
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:RCARrier?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS2:INN:LIST:RCAR 0,0,0,0,0,0` `:ACP:OFFS2:INN:LIST:RCAR?`
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is the same as the Offset F value
State Saved	Saved in instrument state
Min/Max	-150/50.0

Modes	Values
5G NR	-43.8, -43.8, 43.8, -43.8, -43.8, -43.8 | -29.2, -29.2, -29.2, -29.2, -29.2, -29.2
All Others	-44.2, -44.2,-44.2,-44.2,-44.2,-44.2 | -29.2, -29.2, -29.2, -29.2, -29.2, -29.2

Rel Limit (PSD)

Specifies a relative limit value for the level of the power spectral density. This sets the amplitude levels to test against for any custom offsets. The amplitude level is relative to the power spectral density. If multiple offsets are available, the list contains 6 entries. The offset closest to the carrier channel is the first one in the list.

`[:SENSe]:ACP:OFFSet[n]:INNer:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe`.

The query returns the 6 sets of real numbers that are the current amplitude test limits, relative to the power spectral density, for each offset.

Offset[n] n = 1 is base station and n = 2 is mobiles. The default is base station (1).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:RPSDensity <rel_ampl>,…`
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:RPSDensity?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:OFFS2:INN:LIST:RPSD 10,10,10,10,10,10` `:ACP:OFFS2:INN:LIST:RPSD?`
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is 0 0, 0, 0, 0, 0, 0 | 0, 0, 0, 0, 0, 0
State Saved	Saved in instrument state
Min/Max	-150.0 dB/50.0 dB

Fail Mask

Accesses a menu that enables you to select one of the logics for the fail conditions between the measurement results and the test limits. The setting defines the type of testing to be done at any custom offset frequencies. The measured powers are tested against the absolute values defined with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:ABSolute`, or the relative values defined with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:RPSDensity` and `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:RCARrier`.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe`.

Option	SCPI	Description
Absolute	`ABSolute`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for Abs Limit
Relative	`RELative`	Fail is shown if one of the relative ACP measurement results is larger than the limit for Rel Lim (Car) or Rel Lim (PSD)
Abs AND Rel	`AND`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for Abs Limit *and* one of the relative ACP measurement results is larger than the limit for Rel Lim (Car) or Rel Lim (PSD)
Abs OR Rel	`OR`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for Abs Limit *or* one of the relative ACP measurement results is larger than the limit for Rel Lim (Car) or Rel Lim (PSD)

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:TEST ABSolute | AND | OR | RELative,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:TEST?`

	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink
Example	`:ACP:OFFS2:INN:LIST:TEST ABS,ABS,ABS,ABS,ABS,ABS` `:ACP:OFFS2:INN:LIST:TEST?`
Preset	When "Max Num of Offsets" on page 633 is 12, the preset value of Offset G ~ L is `AND` `AND, AND, AND, AND, AND, AND | AND, AND, AND, AND, AND, AND`
State Saved	Saved in instrument state
Range	`ABSolute|AND|OR|RELative`

Reference Carrier (Carrier Index)

Sets the reference carrier. Relative power measurements are made from the reference carrier.

If set to **Auto**, the measurement selects the carrier with the highest power as the reference carrier and the Ref Carrier parameter is updated. If a value is entered when Ref Carrier Mode is set to **Auto**, the mode changes to **Man**.

If set to **Man**, the value that you enter for the Ref Carrier is used as the reference carrier.

In MSR, LTEAFDD, LTEATDD and 5G NR Modes, this control is called **Carrier Index** and has a different SCPI command. In these Modes, it sets the carrier index of the reference power. The power of the carrier selected by this index becomes reference power when "Power Ref" on page 676 is **Carrier Index**. Any value up to the MAX can be set, though the measurement only deals with number of carriers specified by Carrier. If the index is larger than Carrier, reference power in this measurement becomes `NaN` and therefore all relative power results are `NaN`.

For more information, see "Carrier Index (Modes: MSR, LTEAFDD, LTEATDD, and 5GNR)" on page 675.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:RCARrier <integer>`
	`[:SENSe]:ACPower:CARRier[1]|2:RCARrier?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:CARR:RCAR 1` `:ACP:CARR:RCAR?`
Notes	Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored For LTEAFDD and LTEATDD Modes, this control is not shown. In order to maintain backwards compatibility with legacy LTE FDD/TDD Modes, the SCPI command is supported in the LTE & LTE-A converged applications
Dependencies	Grayed-out if there is only one carrier Does not appear in MSR, LTEAFDD, LTEATDD and 5G NR Modes

Couplings	If you enter a carrier value that is currently configured as having no power present, that carrier changes to having power present
Preset	Auto determined
State Saved	Saved in instrument state
Min/Max	1/Number of available carriers
Backwards Compatibility SCPI	`[:SENSe]:MCPower:RCARrier[1]|2`

Auto Function

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:RCARrier:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:ACPower:CARRier[1]|2:RCARrier:AUTO?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:CARR:RCAR:AUTO OFF` `:ACP:CARR:RCAR:AUTO?`
Couplings	If you enter a ref carrier this parameter will be set to manual
Preset	1
State Saved	Yes
Range	Auto | Man
Backwards Compatibility SCPI	`[:SENSe]:MCPower:RCARrier[1]|2:AUTO` (Power Suite)

Carrier Index (Modes: MSR, LTEAFDD, LTEATDD, and 5GNR)

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:INDex <integer>`
	`[:SENSe]:ACPower:CARRier[1]|2:INDex?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:CARR:IND 1` `:ACP:CARR:IND?`
Notes	Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored
Dependencies	Only appears in MSR, LTEAFDD, LTEATDD and 5G NR Modes
Preset	1
State Saved	Saved in instrument state
Min/Max	LTEAFDD, LTEATDD: 1/Dependent on Num Component Carriers 5G NR: 1/Dependent on Num Component Carriers MSR: 1/100

Carrier Index Zero Base (Remote Command Only)

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:RCARrier:ZBASe <integer>`
	`[:SENSe]:ACPower:CARRier[1]|2:RCARrier:ZBASe?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:CARR:RCAR:ZBAS 1` `:ACP:CARR:RCAR:ZBAS?`
Notes	Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored
Dependencies	Not available in multicarrier applications (MSR, 5GNR, LTE Modes)
Couplings	Coupled with: `[:SENSe]:ACPower:CARRier[1]|2:RCARrier <integer>`
Preset	0
State Saved	Saved in instrument state
Min	0
Max	9

Measurement Type

Changes the reference used for the measurement. This allows you to make absolute and relative power measurements of either total power or the power normalized to the measurement bandwidth.

- Total Pwr Ref (`TPRef`) sets the reference to the total carrier power
- PSD Ref (`PSDRef`) sets the reference to the power spectral density of the carrier

Remote Command	`[:SENSe]:ACPower:TYPE TPRef | PSDRef` `[:SENSe]:ACPower:TYPE?`
Example	`:ACP:TYPE PSDR` `:ACP:TYPE?`
Preset	`TPRef`
State Saved	Saved in instrument state
Range	Total Power Ref | PSD Ref

Power Ref

Selects the power reference type. This control has two different forms, depending on the currently-selected Mode:

- "Power Ref (Modes: SA, WCDMA, VMA, SRComms)" on page 677
- "Power Ref (Modes: LTEAFDD, LTEATDD, 5G NR, MSR)" on page 677

Power Ref (Modes: SA, WCDMA, VMA, SRComms)

Type	Option	Description
Ref Carrier	`RCARrier`	Power of the specified carrier is the reference of measurement. Use the Reference Carrier control to select Carrier Index
Manual Power	`MANual`	Power or PSD specified by the user is the reference of measurement
Total Multicarriers	`TMCarriers`	Total Power of multi carriers is the power reference of measurement. Each carrier power is calculated with its own carrier configuration settings

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:PREFerence:TYPE RCARrier | MANual | TMCarriers`
	`[:SENSe]:ACPower:CARRier[1]|2:PREFerence:TYPE?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:CARR:PREF:TYPE RCARrier` `:ACP:CARR:PREF:TYPE?`
Notes	Available only in SA, WCDMA, VMA and Short-Range Comms Modes Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored
Preset	`RCARrier`
State Saved	Saved in instrument state
Range	`RCARrier|MANual|TMCarriers`

Power Ref (Modes: LTEAFDD, LTEATDD, 5G NR, MSR)

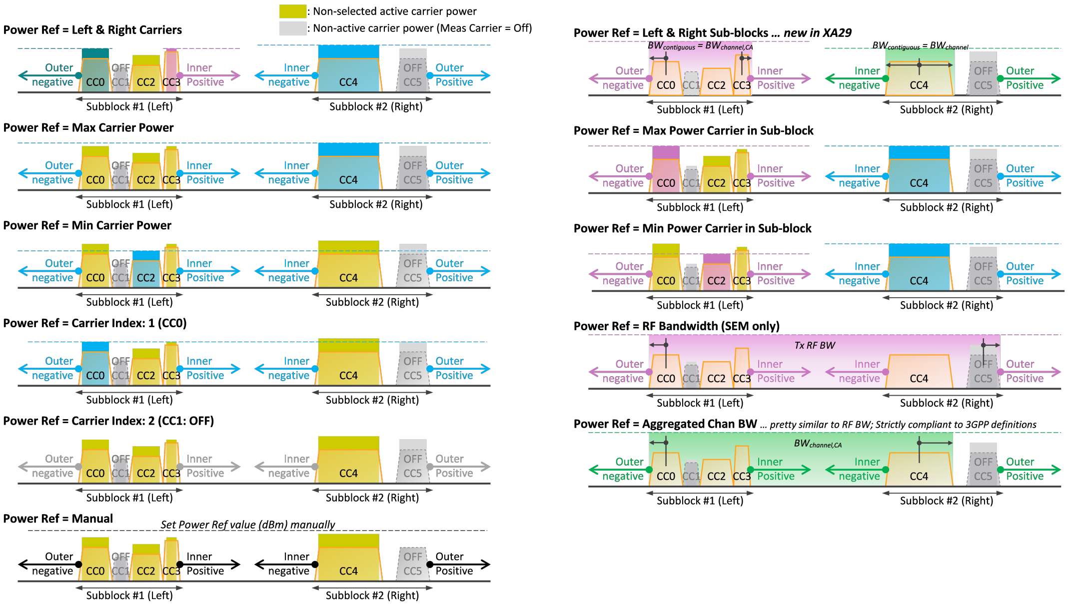
Selects the power reference type:

Type	Option	Description
Left & Right Carriers	`LRCarriers`	Powers of leftmost and rightmost carriers with Measure Carrier On in a sub-block are the references of left and right sides respectively. Left and right carriers are determined based on the carrier center frequencies. If Measure Carriers of all the carriers in a sub-block are off, the reference power in a sub-block and all the relative power results are NaN. Relative limits are not evaluated
Max Power Carrier	`MPCarrier`	Maximum carrier power among the carriers of Measure Carrier On is the reference of measurement. If Measure Carriers of all the carriers are off, the reference power and all the relative power results are NAN. Relative limits are not evaluated
Min Power	`MINPcarrier`	Minimum carrier power among the carriers of Measure Carrier On is the

Type	Option	Description
Carrier 5G NR only		reference of measurement. If Measure Carriers of all the carriers are off, the reference power and all the relative power results are NAN. Relative limits are not evaluated
Carrier Index	`CINDex`	Power of the specified carrier is the reference of measurement. If Measure Carriers of this carrier index is off, the reference power and all the relative power results are NAN. Relative limits are not evaluated
Manual	`MANual`	Power or PSD specified by the user is the reference of measurement
Aggregated Chan BW LTEAFDD, LTEATDD, 5G NR only	`ACBandwidth`	The assigned aggregated channel bandwidth power which is measured with a rectangular filter with measurement bandwidth specified as aggregated channel bandwidth based on the definition of each 3GPP standard. Calculated from the carrier configuration including SCS (Power Meas), the smallest SCS among the enabled SCSs of the selected component carrier. If Measure Carriers of all the carriers are off, the reference power and all the relative power results are NAN. Relative limits are not evaluated
Max Power Carrier in Sub-block	`MPCSubblock`	Maximum carrier power among the sub-block carriers of Measure Carrier On is the reference of measurement. If Measure Carriers of all the carriers in a sub-block are off, the reference power of the sub-block and all the relative power results referring to this sub-block are NAN, and these relative limits are not evaluated
Total Multicarriers MSR only	`TMCarriers`	Total power of multi carriers is the power reference of measurement. Each carrier power is calculated with its own carrier configuration settings
Min Power Carrier in Sub-block 5G NR only	`MINSubbloc`	Minimum carrier power among the sub-block carriers of Measure Carrier On is the reference of measurement. If Measure Carriers of all the carriers in a sub-block are off, the reference power of the sub-block and all the relative power results referring to this sub-block are NAN, and these relative limits are not evaluated
Left & Right Sub-blocks 5G NR only	`LRSubblocks`	The reference depends on the number of Component Carriers (CC) and Carrier Allocation as follows: – Num of CC is 1: the carrier power is the reference – Num of CC is 2 or more & Carrier Allocation is Contiguous: Aggregated Channel power is the reference – Num of CC is 2 or more & Carrier Allocation is Non-Contiguous: Aggregated powers of left and right sub-blocks are the references. Left and right sub-blocks are determined by component carrier configuration

The powers of carriers are not included in the reference power when their Measure Carriers are Off. When Measure Carriers of all the carriers in a sub-block are Off, the reference power and all the relative power results are `NaN`. Therefore, relative limits are not evaluated.

Measurement Type = Total Power Ref



Power Ref = Left & Right Carriers

Power Ref = Max Carrier Power

Power Ref = Min Carrier Power

Power Ref = Carrier Index: 1 (CC0)

Power Ref = Carrier Index: 2 (CC1: OFF)

Power Ref = Manual

Set Power Ref value (dBm) manually

Power Ref = Left & Right Sub-blocks ... new in XA29

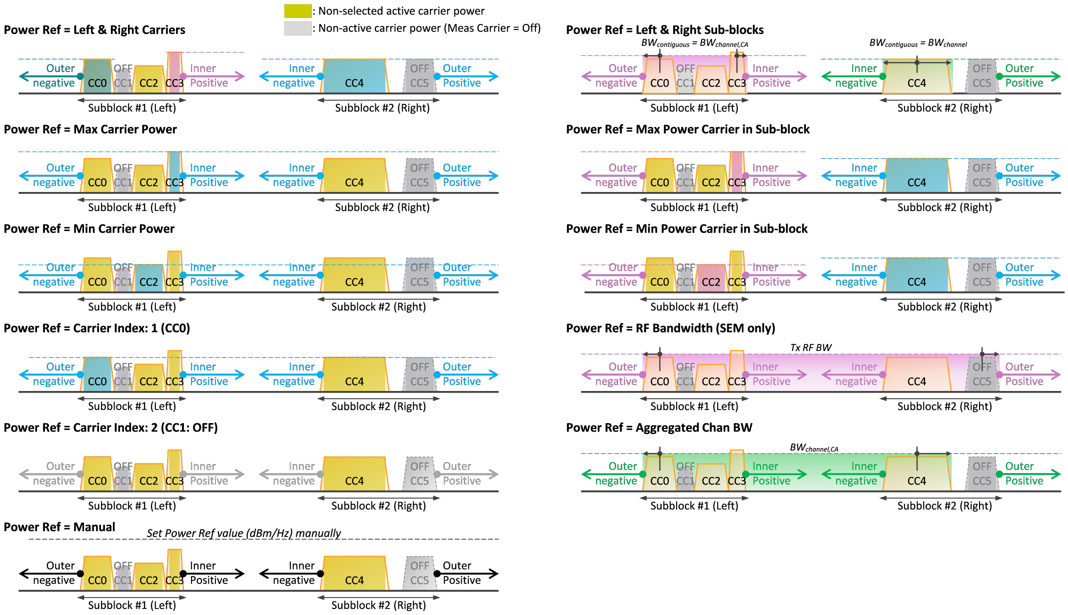
Power Ref = Max Power Carrier in Sub-block

Power Ref = Min Power Carrier in Sub-block

Power Ref = RF Bandwidth (SEM only)

Power Ref = Aggregated Chan BW ... pretty similar to RF BW; Strictly compliant to 3GPP definitions

Measurement Type = PSD Ref



Power Ref = Left & Right Carriers

Power Ref = Max Carrier Power

Power Ref = Min Carrier Power

Power Ref = Carrier Index: 1 (CC0)

Power Ref = Carrier Index: 2 (CC1: OFF)

Power Ref = Manual

Set Power Ref value (dBm/Hz) manually

Power Ref = Left & Right Sub-blocks

Power Ref = Max Power Carrier in Sub-block

Power Ref = Min Power Carrier in Sub-block

Power Ref = RF Bandwidth (SEM only)

Power Ref = Aggregated Chan BW

Remote	`[:SENSe]:ACPower:CARRier[1]|2:PREFerence:TYPE LRCarriers	MPCarrier	CINDex`

Command	`| MANual | MPCSubblock | ACBandwidth | TMCarriers | MINPcarrier | MINSubblock | LRSubblocks`
	`[:SENSe]:ACPower:CARRier[1]|2:PREFerence:TYPE?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:CARR:PREF:TYPE CIND` `:ACP:CARR:PREF:TYPE?`
Notes	Available only in MSR, LTEAFDD, LTEATDD and 5G NR Modes `ACBandwidth` is available only in LTEAFDD, LTEATDD and 5G NR Modes `TMCarriers` is available only in MSR Mode `MINPcarrier,MINSubblock`, and `LRSubblocks` are available only in 5G NR Mode Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored
Preset	`MPCarrier`
State Saved	Saved in instrument state

Power Ref State (Remote Command Only)

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:AUTO[:STATe] OFF | ON | 0 | 1`
	`[:SENSe]:ACPower:CARRier[1]|2:AUTO[:STATe]?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:CARR:AUTO OFF` `:ACP:CARR:AUTO?`
Preset	`ON`
State Saved	Saved in instrument state
Range	Auto | Man
Backwards Compatibility SCPI	`[:SENSe]:MCPower:CARRier[1]|2:AUTO[:STATe]`

Total Power Ref

Sets manual total power reference.

This control has two different forms, depending on the currently-selected Mode:

- "Total Power Ref (Modes: SA, WCDMA, VMA, SRComms)" on page 681
- "Total Power Ref (Modes: LTEAFDD, LTEATDD, 5G NR, MSR)" on page 681

Total Power Ref (Modes: SA, WCDMA, VMA, SRComms)

This is used when Power Ref is Manual and "Measurement Type" on page 676 is Total Power.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2[:POWer] <real>`
	`[:SENSe]:ACPower:CARRier[1]|2[:POWer]?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:CARR 10` `:ACP:CARR?`
Notes	Although the default value is defined, the value is recalculated by the measurement result just after measurement Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored The Unit Terminators differ depending on whether or not the mode supports Y Axis Unit and also which Y Axis Unit is selected
Dependencies	Available only when **Measurement Type** is `TPRef`, otherwise grayed-out
Preset	0.0
State Saved	Saved in instrument state
Min/Max	-200 dBm/200 dBm
Backwards Compatibility SCPI	`[:SENSe]:MCPower:CARRier[1]|2[:POWer]`

Total Power Ref (Modes: LTEAFDD, LTEATDD, 5G NR, MSR)

Sets the multi-carrier power reference. This is used when Power Ref is Manual and "Measurement Type" on page 676 is Total Power.

When set to **Auto**, the carrier power result reflects the measured power value in the selected reference carrier.

When set to **Man**, the result is referenced to the last measured value, or you may specify the reference for the multi-carrier power measurement. Relative values are displayed, referenced to the “Power Reference” value.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2[:POWer] <real>`
	`[:SENSe]:ACPower:CARRier[1]|2[:POWer]?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:CARR 10` `:ACP:CARR?`

Notes	Although the default value is defined, the value is recalculated by the measurement result just after measurement Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored The Unit Terminators differ depending on whether or not the mode supports Y Axis Unit and also which Y Axis Unit is selected
Dependencies	Enabled when "Measurement Type" on page 676 is Total Power and "Power Ref" on page 676 is Manual
Preset	0.0
State Saved	Saved in instrument state
Min/Max	-200 dBm/200 dBm
Backwards Compatibility SCPI	`[:SENSe]:MCPower:CARRier[1]|2[:POWer]`

PSD Ref

Sets manual PSD reference.

This control has two different forms, depending on the currently-selected Mode:

- "PSD Ref (Modes: SA, WCDMA, VMA, SRComms)" on page 682
- "PSD Ref (Modes: LTEAFDD, LTEATDD, 5GNR, MSR)" on page 683

PSD Ref (Modes: SA, WCDMA, VMA, SRComms)

This is used when "Power Ref" on page 676 is Manual and "Measurement Type" on page 676 is PSD.

Sets the power spectral density in the carrier (main channel) that is used to compute the relative power spectral density values for the offsets when **Measurement Type** is PSD Ref.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:CPSD <real>`
	`[:SENSe]:ACPower:CARRier[1]|2:CPSD?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:CARR:CPSD 25` `:ACP:CARR:CPSD?`
Notes	Although the default value is defined, the value is recalculated by the measurement result just after measurement Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored

Dependencies	Available only when Measurement Type is `PSDRef`, otherwise grayed-out
Couplings	The value of PSD Ref is automatically converted when PSD Unit is changed
Preset	0.0
State Saved	Saved in instrument state
Min/Max	-999/999

Power Ref State (Backwards Compatibility SCPI)

Sets the Power Reference State to auto or manual.

Example	`:ACP:CARR:AUTO OFF`
	`:ACP:CARR:AUTO?`
	`:MCP:CARR:AUTO ON`
	`:MCP:CARR:AUTO?`

Notes	For backwards compatibility with legacy SA and WCDMA, this command is supported When `ON`, corresponds to the Ref Carrier of the "Power Ref" on page 676 selection When `OFF`, corresponds to the Manual of the **Power Ref** selection
Preset	`ON`
State Saved	Saved in instrument state
Range	`Auto|Man`

Backwards Compatibility SCPI	`[:SENSe]:ACPower:CARRier[1]|2:AUTO[:STATe] OFF | ON | 0 | 1`
	`[:SENSe]:ACPower:CARRier[1]|2:AUTO[:STATe]?`
	`[:SENSe]:MCPower:CARRier[1]|2:AUTO[:STATe] OFF | ON | 0 | 1`
	`[:SENSe]:MCPower:CARRier[1]|2:AUTO[:STATe]?`

PSD Ref (Modes: LTEAFDD, LTEATDD, 5GNR, MSR)

Sets manual PSD reference. This is used when "Power Ref" on page 676 is **Manual** and "Measurement Type" on page 676 is **PSD**.

Sets the power spectral density in the carrier (main channel) that is used to compute the relative power spectral density values for the offsets when **Measurement Type** is set to **PSD Ref**. When the **PSD Ref** state is set to **Auto**, this will be set to the measured carrier power spectral density.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:CPSD <real>`
	`[:SENSe]:ACPower:CARRier[1]|2:CPSD?`
	Subopcode: 1 = BTS/Downlink (Default), 2 = MS/Uplink

Example	`:ACP:CARR:CPSD 25`

	`:ACP:CARR:CPSD?`
Notes	Although the default value is defined, the value is recalculated by the measurement result just after measurement Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored
Dependencies	Enabled when "Measurement Type" on page 676 is PSD Reference and **Power Ref** is Manual
Couplings	The value of PSD is automatically converted when PSD Unit is changed
Preset	0.0
State Saved	Saved in instrument state
Min/Max	–/+999

PSD Unit

Sets the unit bandwidth for Power Spectral Density. The available units are dBm/Hz (`DBMHZ`) and dBm/MHz (`DBMMHZ`).

Remote Command	`:UNIT:ACPower:POWer:PSD DBMHZ | DBMMHZ` `:UNIT:ACPower:POWer:PSD?`
Example	`:UNIT:ACP:POW:PSD DBMMHZ` `:UNIT:ACP:POW:PSD?`
Dependencies	Enabled when "Measurement Type" on page 676 is PSD Reference
Couplings	When the PSD unit is changed, the PSD reference result of `:MEAS|READ|FETCH:ACP[n]?` is also changed by the PSD unit basis (in either dBm/Hz or dBm/MHz)
Preset	`DBMHZ`
State Saved	Saved in instrument state
Range	dBm/Hz | dBm/MHz

3.4.13.3 Radio

Contains controls to select link direction.

Direction

Specifies whether the LTE-Advanced signal is an uplink signal or a downlink signal.

The choice of link direction determines the Sync/Format, Chan Profile and Time. Advanced menus all change based on the link direction selected. Also, since downlink and uplink signals use OFDMA and SC-FDMA respectively, the list of trace results available and the default traces presented change based on the link direction parameter.

Remote Command	`[:SENSe]:RADio:STANdard:DIRection DLINk | ULINk` `[:SENSe]:RADio:STANdard:DIRection?`
Example	`:RAD:STAN:DIR DLIN`
Couplings	TDD: Changing direction affects the sync source of periodic trigger source or gate source If Direction is uplink, the sync source is RF burst If Direction is downlink, the sync source is External1 If direction is downlink, the menu Measure PRACH/SRS is disabled and the value is off FDD/TDD: Changing Direction affects many other modulation analysis setup parameters
Preset	DLIN ULIN on E6640A DLIN on E6650A
State Saved	Yes
Range	Downlink|Uplink For E6640A, Direction is restricted to Uplink only, Downlink is not selectable For E6650A, Direction is restricted to Downlink only, Uplink is not selectable

eMTC Analysis

Enable/Disables the eMTC analysis function.

Remote Command	`[:SENSe]:RADio:STANdard:EMTC[:STATe] ON | OFF | 1 | 0` `[:SENSe]:RADio:STANdard:EMTC[:STATe]?`
Example	`:RAD:EMTC:STAT OFF`
Dependencies	This parameter requires N9080EM3E license
Preset	OFF
Backwards Compatibility SCPI	`[:SENSe]:RADio:EMTC[:STATe]`

Interfering Signal Present

Sets whether interfering signal for the intermodulation tests exists or not. If exists, limits are not evaluated over the interference signal frequency range specified by the span and the center frequency parameters in ACP, SEM and Spurious Emissions.

Remote Command	`[:SENSe]:RADio:IMODulation:INTerference[:STATe] OFF | ON | 0 | 1` `[:SENSe]:RADio:IMODulation:INTerference[:STATe]?`
Example	`:RAD:IMOD:INT 1` `:RAD:IMOD:INT?`
Preset	OFF

State Saved	Saved in instrument state
Range	Yes|No

Freq Offset from Edge

Sets the center frequency of the interference signal for intermodulation tests. The frequency is set as offset frequency from the BS RF bandwidth edge. Interference Offset Side determines on which side of the BS RF bandwidth the interference signal exists.

Remote Command	`[:SENSe]:RADio:IMODulation:INTerference:FREQuency:OFFSet <freq>` `[:SENSe]:RADio:IMODulation:INTerference:FREQuency:OFFSet?`
Example	`:RAD:IMOD:INT:FREQ:OFFS 5MHz` `:RAD:IMOD:INT:FREQ:OFFS?`
Preset	5MHz
State Saved	Saved in instrument state
Min/Max	0 Hz / 20.0 MHz

Span

Sets the span of the interference signal for intermodulation tests.

Remote Command	`[:SENSe]:RADio:IMODulation:INTerference:SPAN <freq>` `[:SENSe]:RADio:IMODulation:INTerference:SPAN?`
Example	`:RAD:IMOD:INT:SPAN 5MHz` `:RAD:IMOD:INT:SPAN?`
Preset	5 MHz
State Saved	Saved in instrument state
Min/Max	200 kHz / 20.0 MHz

Offset Side

Sets which side of the BS RF bandwidth the interference signal exists on.

Remote Command	`[:SENSe]:RADio:IMODulation:INTerference:SIDE NEGative | POSitive` `[:SENSe]:RADio:IMODulation:INTerference:SIDE?`
Example	`:RAD:IMOD:INT:SIDE POS` `:RAD:IMOD:INT:SIDE?`
Preset	POSitive
State Saved	Saved in instrument state

Non-Contiguous Interference Region

Sets the region the interfering signal exists at in the Non-Contiguous mode:

- INNer – The interfering signal exists at the inner region. This setting is only effective when Carrier Alloc is Non-Contiguous. When in Contiguous, the interference region is always outside regardless of the selection of this parameter
- OUTer – The interfering signal exists at either of the outer regions

Remote Command	`[:SENSe]:RADio:IMODulation:INTerference:REGion INNer | OUTer` `[:SENSe]:RADio:IMODulation:INTerference:REGion?`
Example	`:RAD:IMOD:INT:REG OUT` `:RAD:IMOD:INT:REG?`
Preset	OUTer
State Saved	Saved in instrument state

3.4.13.4 Component Carriers

Contains settings that let you configure the analyzer to match the component carriers in your LTE-A signal.

Number of Component Carriers

Specifies how many component carriers are included in LTE-Advanced TDD/FDD measurements. Each component carrier complies with the LTE specifications.

LTE-Advanced TDD/FDD supports a maximum of five component carriers, so the maximum transmission bandwidth is up to 100 MHz.

Remote Command	`[:SENSe]:CCARrier:COUNt <integer>` `[:SENSe]:CCARrier:COUNt?`
Example	`:CCAR:COUN 1` `:CCAR:COUN?`
Notes	The max number of Component carriers can be set greater than one with 9080B/9082B-2FP license
Preset	1
State Saved	Yes
Min	1
Max	5

Carrier Allocation

Specifies the carrier frequency allocation. There are two types of allocation, contiguous and non-contiguous. Non-Contiguous frequency allocation is defined as an allocation where two sub-blocks are separated with a sub-block gap:

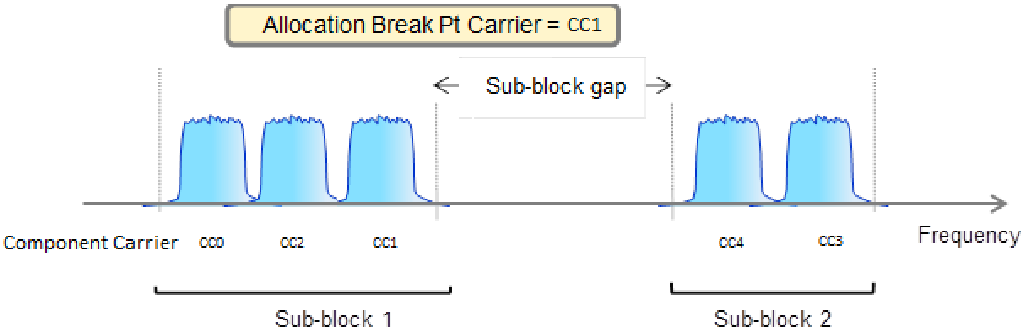
- CONTiguous – All the component carriers belong to one block and no sub-block gap exists
- NCONtiguous – Component carriers are separated into two sub-blocks. Allocation Break Pt Carrier determines how sub-blocks are configured

Remote Command	`[:SENSe]:CCARrier:CONFig:ALLocation CONTiguous | NCONtiguous` `[:SENSe]:CCARrier:CONFig:ALLocation?`
Example	`:CCAR:CONF:ALL CONT` `:CCAR:CONF:ALL?`
Preset	CONTiguous
State Saved	Saved in instrument state
Range	Contiguous|Non-Contiguous

Non-Contiguous Break at

Specifies an allocation break point in non-contiguous carrier allocation. First sub-block starts from the lowest frequency carrier and stops at the allocation break point carrier. Next sub-block starts from the next upper frequency carrier and ends at the highest frequency carrier.

one example is shown below. In the example carrier indices are not in the order of carrier frequency. In the example, Allocation Break Pt Carrier is CC1. It means that sub-block 1 ends at carrier CC1 and sub-block 2 starts at carrier CC4. Sub-block gap is located between carrier CC1 and CC4.



Remote Command	`[:SENSe]:CCARrier:CONFig:ALLocation:NCONtiguous:ABPoint CC0 | … | CC4`

	`[:SENSe]:CCARrier:CONFig:ALLocation:NCONtiguous:ABPoint?`
Example	`:CCAR:CONF:ALL:NCON:ABP CC0` `:CCAR:CONF:ALL:NCON:ABP?`
Notes	The options CC1~CC4 can be enabled with 9080B/9082B-2FP license
Dependencies	Allocation Break Point is coupled to Number of Component Carriers. For example, Allocation Break Point list will include CC0~CC1 if the number of Component Carriers is 2
Preset	CC0
State Saved	Saved in instrument state
Range	CC0|CC1|CC2|CC3|CC4

Configure Comp Carriers

Lets you perform a detailed configuration of your component carriers, including number of carriers, presets, bandwidth, offset, integration bandwidth, etc.

Configure CCs

Lets you configure System Bandwidth, frequency offsets, and integration bandwidth, and also lets you exclude certain carriers from the measurement.

Number of Component Carriers

See "Number of Component Carriers" on page 2245.

Carrier Allocation

See "Carrier Allocation" on page 2245.

Non-Contiguous Break at

See "Non-Contiguous Break at" on page 2246.

System BW

Enables you to set the system bandwidth of each component carrier for LTE-Advanced / NB-IoT signal (which also determines the total number of resource blocks for Modulation Analysis measurement).

Remote Command	`[:SENSe]:CCARrier0|…|4:RADio:STANdard:BANDwidth B1M4 | B3M | B5M | B10M | B15M | B20M | B200K`

	`[:SENSe]:CCARrier0|…|4:RADio:STANdard:BANDwidth?`
Example	`:CCAR4:RAD:STAN:BAND B5M`
Preset	B5M
State Saved	Yes
Range	1.4 MHz (6 RB) | 3 MHz (15 RB) | 5 MHz (25 RB) | 10 MHz (50 RB) | 15 MHz (75 RB) | 20 MHz (100 RB) | 200kHz (NB-IoT)
Backwards Compatibility SCPI	`[:SENSe]:RADio:STANdard:BANDwidth`

Measure Carrier

Sets whether to measure this component carrier or not.

Remote Command	`[:SENSe]:CCARrier0|…|4[:STATe] OFF | ON | 0 | 1` `[:SENSe]:CCARrier0|…|4[:STATe]?`
Example	`:CCAR0 ON` `:CCAR0?`
Notes	The command is used with a sub-op code <n> (default=0) to specify the component carrier for configuration. The range of the sub-op code is determined by the number of component carriers
Preset	ON
State Saved	Saved in instrument state
Range	On|Off

Frequency Offset

Sets the component carrier center frequency as offset from the Carrier Ref Frequency.

Remote Command	`[:SENSe]:CCARrier<n>:FREQuency:OFFSet <freq>` `[:SENSe]:CCARrier<n>:FREQuency:OFFSet?`
Example	`:CCAR4:FREQ:OFFS 10MHz` `:CCAR4:FREQ:OFFS?`
Notes	Used with a sub-op code <n> (default=0) to specify the component carrier for configuration. The range of the sub-op code is determined by the number of component carriers
Preset	0Hz
State Saved	Saved in instrument state
Min	-3.5GHz
Max	3.5GHz

Spectrum

Determines if the spectrum of the incoming data is mirrored or not. The actual mirroring is accomplished by conjugating the complex time data.

Note that only the Modulation Analysis measurement and Conformance EVM measurement support this feature.

Remote Command	`[:SENSe]:CCARrier0|…|4:SPECtrum NORMal | INVert` `[:SENSe]:CCARrier0|…|4:SPECtrum?`
Example	`:CCAR0:SPEC INV` `:CCAR0:SPEC?`
Preset	NORM
State Saved	Yes
Range	Normal | Invert
Backwards Compatibility SCPI	`[:SENSe]:SPECtrum`

UL/DL Configuration

Allows you to set the Uplink and Downlink allocation configuration of the signal being measured. The choice of link direction will determine which slot in the frame is used for uplink transmission, and which slot for downlink transmission.

Remote Command	`[:SENSe]:CCARrier0|…|4:RADio:STANdard:ULDL CONF0 | … | CONF6` `[:SENSe]:CCARrier0|…|4:RADio:STANdard:ULDL?`
Example	`:CCAR0:RAD:STAN:ULDL CONF0`
Notes	CONF0: Configuration 0 (DSUUUDSUUU) CONF1: Configuration 1 (DSUUDDSUUD) CONF2: Configuration 2 (DSUDDDSUDD) CONF3: Configuration 3 (DSUUUDDDDD) CONF4: Configuration 4 (DSUUDDDDDD) CONF5: Configuration 5 (DSUDDDDDDD) CONF6: Configuration 6 (DSUUUDSUUD)
Preset	CONF0
State Saved	Yes
Range	Configuration 0|Configuration 1|Configuration 2|Configuration 3|Configuration 4|Configuration 5|Configuration 6
Backwards Compatibility SCPI	`[:SENSe]:RADio:STANdard:ULDL`

Dw/GP/Up Len

This control allows you to set the DwPTS/GP/UpPTS length configuration of the signal being measured. The choice of link direction will determine the length of DwPTS, GP and UpPTS in the Special Subframe.

Remote Command	`[:SENSe]:CCARrier0|…|4:RADio:STANdard:DGPU CONF0 | … | CONF9` `[:SENSe]:CCARrier0|…|4:RADio:STANdard:DGPU?`
Example	`:CCAR0:RAD:STAN:DGPU CONF0`
Notes	CONF0: Configuration 0 CONF1: Configuration 1 CONF2: Configuration 2 CONF3: Configuration 3 CONF4: Configuration 4 CONF5: Configuration 5 CONF6: Configuration 6 CONF7: Configuration 7 CONF8: Configuration 8 CONF9: Configuration 9
Dependencies	The special sub-frame configuration 9 is only enabled when it is LTE-Advanced TDD
Preset	CONF0
State Saved	Yes
Range	Configuration 0|Configuration 1|Configuration 2|Configuration 3|Configuration 4|Configuration 5|Configuration 6|Configuration 7|Configuration 8|Configuration 9
Backwards Compatibility SCPI	`[:SENSe]:RADio:STANdard:DGPU`

CHP Power Integ BW

Specifies the range of integration used in calculating the power in the component carrier s in the CHP measurement.

Remote Command	`[:SENSe]:CCARrier0|…|4:CHPower:BANDwidth:INTegration <freq>` `[:SENSe]:CCARrier0|…|4:CHPower:BANDwidth:INTegration?`
Example	`:CCAR0:CHP:BAND:INT 20MHz` `:CCAR0:CHP:BAND:INT?`
Notes	You must be in LTEATDD/LTEAFDD Mode to use this command. Use :INSTrument:SELect to set the mode
Couplings	When System Bandwidth of the parameter set is changed, the value of this parameter also changes as shown in the following table.

	<table><tr><th>System Bandwidth</th><th>CHP Integ BW</th></tr><tr><td>1.4 MHz (B1M4)</td><td>1.4 MHz</td></tr><tr><td>3 MHz (B3M)</td><td>3 MHz</td></tr><tr><td>5 MHz (B5M)</td><td>5 MHz</td></tr><tr><td>10 MHz (B10M)</td><td>10 MHz</td></tr><tr><td>15 MHz (B15M)</td><td>15 MHz</td></tr><tr><td>20 MHz (B20M)</td><td>20 MHz</td></tr><tr><td>200 kHz(B200K)</td><td>200 kHz</td></tr></table>
Preset	5 MHz
State Saved	Saved in instrument state
Min	100 kHz
Max	20 MHz
Backwards Compatibility SCPI	`[:SENSe]:CHPower:BANDwidth:INTegration` `[:SENSe]:CHPower:BWIDth:INTegration`

ACP Power Integ BW

Specifies the Measurement Noise Bandwidth used to calculate the power in the component carriers in the ACP measurement.

Remote Command	`[:SENSe]:CCARrier0|…|4:ACPower:BANDwidth[1]|2:INTegration <freq>` `[:SENSe]:CCARrier0|…|4:ACPower:BANDwidth[1]|2:INTegration?`
Example	`:CCAR0:ACP:BAND:INT 20MHz` `:CCAR0:ACP:BAND:INT?`
Notes	Carrier sub op code, 1 is for BTS, 2 for MS. Default is BTS You must be in the LTEATDD/LTEAFDD mode. Use :INSTrument:SELect to set the mode
Couplings	When System Bandwidth of the parameter set is changed, the value of this parameter also changes as shown in the following table.

System Bandwidth	BTS ACP Meas Noise BW	MS ACP Meas Noise BW
1.4 MHz (B1M4)	1.095 MHz	1.08 MHz
3 MHz (B3M)	2.715 MHz	2.7 MHz
5 MHz (B5M)	4.515 MHz	4.5 MHz
10 MHz (B10M)	9.015 MHz	9.0 MHz
15 MHz (B15M)	13.515 MHz	13.5 MHz
20 MHz (B20M)	18.015 MHz	18.0 MHz
200 kHz(B200K)	180 kHz	180 kHz

Preset	4.515 MHz|4.5 MHz
State Saved	Yes
Min	100 kHz
Max	20 MHz
Backwards Compatibility SCPI	`[:SENSe]:ACPower:CARRier[1]|2:LIST:BANDwidth[:INTegration]` `[:SENSe]:ACPower:CARRier[1]|2:LIST:BWIDth[:INTegration]`

SEM Power Integ BW

Specifies the integration bandwidth used to calculate the power in the component carriers in SEM measurement.

Remote Command	`[:SENSe]:CCARrier0|…|4:SEMask:BANDwidth[1]|2:INTegration <freq>` `[:SENSe]:CCARrier0|…|4:SEMask:BANDwidth[1]|2:INTegration?`
Example	`:CCAR0:SEM:BAND:INT 20MHz` `:CCAR0:SEM:BAND:INT?`
Notes	Bandwidth sub op code, 1 is for BTS, 2 for MS. Default is BTS You must be in LTEATDD/LTEAFDD Mode to use this command. Use :INSTrument:SELect to set the mode
Couplings	When System Bandwidth of the parameter set is changed, the value of this parameter also changes as shown in the following table. Note that you cannot set the value exceeding the corresponding System Bandwidth

System Bandwidth	BTS SEM Integ BW	MS SEM Integ BW
1.4 MHz (B1M4)	1.095 MHz	1.08 MHz
3 MHz (B3M)	2.715 MHz	2.7 MHz
5 MHz (B5M)	4.515 MHz	4.5 MHz
10 MHz (B10M)	9.015 MHz	9.0 MHz
15 MHz (B15M)	13.515 MHz	13.5 MHz
20 MHz (B20M)	18.015 MHz	18.0 MHz
200 kHz(B200K)	180 kHz	180 kHz

Preset	4.515 MHz|4.5 MHz
State Saved	Saved in instrument state
Min	100 kHz
Max	20 MHz
Backwards Compatibility SCPI	`[:SENSe]:SEMask:BANDwidth[1]|2:INTegration`

Carrier Config Presets

Lets you configure the Component Carrier presets.

Preset ETC

The ETC configuration is applied. The component carrier parameters are dynamically changed using values of the parameters of each test configuration under Carrier Config Presets menu when some test configuration is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig NONE | ETC1 | ETC2 | ETC3` `[:SENSe]:CCARrier:CONFig?`
Example	`:CCAR:CONF ETC1` `:CCAR:CONF?`
Notes	The control for NONE is not available
State Saved	Saved in instrument state
Range	ETC1|ETC2|ETC3

Max BTS RF Bandwidth

Sets max BS RF bandwidth used when the carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:RFBW <freq>` `[:SENSe]:CCARrier:CONFig:RFBW?`
Example	`:CCAR:CONF:RFBW 40MHz` `:CCAR:CONF:RFBW?`
Preset	40MHz
State Saved	Saved in instrument state
Min	1.4MHz
Max	200 MHz

Carrier Spacing Delta

Sets delta channel spacing used when the carrier configuration preset runs. Channel spacing is determined from this value and the default channel spacing defined in the standard, i.e. Channel spacing = $(BW_{chan1} + BW_{chan2}) * 0.5$ + [the delta spacing]. Since this value is a difference from the default spacing, this value can be negative to allow narrower channel spacing. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:SPACing:DELTa <freq>` `[:SENSe]:CCARrier:CONFig:SPACing:DELTa?`
Example	`:CCAR:CONF:SPAC:DELT -200kHz` `:CCAR:CONF:SPAC:DELT?`
Preset	0Hz
State Saved	Saved in instrument state
Min	-1.0 MHz
Max	10.0 MHz

ETC1 Attributes

Sets ETC1 carrier configuration.

Max Number of Component Carriers

Sets max component carriers placed when the ETC1 carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC1:CMAX <integer>` `[:SENSe]:CCARrier:CONFig:ETC1:CMAX?`
Example	`:CCAR:CONF:ETC1:CMAX 5` `:CCAR:CONF:ETC1:CMAX?`
Preset	5
State Saved	Saved in instrument state
Max	5
Min/Max	1

Component Carrier System BW

Sets bandwidth of the component carriers placed when the ETC1carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC1:BANDwidth B1M4 | B3M | B5M | B10M | B15M | B20M | B200K` `[:SENSe]:CCARrier:CONFig:ETC1:BANDwidth?`
Example	`:CCAR:CONF:ETC1:BAND B5M` `:CCAR:CONF:ETC1:BAND?`
Preset	B5M

State Saved	Saved in instrument state
Range	1.4MHz|3MHz|5MHz|10MHz|15MHz|20MHz|200kHz

Component Carrier Narrowest BW

Sets narrowest bandwidth of the component carriers placed when the ETC1 carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC1:BANDwidth:NARRowest B1M4 | B3M | B5M | B10M | B15M | B20M | B200K` `[:SENSe]:CCARrier:CONFig:ETC1:BANDwidth:NARRowest?`
Example	`:CCAR:CONF:ETC1:BAND:NARR B1M4` `:CCAR:CONF:ETC1:BAND:NARR?`
Preset	B1M4
State Saved	Saved in instrument state
Range	1.4MHz|3MHz|5MHz|10MHz|15MHz|20MHz|200kHz

ETC2 Attributes

Sets ETC2 carrier configuration.

Max Number of Component Carriers

Sets max component carriers placed when the ETC2 carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC2:CMAX <integer>` `[:SENSe]:CCARrier:CONFig:ETC2:CMAX?`
Example	`:CCAR:CONF:ETC2:CMAX 5` `:CCAR:CONF:ETC2:CMAX?`
Preset	5
State Saved	Saved in instrument state
Min	1
Max	5

Carrier Side (with BTS RF BW)

Select the side of RF bandwidth to place the ETC2 component carriers. When this value is changed, the carrier configuration preset is initiated.

- NEGative - Negative (lower) edge of RF bandwidth. If the option is selected, the available component carriers will be placed sequentially from the lower edge of the RF bandwidth starting from first
- POSitive - Positive (upper) edge of RF bandwidth, If the option is selected, the available component carriers will be placed sequentially from the upper edge of the RF bandwidth starting from first

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC2:BANDwidth:SIDE NEGative | POSitive` `[:SENSe]:CCARrier:CONFig:ETC2:BANDwidth:SIDE?`
Example	`:CCAR:CONF:ETC2:BAND:SIDE NEG` `:CCAR:CONF:ETC2:BAND:SIDE?`
Preset	NEGative
State Saved	Saved in instrument state
Range	NEGative|POSitive

Component Carrier System BW

Sets carrier bandwidth of the component carriers placed when the ETC2 carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC2:BANDwidth:CARRier[1]|2|…|5 B1M4 | B3M | B5M | B10M | B15M | B20M | B200K` `[:SENSe]:CCARrier:CONFig:ETC2:BANDwidth:CARRier?`
Example	`:CCAR:CONF:ETC2:BAND:CARR B5M` `:CCAR:CONF:ETC2:BAND:CARR?`
Dependencies	The Carrier Bandwidth is coupled to Max Component Carriers. The settings are enabled following the Max Component Carriers. For example, the 1st Carrier Bandwidth and 2nd Carrier Bandwidth will be available if the Max Component Carriers is 2
Preset	B5M
State Saved	Saved in instrument state
Range	1.4MHz|3MHz|5MHz|10MHz|15MHz|20MHz|200kHz

ETC3 CC Bandwidth

Sets the bandwidth of the component carriers placed when the ETC3 carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC3:BANDwidth B1M4 | B3M | B5M | B10M | B15M | B20M | B200K`

	`[:SENSe]:CCARrier:CONFig:ETC3:BANDwidth?`
Example	`:CCAR:CONF:ETC3:BAND B5M` `:CCAR:CONF:ETC3:BAND?`
Preset	B5M
State Saved	Saved in instrument state
Range	1.4MHz|3MHz|5MHz|10MHz|15MHz|20MHz|200kHz

3.4.13.5 Meas Standard

Enables you to access Preset to Standard functions.

In LTE-Advanced TDD Mode, the parameters under Predefined Params impact the gate or trigger length and delay of the following measurements:

- Monitor Spectrum
- Channel Power
- ACP
- Power Stat CCDF
- Occupied BW
- Spectrum Emission Mask
- Spurious Emission

In LTE-Advanced FDD Mode, the Predefined Parameters in this section are used in the Transmit On/Off Power measurement. The Modulation Analysis measurement has its specific Predefined Parameters setting.

In LTE V2X Mode, Predefined parameters apply to all LTE V2X measurements.

System BW

Sets the demodulator to the specified bandwidth and configures the settings of every component carrier according to the default values listed in table for the current direction (Uplink or Downlink).

For example, when Number of Component is 3, after executing the command RAD:STAN:PRES B5M or selecting corresponding Bandwidth in the dropdown menu, all the 3 component carriers are configured as 5Mhz bandwidth, and all the settings of these 3 component carriers are set according to the table.

Remote	`[:SENSe]:RADio:STANdard:PRESet B1M4 | B3M | B5M | B10M | B15M | B20M | B200K`

Command	
Example	`:RAD:STAN:PRES B5M`
Notes	B200K selection is available in LTE-A FDD mode B200K option is for NB-IoT which requires N9080EM3E license
Couplings	Preset To Standard presets parameter values listed in section "Values for each Preset To Standard". And the system bandwidth of each component carrier under the Component Carrier Setup will be preset to the selected one
Preset	B5M
State Saved	Yes
Range	1.4 MHz (6 RB) | 3 MHz (15 RB) | 5 MHz (25 RB) | 10 MHz (50 RB) | 15 MHz (75 RB) | 20 MHz (100 RB) | 200 kHz (NB-IoT)

UL/DL Config

Sets the TDD UL/DL Allocation parameter of each carrier to the selected value.

Remote Command	`[:SENSe]:RADio:STANdard:PRESet:ULDL CONF0 | … | CONF6` `[:SENSe]:RADio:STANdard:PRESet:ULDL?`
Example	`:RAD:STAN:PRES:ULDL CONF0`
Notes	CONF0: Configuration 0 (DSUUUDSUUU) CONF1: Configuration 1 (DSUUDDSUUD) CONF2: Configuration 2 (DSUDDDSUDD) CONF3: Configuration 3 (DSUUUDDDDD) CONF4: Configuration 4 (DSUUDDDDDD) CONF5: Configuration 5 (DSUDDDDDDD) CONF6: Configuration 6 (DSUUUDSUUD)
Dependencies	When the setting is selected, the ULDL Alloc per component carrier under the Component carrier Setup will be preset to the selected value
Preset	CONF0
State Saved	Yes
Range	Configuration 0|Configuration 1|Configuration 2|Configuration 3|Configuration 4|Configuration 5|Configuration 6

Dw/GP/Up Len

Sets the TDD special sub-frame configuration of each component carrier to the selected value.

Remote Command	`[:SENSe]:RADio:STANdard:PRESet:DGPU CONF0 | … | CONF9` `[:SENSe]:RADio:STANdard:PRESet:DGPU?`

Example	`:RAD:STAN:PRES:DGPU CONF0`
Notes	CONF0: Configuration 0 CONF1: Configuration 1 CONF2: Configuration 2 CONF3: Configuration 3 CONF4: Configuration 4 CONF5: Configuration 5 CONF6: Configuration 6 CONF7: Configuration 7 CONF8: Configuration 8 CONF9: Configuration 9
Dependencies	When the setting is selected, the Dw/GP/Up Len per Component Carrier under the Component Carrier Setup will be preset to the selected value The special sub-frame configuration 9 is only enabled when it is LTE-Advanced TDD
Preset	CONF0
State Saved	Yes
Range	Configuration 0|Configuration 1|Configuration 2|Configuration 3|Configuration 4|Configuration 5|Configuration 6|Configuration 7|Configuration 8|Configuration 9

Analysis Slot

Specifies the starting analysis slot. The measurement will adjust the gate delay or trigger delay according to this parameter.

Remote Command	`[:SENSe]:RADio:SLOT TS0 | TS1 | DPTS1 | UPTS1 | TS4 | TS5 | TS6 | TS7 | TS8 | TS9 | TS10 | TS11 | TS12 | TS13 | TS14 | TS15 | TS16 | TS17 | TS18 | TS19` `[:SENSe]:RADio:SLOT?`
Example	`:RAD:SLOT TS0`
Couplings	Measurement's gate length or meas interval will couple to the parameter
Preset	TS0
State Saved	Yes
Range	TS0 | TS1 | DwPTS1 | UpPTS1 | TS4 | TS5 | TS6 | TS7 | TS8 | TS9 | TS10 | TS11 | TS12(DwPTS2) | TS13 (UpPTS2) | TS14 | TS15 | TS16 | TS17 | TS18 | TS19

Meas Interval

This parameter specifies the desired slots count that needs to be analyzed. The measurement will adjust the gate length or meas interval according to this parameter.

For NB-IoT uplink cases scenarios, when Measure NPRACH is Off, this parameter indicates not only the slots' count to be analyzed, but the time elapse of the off power measurements as well.

In LTE-A FDD Mode, this parameter only appears in the Transmit On|Off Power measurement.

Remote Command	`[:SENSe]:RADio:MINTerval <integer>` `[:SENSe]:RADio:MINTerval`
Example	`:RAD:MINT 1`
Notes	The backwards compatible command [:SENSe]:PVTime:MINTerval is available in LTE FDD & LTE-A FDD Modes
Dependencies	This parameter is disabled when all the below conditions are met at the same time: – System BW is "200 kHz (NB-IoT)" – Direction is "uplink" – NB-IoT Subcarrier Spacing is "3.75kHz" – Meas NPRACH is "OFF"
Couplings	Disabled when the "Measure PRACH" is in scope and its value is not off, then the actual meas interval is the length PRACH or SRS channel For NB-IoT case scenario, when the parameter is disabled, its value is automatically determined by both Meas NPRACH: <table><tr><th>Meas NPRACH</th><th>Meas Interval</th></tr><tr><td>Preamble0</td><td>3 slots</td></tr><tr><td>Preamble1</td><td>4 slots</td></tr></table>
Preset	1
State Saved	Yes
Min	1
Max	20, when System BW is NOT "200 kHz (NB-IoT) 16, otherwise
Backwards Compatibility SCPI	LTE: `[:SENSe]:PVTime:MINTerval`

CP Length

Specifies whether the cyclic prefix is configured as NORMal or EXTended for power measurement. The parameter will affect the gate length or meas interval parameters.

In LTE-A FDD Mode, this parameter only appears in the Transmit On|Off Power measurement.

Remote Command	`[:SENSe]:RADio:CPLength NORMal | EXTended` `[:SENSe]:RADio:CPLength?`
Example	`:RAD:CPL NORM`
Notes	The backwards compatible SCPI command [:SENSe]:PVTime:CPLength is available in LTE FDD & LTE-A FDD Modes
Dependencies	Disabled when System BW is set to "200 kHz (NB-IoT)" and Direction is "uplink"
Couplings	Set to NORMal when System BW is set to "200 kHz (NB-IoT)"
Preset	NORMal
State Saved	Yes
Range	Normal|Extended
Backwards Compatibility SCPI	LTE: `[:SENSe]:PVTime:CPLength`

Measure PRACH/SRS

Specifies whether the analysis slot is used for PRACH channel or SRS and the PRACH preamble format of the analysis slot.

The measurement will adjust the gate length or meas interval according to this parameter.

Remote Command	`[:SENSe]:RADio:MEASure OFF | PPF0 | PPF1 | PPF2 | PPF3 | PPF4 | SRS | DSRS` `[:SENSe]:RADio:MEASure?`
Example	`:RAD:MEAS OFF`
Couplings	If direction is downlink, the control is disabled and the value is set to off If this control value is not off, Meas Interval is disabled
Preset	OFF
State Saved	Yes
Range	Off|Preamble 0|Preamble 1|Preamble 2|Preamble 3|Preamble 4|SRS|DSRS

Reference Config

Specifies which component carrier's ULDL Allocation Configuration and Dw/Up Length Configuration settings are used to adjust time slot to be measured automatically. For Modulation Analysis measurement, this control specifies which CC is used as the reference CC for time alignment results.

In LTE-A FDD Mode, this parameter only appears in the Transmit On|Off Power and Modulation Analysis measurements.

Remote Command	`[:SENSe]:RADio:RCONfig CC0 | … | CC4`

	`[:SENSe]:RADio:RCONfig?`
Example	`:RAD:RCON CC0`
Notes	The options CC1~CC4 can be enabled with 9080B/9082B-2FP license
Dependencies	Reference Configuration is coupled to Number of Component Carriers. For example, reference configuration list will include CC0~CC1 if the number of Component Carriers is 2
Preset	CC0
State Saved	Yes
Range	CC0|CC1|CC2|CC3|CC4

3.4.13.6 Advanced

Contains controls for setting advanced functions of the instrument.

This tab does *not* appear in the following instruments:

- EXM
- VXT model M9420A

Phase Noise Opt

Selects the LO (local oscillator) phase noise behavior for various operating conditions.

Remote Command	`[:SENSe]:ACPower:FREQuency:SYNThesis[:STATe] 1 | … | 5`
	For the meaning of each numeric option value, see "Parameter Options, Installed Options, Auto Rules & Ranges" on page 705 below
	`[:SENSe]:ACPower:FREQuency:SYNThesis[:STATe]?`

Example	`:ACP:FREQ:SYNT 1` `:ACP:FREQ:SYNT?`
Dependencies	Does not appear in all models. For models that do not display this control, the SCPI command is accepted for compatibility (although no action is taken) Not available in VXT models M9410A/11A/15A
Preset	Because this function is in **Auto** after preset, the state of this function after **Preset** will be automatically calculated
State Saved	Saved in instrument state
Range	See "Ranges" on page 709 below

Auto Function

Remote Command	`[:SENSe]:ACPower:FREQuency:SYNThesis:AUTO[:STATe] OFF | ON | 0 | 1` `[:SENSe]:ACPower:FREQuency:SYNThesis:AUTO[:STATe]?`

Example	`:ACP:FREQ:SYNT:AUTO 1` `:ACP:FREQ:SYNT:AUTO?`
Preset	`ON`

Parameter Options, Installed Options, Auto Rules & Ranges

The Phase Noise Optimization control lets you optimize the setup and behavior of the Local Oscillator (LO) depending on your specific measurement conditions. You may wish to trade off noise and speed, for example, to make a measurement faster without regard to noise or with optimum noise characteristics without regard to speed.

Parameter Values Summary

Option	#	Description
"Balanced" on page 706	1	– In instruments with EP0, balances close-in phase noise with spur avoidance – In instruments without EP0 optimizes phase noise for small frequency offsets from the carrier
"Best Wide-offset" on page 706	2	Optimizes phase noise for wide frequency offsets from the carrier
"Fast Tuning" on page 707	3	Optimizes LO for tuning speed
"Best Close-in" on page 706	4 or 1*	– In instruments with EP0, emphasizes close-in phase noise performance without regard to spur avoidance – In instruments without EP0, this setting is accepted but no action is taken
"Best Spurs" on page 706	5	– In instruments with EP0, emphasizes spur avoidance over close-in phase noise performance – In instruments without EP0, this setting is accepted but no action taken
Auto	-	Automatically selects LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions

*Dependent on Option EP0 installation. See "Best Close-in" on page 706 below.

The actual behavior varies somewhat depending on model number and option; for example, you always get Fast Tuning by choosing Option #3, but in some models, "Fast Tuning" on page 707 is identical in effect to "Best Close-in" on page 706.

Best Close-in

Without option EP0

`:FREQ:SYNT 1`

The LO phase noise is optimized for smaller offsets from the carrier, at the expense of phase noise farther out.

The actual frequency offset within which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset <20 kHz]

With option EP0

`:FREQ:SYNT 4`

In instruments with Option EP0, the LO is configured for the best possible close-in phase noise (offsets up to 600 kHz from the carrier), regardless of spurious products that occur with some center frequencies. Because this is generally less desirable for close-in measurements than the "Balanced" on page 706 setting, parameter 1 selects "Balanced" on page 706 in EP0 instruments, in the interests of optimizing code compatibility across the family. Parameter 4 selects "Best Close-in" on page 706, which is usually not as good a choice as "Balanced" on page 706.

Balanced

`:FREQ:SYNT 1`

In instruments with EP0, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ±1 octave around 400 kHz offset. The spurs will always be below –70 dBc.

Best Spurs

`:FREQ:SYNT 5`

In instruments with EP0, the LO is configured for better phase noise than the "Best Wide-offset" on page 706 case close to the carrier, but the configuration has 11 dB worse phase noise than the "Best Close-in" on page 706 case mostly within ±1 octave around 300 kHz offset. Spurs are even lower than in the "Balanced" on page 706 case at better than –90 dBc, whether or not the carrier is on-screen.

This setting is never selected when Phase Noise Optimization is in Auto, you must select it manually.

Best Wide-offset

`:FREQ:SYNT 2`

The LO phase noise is optimized for wider offsets from the carrier. Optimization is especially improved for offsets from 70 kHz to 300 kHz. Closer offsets are compromised and the throughput of measurements (especially remote measurements where the center frequency is changing rapidly), is reduced.

The actual frequency offset beyond which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset >30 kHz]

In instruments with Option EP0, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ±1 octave around 400 kHz offset. The spurs will always be below –70 dBc.

Fast Tuning

`:FREQ:SYNT 3`

In this mode, the LO behavior compromises phase noise at many offsets from the carrier in order to allow rapid measurement throughput when changing the center frequency or span. The term "Fast Tuning" on page 707 refers to the time it takes to move the local oscillator to the start frequency and begin a sweep; this setting does not impact the actual sweep time in any way.

In instruments with EP1, the LO behavior compromises phase noise at offsets below 4 MHz in order to improve measurement throughput. The throughput is especially affected when moving the LO more than 2.5 MHz and up to 10 MHz from the stop frequency to the next start frequency.

In instruments with Option EP0, this is the same configuration as "Best Spurs" on page 706. It is available with the "Fast Tuning" on page 707 label for convenience, and to make the user interface more consistent with other X-Series instrument family members.

(In models whose hardware does not provide for a "Fast Tuning" on page 707 option, the settings for "Best Close-in" on page 706 are used if "Fast Tuning" on page 707 is selected. This gives the fastest possible tuning for that hardware set.)

Auto

`:FREQ:SYNT:AUTO ON`

Selects the LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions. The selection rules are as follows.

Auto Optimization Rules

X-Series instruments have several grades of LO, offering different configurations when in the Auto Mode. The rules for Auto selection are as follows:

Models with Option	Conditions	Selection
EP0 Models with option EP0 have a two stage local oscillator, which switches to a single loop for fast tuning (available in UXA)	Center frequency is < 699.9 kHz	"Balanced" on page 706
	Span > 114.1 MHz, *or* RBW > 800 kHz	"Fast Tuning" on page 707
	RBW > 290 kHz, *or* Span > 4.2 MHz	"Best Wide-offset" on page 706
	Other conditions	"Balanced" on page 706
EP1 Models with option EP1 have a two-loop local oscillator, which switches to a single loop for fast tuning (available in PXA)	Span > 44.44 MHz, *or* RBW > 1.9 MHz, *or* Source Mode is set to “Tracking”	"Fast Tuning" on page 707
	Center frequency is < 195 kHz, *or* CF >= 1 MHz *and* Span <= 1.3 MHz *and* RBW <= 75 kHz	"Best Close-in" on page 706
	All other conditions	"Best Wide-offset" on page 706
EP2 Models with option EP2 use a different loop bandwidth for the fast-tuning choice, which is a compromise between tuning speed and phase noise, giving good tuning speed at all offsets. Although not as good as for "Best Close-in" on page 706; this is useful when you have to look across a wide range of spans (available, for example, in MXA for excellent phase noise)	CF < 130 kHz , *or* CF > 12 MHz *and* Span < 495 kHz *and* RBW < 40 kHz	"Best Close-in" on page 706
	Span > 22 MHz, *or* RBW > 400 kHz, *or* CF ≤ 12 MHz *and* Span < 495 kHz *and* RBW < 23 kHz	"Fast Tuning" on page 707
	All other conditions	"Best Wide-offset" on page 706
EP4 (available in CXA for improved phase noise)	Span > 101 MHz *or* RBW > 1.15 MHz *or* Source Mode is set to “Tracking”	"Fast Tuning" on page 707
	CF is < 109 kHz *or* CF >= 4.95 MHz *and* Span <= 666 kHz *and* RBW < 28 kHz	"Best Close-in" on page 706

Models with Option	Conditions	Selection
	All other conditions	"Best Wide-offset" on page 706
All Other Models Note that in these models, the hardware does not actually provide for an extra-fast tuning option, so the settings for "Fast Tuning" on page 707 are actually the same as "Best Close-in" on page 706, but the rules are implemented this way so that the user who doesn't care about phase noise but does care about tuning speed doesn't have to remember which of the other two settings gives faster tuning	Span > 12.34 MHz, *or* RBW > 250 kHz, *or* Source Mode is set to "Tracking"	"Fast Tuning" on page 707
	Center frequency is < 25 kHz, *or* CF >= 1 MHz *and* Span <= 141.4 kHz *and* RBW <= 5 kHz	"Best Close-in" on page 706
	All other conditions	"Best Wide-offset" on page 706

In all the above cases:

- The RBW to be used in the calculations is the equivalent –3 dB bandwidth of the current RBW filter
- The rules apply whether in swept spans, zero span, or FFT spans

Ranges

Option	Option #	Phase Noise Option	Range
No EPx Option	1	Best Close-in	[offset < 20 kHz]
	2	Best Wide-offset	[offset > 30 kHz]
	3	Fast Tuning	[same as Best Close-In]
EP0	4	Best Close-in	[offset < 600 kHz]
	1	Balanced	[offset < 600 kHz]
	5	Best Spurs	[offset < 600 kHz]
	2	Best Wide-offset	[offset > 800 kHz]
	3	Fast Tuning	[same as Best Close-In]
EP1	1	Best Close-in	[offset < 140 kHz]
	2	Best Wide-offset	[offset > 160 kHz]
	3	Fast Tuning	[single loop]

Option	Option #	Phase Noise Option	Range
EP2, EP3, EP5	1	Best Close-in	[offset < 70 kHz]
	2	Best Wide-offset	[offset > 100 kHz]
	3	Fast Tuning	[medium loop bw]
EP4	1	Best Close-in	[offset < 90 kHz]
	2	Best Wide-offset	[offset > 130 kHz]
	3	Fast Tuning	[same as Best Close-In]

Noise Correction

Sets the measurement noise floor correction function to On or Off. On enables measurement noise correction when the measured power in the reference channel or any offset is close to the noise floor of the instrument. Off turns these corrections off.

In instruments with the noise floor extensions option (option NFE) enabled, there are two ways to compensate for the analyzer noise floor: through the NFE and through this noise corrections control. The techniques are results are similar but not identical. NFE uses a model of the analyzer noise floor, adapted to the current conditions such as center frequency, RBW and ambient temperature. The parameters of this model are measured in the factory or field calibration in a highly averaged measurement. So, they are consistent. However, because the model is imperfect, the corrections are imperfect. Using NFE is very convenient; the user need not wait for the ACP noise corrections calibration to occur. The ACP NC calibration, though, has advantages of being measured very recently, at the current ambient, and the exact center frequency, with no requirement that the model be perfect. So, it will often (but not always) have slightly better dynamic range. If both ACP NC is turned on and NFE is turned on, the instrument uses only the ACP NC. When ACP NC is turned off, but NFE is on, NFE is used, and performance should still be excellent.

When **Meas Method** is Fast Power, HW supported noise correction works when either or both of Noise Correction and NFE is on.

Remote Command	`[:SENSe]:ACPower:CORRection:NOISe[:AUTO] OFF | ON | 0 | 1` `[:SENSe]:ACPower:CORRection:NOISe[:AUTO]?`
Example	`:ACP:CORR:NOIS OFF` `:ACP:CORR:NOIS?`
Dependencies	Not available when "Meas Method" on page 582 is RBW or Fast
Preset	0
State Saved	Saved in instrument state
Range	OFF|ON

Noise Floor Extension

Lets you configure **Noise Floor Extension** (NFE). All Modes that support NFE let you set it on or off. Additionally, some Modes support *two* “on” states for NFE, **Full** and **Adaptive**, as described below.

Adaptive Option Support

At present (Release: X-Apps 2024), support for **Adaptive** NFE is as follows:

Mode	Measurements	Supports Adaptive NFE?
BT	ACP, IBEM, IBSP	No
CQM	MON	Yes
EDGEGSM	EORF, ETSP, MON	No
EMI	APD, DAN, FSC, MON, RTSC, SCH	Yes
LTEAFDD	PVT	No
LTEATDD	PVT	No
MSR	ACP, CHP, MON, OBW, SEM, SPUR	Yes
NR5G	PVT	No
PNOISE	LPL, MON, SFR	No
SA	SAN	Yes
SRCOMMS	ACP, CHP, MON, OBW, SEM, SPUR	Yes
VMA	ACP, CHP, OBW, SEM, SPUR	Yes
WCDMA	ACP, CHP, MON, OBW, SEM, SPUR	Yes
WLAN	CHP, MON, OBW, SEM, SPUR	Yes

The menus and command options are as follows:

NFE State	Modes with Adaptive NFE	Modes without Adaptive NFE	SCPI
Off	**Off**	**Off**	See "NFE On/Off Command" on page 713
On	**Full**	**On**	
Adaptive	**Adaptive**	n/a	See "Adaptive NFE Command" on page 713

As shown in the table above, the **On** state (in Modes that do not support **Adaptive** NFE) matches the **Full** state in Modes that *do* support **Adaptive** NFE.

To maintain SCPI backwards compatibility, the existing command to turn NFE on or off is retained, and a new command is added to set the state to turn **Adaptive**`ON` or `OFF`:

– `[:SENSe]:CORRection:NOISe:FLOor ON|OFF|1|0` is retained, with the default changed to `ON` for Modes that support **Adaptive** NFE

– `[:SENSe]:CORRection:NOISe:FLOor:ADAPtive ON|OFF|1|0` is added (for certain Modes), default = `ON`

When NFE is **On** or **Full**, the expected noise power of the instrument (derived from a factory calibration) is subtracted from the trace data. This will usually reduce the apparent noise level by about 10 dB in low band, and 8 dB in high band (>~3.6 GHz).

NFE works with any RBW, VBW, detector, any setting of **Average Type**, any amount of trace averaging, and any signal type. It is ineffective when the trace is not smoothed (smoothing processes include narrow VBWs, trace averaging, and long sweep times with the detector set to **Average** or **Peak**). It works best with extreme amounts of smoothing, and with the average detector, with the **Average Type** set to **Power**.

In those cases where the cancellation is ineffective, it nonetheless has no undesirable side-effects. There is no significant speed impact to having **Noise Floor Extension** on.

The best accuracy is achieved when substantial smoothing occurs in each point before trace averaging. Thus, when using the **Average** detector, results are better with long sweep times and fewer trace averages. When using the **Sample** detector, the VBW filter should be set narrow with less trace averaging, instead of a wide VBW filter with more trace averaging.

NOTE **Noise Floor Extension** has no effect unless the RF Input is selected, so when External Mixing is selected, it does nothing.

For more details, see "Optimal Detector & Averaging Selections" on page 714 and "Recalibration of Noise Floor" on page 715.

Pros & Cons of Adaptive NFE

Adaptive NFE provides an alternative to fully-on or fully-off NFE. Fully-on NFE can, notably in cases with little or no averaging of the spectrum, result in a display that is distractingly unfamiliar in the variability in response to low level signals. Fully-off NFE fails to achieve the potential improvement in dynamic range and associated accuracy of measurement of low-level signals. **Adaptive** NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement—those settings with high degrees of variance reduction through some variant of averaging. When the potential improvement is small, the display acts like the fully-off case, and when it is high, it acts like the fully-on case, and in-between, application is a compromise between attractiveness and effectiveness.

In **Adaptive** NFE, there is not the same dramatic visual impact on the noise floor as there is in **Full** NFE. **Adaptive** NFE controls the amount of correction that is applied based on other instrument settings like RBW, averaging and sweep time. **Adaptive** NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement, such as settings that provide more averaging. The result is that when not much averaging is being performed, the signal displays more like the fully-off case; and when lots of averaging is being performed, the signal displays more like the **Full** NFE case.

Adaptive NFE is recommended for general-purpose use. For fully-ATE (automatic test equipment) applications, where possible distraction of the instrument user is not a risk, **Full** NFE is recommended.

NFE On/Off Command

Remote Command	`[:SENSe]:CORRection:NOISe:FLOor ON | OFF | 1 | 0` `[:SENSe]:CORRection:NOISe:FLOor?`
Example	`:CORR:NOIS:FLO ON`
Dependencies	Only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear. In those cases, the SCPI command is accepted without error, but has no effect
Couplings	When NFE is enabled in any Mode manually, a prompt is displayed reminding you to perform the **Characterize Noise Floor** operation if it is needed When NFE is enabled through SCPI, and a **Characterize Noise Floor** operation is needed, an error is entered in the system error queue
Preset	Unaffected by **Mode Preset.** Turned `ON` at startup and by **Restore Mode Defaults** in Modes that support **Adaptive.** Turned `OFF` at startup and by **Restore Mode Defaults** in Modes that do *not* support **Adaptive** In Modes that support **Adaptive** NFE, the default (preset) state of NFE is **Adaptive.** In Modes that do not support **Adaptive** NFE, the default state of NFE is **Off**
State Saved	No

Adaptive NFE Command

Only effective in instruments with the NFE or NF2 license installed, and in Modes that support **Adaptive** NFE. For coverage, see "Adaptive Option Support" on page 711 above.

For all other cases, the SCPI command below is accepted without error, but has no effect.

Remote	`[:SENSe]:CORRection:NOISe:FLOor:ADAptive ON | OFF | 1 | 0`

Command	`[:SENSe]:CORRection:NOISe:FLOor:ADAptive?`

Example	First turn NFE on, this is **Full** mode
	`:CORR:NOIS:FLO ON`
	Then set it to **Adaptive**
	`:CORR:NOIS:FLO:ADAP ON`

Couplings	To maintain backwards compatibility, sending :`CORR:NOIS:FLO ON` turns NFE **Adaptive**`OFF`. To turn **Adaptive** on, you must issue the commands in the proper order, as shown in the example above
Preset	Not affected by **Mode Preset**, but set to `ON` at startup and by **Restore Mode Defaults**
State Saved	No

Optimal Detector & Averaging Selections

Note that some measurements do not allow you to switch the **Detector** type (which is set by default to **Average**), so the discussion of detector types here is irrelevant for those measurements. Similarly, some measurements do not allow you to set **Average Type** (set by default to `LOG`), so that discussion here is irrelevant in those cases.

The instrument is characterized in the factory (or during a field calibration) with a model of the noise, referred to the input mixer, versus frequency in each band and path combination. Bands are 0 (low band) and 1 through 4 (high band) in a 26.5 GHz instrument, for example. Paths include normal paths, preamp paths, the electronic attenuator, etc.

In most band/path combinations, the noise can be well characterized based on just two parameters and the instrument frequency response before compensation for frequency-dependent losses.

After the noise density at the input mixer is estimated, the effects of the input attenuator, RBW, detector, etc. are computed to obtain the estimated input-port-referred noise level.

In the simplest case, the measured power (signal plus analyzer noise) in each display point (bucket) is compensated by subtracting the estimated noise power, leaving just the signal power. This is the operation when **Detector** is **Average** and **Average Type** is set to **Power** (`RMS`).

For best operation, **AverageDetector** (default) and **Average Type**. = **Power** are recommended, as already stated. In other cases, operation is often not quite as good but still highly effective. Other **Detector** options, when available, behave as follows:

Positive Peak	The noise floor is estimated based on the RBW and the duration of the bucket using the same equations used in the noise marker function. The voltage of the noise is subtracted from the voltage of the observed signal-plus-noise measurement to compute the estimated signal voltage **Positive Peak** is one example of processing that varies with detector to give good

	estimates of the signal level without the analyzer noise For pulsed-RF, **Positive Peak** can still give excellent effectiveness FFT analysis does not work well, and does not perform NFE well, with pulsed-RF signals, so this combination is *not* recommended
Negative Peak	Not very useful
Sample	Works well, but never better than **Average** , because it does not smooth as well
Normal	A combination of peak and negative peak behaviors, and works about as well as these

For best operation, extreme smoothing is desirable, as already stated. Using narrow VBWs works well, but using very long bucket durations and the average detector works best. Reducing the number of trace points makes the buckets longer.

For best operation, **Average Type** = **Power** (`RMS`) is optimal (when this option is available). When making CW measurements in the presence of noise without NFE, averaging on the decibel scale has the advantage of reducing the effect of noise. Using NFE with **Average Type** = **Log-Power** (`LOG`) is not synergistic, though; NFE with **Average Type** = **Power** (`RMS`) works a little better than NFE with `LOG`.

The results from NFE with internal preamp can often be lower than the theoretical noise in a signal source at room temperature, a noise density of -174 dBm/Hz. This is expected and useful behavior, because NFE is designed to report the amount of input signal that exceeds the thermal noise, not the amount that includes the thermal noise. This can be a useful behavior because thermal noise often interferes with what you want to measure, instead of being part of what you want to measure. Note that NFE is not adequately accurate to always be able to read below kTB.

Recalibration of Noise Floor

In instruments with the NF2 license installed, the calibrated noise floor used by **Noise Floor Extension** should be refreshed periodically. Keysight recommends that the **Characterize Noise Floor** operation be performed after the first 500 hours of operation, *and* once every calendar year. To do this, use "Characterize Noise Floor" on page 2392, under **System**, **Alignments**, **Advanced**. If you have not done this yourself at the recommended interval, then when you turn on **Noise Floor Extension**, the instrument will prompt you to do so with a dialog stating:

This action will take several minutes to perform. Please disconnect all cables from the RF input and press Enter to proceed. Press ESC to cancel, or Postpone to postpone for a week

If you cancel, you will be prompted again the next time you turn NFE on. If you postpone, you will be prompted again after a week passes and you then turn NFE on.

Fast Power RBW Mode

Specifies RBW behavior of Fast Power under **Meas Method**.

Option	SCPI	Description
Best Speed	`SPEed`	The acquisition RBW is set to be configured for best speed. The RBW is automatically calculated, and is not configurable
Explicit	`EXPLicit`	You can configure RBW manually

Remote Command	`[:SENSe]:ACPower:BANDwidth[:RESolution]:FPOWer:MODE SPEed | EXPLicit` `[:SENSe]:ACPower:BANDwidth[:RESolution]:FPOWer:MODE?`
Example	`:ACP:BAND:FPOW:MODE EXPL` `:ACP:BAND:FPOW:MODE?`
Dependencies	Grayed-out when "Meas Method" on page 582 is not Fast Power Not available in VXT models M9410A/11A/15A
Couplings	If `EXPLicit` is selected, "Res BW" on page 553 is configurable. If not, **Res BW** is grayed-out
Preset	`SPEed`
State Saved	Saved in instrument state

Fast Power IF Gain Offset

Lets you optimize for dynamic range versus input signal level.

Remote Command	`[:SENSe]:ACPower:IF:GAIN:FPOWer <integer>` `[:SENSe]:ACPower:IF:GAIN:FPOWer?`
Example	`:ACP:IF:GAIN:FPOW 10` `:ACP:IF:GAIN:FPOW?`
Dependencies	Grayed-out when "Meas Method" on page 582 is not Fast Power Not available in VXT models M9410A/11A/15A
Preset	0
State Saved	Saved in instrument state
Min/Max	-20/20

Integration BW

Selects an Integration BW passband from either -3 dB (`DB3`) or -6 dB (`DB6`).

Remote Command	`[:SENSe]:ACPower:FILTer:BANDwidth[:INTegration] DB3 | DB6` `[:SENSe]:ACPower:FILTer:BANDwidth[:INTegration]?`

Example	`:ACP:FILT:BAND DB3` `:ACP:FILT:BAND?`
Dependencies	Applicable for carriers and offsets whose filter method is not RRC, and when "Meas Method" on page 582 is other than `RBW`
Preset	`DB3`
State Saved	Saved in instrument state
Range	-3 dB|-6 dB

3.4.13.7 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, "Global Center Freq" on page 2276) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to `ON`, it applies to all Modes that support Global settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched `ON`, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Frequency** remains unchanged.

Adjusting the **Center Frequency** of any Mode that supports Global Settings, while **Global Center Freq** is `ON`, modifies the **Global Center Freq**.

When **Global Center Freq** is switched `OFF`, the **Center Frequency** of the current Mode is unchanged, but now the **Center Frequency** of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is `ON`, the **Global Center Freq** is preset to the preset **Center Frequency** of the current Mode.

This function resets to `OFF` when "Restore Defaults" on page 2278 is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:FREQuency:CENTer ALL | NONE` `:INSTrument:COUPle:FREQuency:CENTer?`
Example	`:INST:COUP:FREQ:CENT ALL`

	`:INST:COUP:FREQ:CENT?`
Preset	Set to `OFF` on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	`ALL`|`NONE`

Preset	`OFF`
Backwards Compatibility SCPI	`:GLOBal:FREQuency:CENTer[:STATe] 1 | 0 | ON | OFF` `:GLOBal:FREQuency:CENTer[:STATe]?`

Global EMC Std

When this control is switched `ON`, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the **Global EMC Std**, so you can switch between any of these Modes and the EMC Std remains unchanged.

Adjusting the EMC Std of any Mode that supports Global settings, while **Global EMC Std** is `ON` modifies the **Global EMC Std**.

When **Global EMC Std** is switched `OFF`, the EMC Std of the current Mode remains unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is `ON`, **Global EMC Std** is preset to the preset EMC Std of the current Mode.

This function resets to `OFF` when "Restore Defaults" on page 2278 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:EMC:STANdard ALL | NONE` `:INSTrument:COUPle:EMC:STANdard?`
Example	`:INST:COUP:EMC:STAN ALL` `:INST:COUP:EMC:STAN?`
Dependencies	Only available if Option EMC is installed
Preset	Set to `OFF` on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	`ALL | NONE`

Extend Low Band

The software maintains a Mode Global value called **Extend Low Band**.

Under the current sweep configuration crossing over two bands, when **Extend Low Band** is turned `ON`, the instrument checks whether one band can cover the whole sweep frequency range or not. If it can, then the instrument locks the band; otherwise, it does nothing (the band crossover occurs).

This function does *not* work when **Band Lock** under **System** > **Service** > **Lock Functions** is not -1 (no Band Lock). In that case, **Band Lock** takes priority over **Extend Low Band**.

This function resets to `OFF` when "Restore Defaults" on page 2278 is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:FREQuency:BAND:EXTend 0 | 1 | ON | OFF` `:INSTrument:COUPle:FREQuency:BAND:EXTend?`
Example	`:INST:COUP:FREQ:BAND:EXT 1` `:INST:COUP:FREQ:BAND:EXT?`
Preset	Set to `OFF` by **Global** Settings > **Restore Defaults** and **System** > **Restore Defaults** > **All Modes**
Range	`ON|OFF`

Restore Defaults

Resets all functions in the **Global** settings menu to `OFF`. Pressing **System**, **Restore Defaults**, **All Modes** has the same effect.

Remote Command	`:INSTrument:COUPle:DEFault`
Example	`:INST:COUP:DEF`
Backwards Compatibility SCPI	`:GLOBal:DEFault`

3.4.13.8 Offset RRC Weighting (Backwards Compatibility SCPI)

Example	`:ACP:FILT OFF` `:ACP:FILT?`
Couplings	This command is an alias of: `[:SENSe]:ACPower:OFFSet[1]|2:LIST:FILTer[:RRC][:STATe]` Sending the command sets values of all offsets for BS and MS, but the query always returns a value of BS Offset A
Preset	SA, LTEAFDD, LTEATDD, MSR: `OFF` WCDMA: `ON`
State Saved	Yes

Backwards Compatibility SCPI	`[:SENSe]:ACPower:FILTer[:RRC][:STATe] OFF | ON | 0 | 1`

</table>

3.4.14 Sweep

Accesses controls to configure and control the acquisition of data, and the X-axis parameters of the instrument.

Depending on the selected mode and measurement, these controls might include: **Sweep Time**, **Continuous/Single**, **Pause/Resume**, **X Scale** and **Number of Points**.

3.4.14.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep Time

Controls the time the instrument takes to sweep the current frequency span in swept measurements, displays the sweep time in swept measurements, and displays the equivalent Sweep Time in FFT measurements.

When **Sweep Time** is in Auto, the instrument computes a time that will give accurate measurements based on other settings, such as RBW and VBW.

You can select a shorter sweep time to improve the measurement throughput (with some potential unspecified accuracy reduction), but the **Meas Uncal** indicator will appear if the sweep time you set is less than the calculated Auto Sweep time.

You can also select a longer sweep time, which can be useful (for example) for obtaining accurate insertion loss measurements on very narrowband filters.

NOTE Significantly faster sweep times are available with Option FS1.

NOTE The **Meas Uncal** (measurement uncalibrated) warning is displayed in the Status Bar at the bottom of the screen when the manual Sweep time entered is faster than the time computed by the instrument’s Sweep time equations, that is, the Auto Sweep Time. The instrument’s computed Sweep time will provide accurate measurements; if you sweep faster than this your measurements may be inaccurate. A **Meas Uncal** condition may be corrected by returning the Sweep Time to Auto; by entering a longer Sweep Time; or by choosing a wider RBW and/or VBW.

NOTE On non-sweeping hardware, this control is grayed-out. The value shown on this control is an estimate. It is the measurement’s turnaround time, which is the sum of signal acquisition time, FFT time, and other overhead time, to complete the entire span of the measurement. If you need to specify the same “Sweep Time” as you would for sweeping hardware, send `[:SENSe]:<meas>:SWEep:TIME <time>`. The measurement emulates the “Sweep Time” effect, but this emulation is not straightforward, and therefore the behavior is not specified. Instead, we recommend using Minimum Acquisition Time, which provides better control.

Remote Command	`[:SENSe]:<meas>:SWEep:TIME <time>` `[:SENSe]:<meas>:SWEep:TIME?`

Example	Channel Power measurement:
	`:CHP:SWE:TIME 25ms`
	`:CHP:SWE:TIME?`

Notes	In the ACP measurement in WCDMA Mode, this parameter is preset by **Meas Method** selection. Preset values are as follows: – IBW: 29 ms – IBWR: 108 ms – FAST 7.5 ms
Dependencies	On non-sweeping hardware, this control is grayed out, and the Auto/Man toggle disappears. The read-only control shows estimated sweep time In those instruments, "Minimum Acquisition Time" on page 2127 is available
Couplings	Coupled to **Span**, **RBW**, **VBW**, and **Sweep Time Rules** when **Sweep Time** is set to Auto; **Sweep Time** changes when these parameters are changed When you manually set a value when in the **Auto** state, the state automatically changes to **Man**
Preset	Automatically Calculated unless noted below WCDMA Mode – Channel Power: 1.0 msOBW: 32.6 ms – ACP: 29 ms
State Saved	Saved in instrument state
Min	Other than non-sweeping hardware: Typically, 1 ms Non-sweeping hardware: N/A In the ACP measurement, when **Meas Method** is **Fast Power**, the minimum sweep time is span-dependent and automatically calculated
Max	Other than non-sweeping hardware: 4000 s Non-sweeping hardware: N/A
Annotation	The sweep time is displayed in the lower-right corner of the screen. The number of points is displayed parenthetically, as: Sweep 13.3 ms (1001 points)

	A “#” mark appears before “Sweep” in the annotation when it is switched from Auto to Manual coupling
Status Bits/OPC dependencies	Meas Uncal is Bit 0 in the register: `STATus:QUEStionable:INTegrity:UNCalibrated`

Auto Function

Remote Command	`[:SENSe]:<meas>:SWEep:TIME:AUTO OFF | ON | 0 | 1` `[:SENSe]:<meas>:SWEep:TIME:AUTO?`

Example	Channel Power measurement:
	`:CHP:SWE:TIME:AUTO OFF`
	`:CHP:SWE:TIME:AUTO?`

Preset	WCDMA Mode: `OFF` All others: `ON`

Minimum Acquisition Time

Available on non-sweeping hardware.

Specifies the minimum acquisition time for each “chunk” of the measurement result. The instrument automatically divides Span into multiple chunks if needed. Therefore, the total signal acquisition time for the entire Span is:

~(>~Minimum Acquisition Time) * (The number of chunks)

When in Auto, this parameter’s value is determined by other parameters, such as **Span**, **RBW** and **VBW**.

You can manually increase this parameter value from this Auto value.

If increased, the instrument acquires signal for the specified time duration for each chunk. It performs additional FFTs, and averages or peak-holds the FFT results for a chunk, depending on **Detector** settings.

Note that the actual acquisition time for each chunk may exceed the **Minimum Acquisition Time** value, in order to satisfy FFT time required by other parameters, and to perform an integer number of FFTs.

Remote Command	`[:SENSe]:<meas>:SWEep:ACQuisition:TIME <time>`
	`[:SENSe]:<meas>:SWEep:ACQuisition:TIME?`
	`<meas>` is the identifier for the current measurement; any one of `CHPower|ACPower|OBWidth|MONitor`

Example	Channel Power measurement `:CHP:SWE:ACQ:TIME 500 ms`

	`:CHP:SWE:ACQ:TIME?`
Dependencies	Available only on non-sweeping hardware
Couplings	Coupled to **Span**, **RBW**, and **VBW** when in the Auto state When you manually set a value when in the **Auto** state, the state automatically changes to **Man**
Preset	Automatically calculated
State Saved	Saved in instrument state
Min	100 ns
Max	4.00 ks

Auto Function

Remote Command	`[:SENSe]:<meas>:SWEep:ACQuisition:TIME:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:<meas>:SWEep:ACQuisition:TIME:AUTO?`
	`<meas>` is the identifier for the current measurement; any one of `CHPower-|ACPower|OBWidth|MONitor`

Example	Channel Power measurement: `:CHP:SWE:ACQ:TIME:AUTO OFF`
Preset	`ON`

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See "More Information" on page 725

Remote Command	`:INITiate:CONTinuous OFF | ON | 0 | 1` `:INITiate:CONTinuous?`

Example	Put instrument into **Single** measurement operation:
	`:INIT:CONT 0`
	`:INIT:CONT OFF`
	Put instrument into **Continuous** measurement operation:
	`:INIT:CONT 1`
	`:INIT:CONT ON`

Preset	`ON` Note that `:SYST:PRES` sets `:INIT:CONT` to `ON`, but `*RST` sets `:INIT:CONT` to `OFF`
State Saved	Saved in instrument state
Annunciation	The **Single/Continuous** icon in the Meas Bar changes depending on the setting:

	– A line with an arrow is **Single** – A loop with an arrow is **Continuous**
Backwards Compatibility Notes	X-Series A-models had **Single** and **Cont** hardkeys in place of the **SweepSingleCont** softkey. In the X-Series A-models, if in single measurement, the **Cont** hardkey (and `INIT:CONT ON`) switched to continuous measurement, but never restarted a measurement and never reset a sweep X-Series B-models have a **Cont/Single** toggle control instead of **Single** and **Cont** hardkeys, but it is still true that, if in single measurement, the **Cont/Single** toggle control never restarts a measurement and never resets a sweep

More Information

Continuous Mode	The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the **Average/Hold Num**, the count stops incrementing, but the instrument keeps sweeping See the **Trace** key description under **Trace Average** for the averaging formula used both before and after the **Average/Hold Num** is reached. The trigger condition must be met prior to each sweep The type of trace processing for multiple sweeps is set under the **Trace** key, with choices of **Trace Average**, **Max Hold**, or **Min Hold**
Single Mode	The instrument takes a single sweep when in **Single** mode, or if in average or Max/Min Hold, or if there is a **Waterfall** window displayed, it takes multiple sweeps until the average/hold count reaches the **Average/Hold Num**, then the count stops incrementing, and the instrument stops sweeping See the **Trace** key description under **Trace Average** for the averaging formula used. The trigger condition must be met prior to the sweep The type of trace processing for multiple sweeps is set under the **Trace** key, with choices of **Trace Average**, **Max Hold**, or **Min Hold**

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

- `:INIT:CONT 1` has no effect
- `:INIT:CONT 0` places the instrument in Single Sweep but has no effect on the current sequence until k = N, at which point the current sequence will stop and the instrument will go to the idle state

See "Restart" on page 2279 for details of `:INIT:IMMediate`.

If the instrument is already in **Single** sweep, `:INIT:CONT OFF` has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending `:INIT:IMM` *does* reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending `:CALC:AVER:TCON UP`.

Restart

Restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending `:INIT:IMM`
- Sending `:INIT:REST`

See "More Information" on page 727

Remote Command	`:INITiate[:IMMediate]` `:INITiate:RESTart`
Example	`:INIT:IMM` `:INIT:REST`
Notes	`:INIT:REST` and `:INIT:IMM` perform exactly the same function
Couplings	Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The `STATus:OPERation` register bits 0 through 8 are cleared , *except* bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The `STATus:QUEStionable` register bit 9 (`INTegrity` sum) is cleared The `SWEEPING` bit is set The `MEASURING` bit is set
Backwards	For Spectrum Analysis Mode in ESA and PSA, the **Restart** hardkey and the `:INIT:REST` command

Compatibility Notes	restarted trace averages (displayed average count reset to 1) for a trace in **Clear Write**, but did not restart **Max Hold** and **Min Hold** In X-Series, the **Restart** hardkey and the `:INIT:REST` command restart not only **Trace Average**, but **MaxHold** and **MinHold** traces as well

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command `:CALC:AVER:TCON UP`.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

Event	Trace Effect
Clear/Write pressed (even if already in Clear/Write)	Set to mintracevalue
Max Hold pressed (even if already in Max Hold)	Set to mintracevalue
Min Hold pressed (even if already in Min Hold)	Set to maxtracevalue
Trace Average pressed (even if already in Trace Average)	Trace data unaffected but start new sweep/avg/hold
Restart pressed	Trace data unaffected but start new sweep/avg/hold
Parameter requiring restart changed (e.g., RBW)	Trace data unaffected but start new sweep/avg/hold

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k. This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N, as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K, shows the count for the sweep (data acquisition) in progress. K = k + 1, with a limit of N. The displayed value K changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** un-pauses the measurement. When paused, pressing **Restart** performs a Resume.

Remote Command	`:INITiate:PAUSe` `:INITiate:RESume`
Example	`:INIT:PAUS` `:INIT:RES`
Dependencies	Not displayed in Modes that do not support pausing
Annotation	Only on control

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORt` is sent, the alignment finishes *before* the abort function is performed, so `:ABORt` does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	`:ABORt`
Example	`:ABOR`
Notes	If :`INIT:CONT` is `ON`, then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met If :`INIT:CONT` is `OFF`, then `:INIT:IMM` is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met
Dependencies	For continuous measurement, `:ABORt` is equivalent to the **Restart** key Not all measurements support this command
Status Bits/OPC dependencies	The `STATus:OPERation` register bits 0 through 8 are cleared , *except* bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The `STATus:QUEStionable` register bit 9 (`INTegrity` sum) is cleared Since all the bits that feed into OPC are cleared by `:ABORt`, the Abort command will cause the `*OPC` query to return true

Sweep Time Annotation (Remote Query Only)

Returns the **Sweep Time Annotation** value. Available only on non-sweeping hardware.

This value is also displayed in the result trace window.

The value returned is the estimated turnaround time of each measurement cycle, in seconds. The turnaround time is the sum of the signal acquisition time, FFT time, and other overhead time, to complete the entire span of each measurement cycle.

Remote Command	`[:SENSe]:<meas>:SWEep:ETIMe?` `<meas>` is the identifier for the current measurement; any one of `CHPower|ACPower|OBWidth|MONitor`
Example	Channel Power measurement `:CHP:SWE:ETIMe?`
Dependencies	Available only on non-sweeping hardware
Preset	Automatically calculated

3.4.14.2 Sweep Config

Accesses controls that enable you to configure the Sweep and Control functions of the instrument.

Sweep Time Rules

Switches the instrument between `NORMal` and `ACCuracy` sweep states.

Setting **Auto Sweep Time** to `ACCuracy` results in slower sweep times, usually about three times as long, but yields better amplitude accuracy for CW signals. The instrument amplitude accuracy specifications only apply when **Auto Sweep Time** is set to `ACCuracy`.

Additional amplitude errors that occur when **Auto Sweep Time** is set to `NORMal` are usually well under 0.1 dB, though this is not guaranteed. Because of the faster sweep times and still low errors, `NORMal` is the preferred setting of **Auto Sweep Time**. **Auto Sweep Time** is set to `NORMal` on a **Preset**. This means that in the Preset state, instrument amplitude accuracy specifications do not apply.

Remote Command	`[:SENSe]:ACPower:SWEep:TIME:AUTO:RULes NORMal | ACCuracy` `[:SENSe]:ACPower:SWEep:TIME:AUTO:RULes?`
Example	`:ACP:SWE:TIME:AUTO:RUL NORM` `:ACP:SWE:TIME:AUTO:RUL?`

Dependencies	Does not appear in Spectrum Analyzer Mode in VXT model M9420A
Preset	**Modes, Instruments** — **Value** SA, WCDMA, LTEAFDD, LTEATDD, MSR — `ACCuracy` 5G NR — `NORMal` 5G NR in VXT models M9410A/11A/15A — `ACCuracy`
State Saved	Saved in instrument state
Range	`NORMal|ACCuracy`

Points

Sets the number of points taken per sweep, and displayed in the traces. The current value of points is displayed parenthetically, next to the sweep time in the lower-right corner of the display. Using more points provides greater resolution. Using fewer points compacts the data and decreases the time required to access a trace over the remote interface.

Increasing the number of points does not increase the sweep time. However, it can slightly impact the trace processing time and therefore the overall measurement speed. Decreasing the number of points does not decrease the sweep time, but it may speed up the measurement, depending on the other sweep settings (for example, in FFT sweeps). Fewer points will always speed up the I/O.

Due to minimum sweep rate limitations of the hardware, the minimum sweep time available will increase above its normal value of 1 ms as the number of sweep points increases above 15001.

Changing the number of sweep points has several effects on the instrument. Since markers are read at the point location, the marker reading may change. The sweep time resolution changes. Trace data for all the traces is cleared and, if **Sweep** is in **Cont**, a new trace is taken. If any trace is in average or hold, the averaging starts over.

Because of sweep time quantization issues, the knob and up/down keys cannot be used to adjust the number of points.

When in a split screen display each window may have its own value for points.

When sweep points is changed, an informational message "Sweep points changed, all traces cleared" is displayed and in 5G NR Mode, **Auto Sweep Points** is set to `OFF` (0).

Remote Command	`[:SENSe]:ACPower:SWEep:POINts <integer>` `[:SENSe]:ACPower:SWEep:POINts?`
Example	`:ACP:SWE:POIN 500`

	`:ACP:SWE:POIN?`
Dependencies	Not available when Signal ID is On in External Mixing Neither the knob nor the step keys can be used to change this value. If it is tried, a warning is given Not displayed in Modes that do not support **Swept** This parameter is automatically calculated and not configurable when **Meas Method** is set to Fast Power
Couplings	Whenever the number of sweep points change: – All trace data is erased – Any traces with Update Off will also go to Display OffSweep time is re-quantized – Any limit lines that are on will be updated – If averaging/hold is on, averaging/hold starts over – **Auto Sweep Points** is set to `OFF` (5G NR Mode only) The resolution of setting the sweep time depends on the number of points selected
Preset	5G NR Mode, in all models except M9410A/11A/15A: 5001 All others: 1001
State Saved	Saved in instrument state
Min	1
Max	20001
Annotation	On second line of annotations, in lower right corner in parenthesis behind the sweep annotation

3.4.14.3 X Scale

Accesses controls that enable you to set the horizontal scale parameters.

Auto Scaling

Toggles the scale coupling function On or Off.

Remote Command	`:DISPlay:ACPower:VIEW[1]:WINDow[1]:TRACe:X[:SCALe]:COUPle 0 | 1 | OFF | ON` `:DISPlay:ACPower:VIEW[1]:WINDow[1]:TRACe:X[:SCALe]:COUPle?`
Example	`:DISP:ACP:WIND:TRAC:X:COUP ON` `:DISP:ACP:WIND:TRAC:X:COUP?`
Couplings	When **Auto Scaling** is ON and the "Restart" on page 2279 front-panel key is pressed, this function automatically determines the scale per division and reference values based on the measurement results

	When you set a value to either **Scale/Div** or **Ref Valu**e manually, **Auto Scaling** automatically changes to `OFF`
Preset	`OFF`
State Saved	Saved in instrument state
Range	`OFF|ON`
Backwards Compatibility SCPI	`:DISPlay:ACPower:VIEW[1]:WINDow[1]:TRACe:X[:SCALe]:COUPle`

3.4.15 Trace

Lets you control the acquisition, display, storage, detection and manipulation of trace data for the available traces. The Trace Control tab of this menu contains radio-button selections for the trace type (**Clear/Write, Trace Average, Max Hold, Min Hold**) and **View/Blank** setting for the selected trace.

For the Spectrum Analyzer Mode, when in **Single** Mode, Measurements and their Views save the trace data from the last acquisition. This is true for multiple screens. The marker and trace data will be present whenever the measurement is brought back into focus. The measurement switches for these measurements do not clear the traces, so the data will be present until the next acquisition is completed.

3.4.15.1 Select Trace

Specifies the *selected trace*, which is the trace that will be affected when you change trace settings.

Select Trace appears above the menu panel, indicating that it applies to *all* controls in the menu panel. **Select Trace** is blanked if you select a tab whose controls do *not* depend on the selected trace (for example, **Trace Function**).

Notes	The selected trace is remembered even when not in the **Trace** menu
Dependencies	For the Swept SA measurement: – In Image Suppress mode, when you select a trace it becomes the active trace, and the formerly active trace goes into View – When you turn on Image Suppress, Update turns off for all traces except the selected trace For the ACP measurement, when **Meas Method** is `RBW`, `FAST` or `FPOWer`, **Select Trace** is disabled
Preset	Trace 1
State Saved	Yes

3.4.15.2 Trace Control

The controls on this tab allow you to set the "Trace Type" on page 2137 and its update mode.

There are four Trace Types:

- Clear/Write
- Trace Average
- Max Hold
- Min Hold

Each type handles data in a different way.

Each trace also has two values that determine whether it is being written or not, and whether it is being displayed or not. These values, **Update** and **Display,** are described fully in the "View/Blank" on page 2142 control description. Essentially, when **Update** is `ON`, a trace is updating, and when **Update** is `OFF` it is not. When **Display** is `ON`, it is visible and when **Display** is `OFF` it is not. These terms are used throughout the descriptions in this section.

Trace Type

There are four trace Types:

Option	Parameter	SCPI Example	Details
Clear/Write	`WRITe`	`:TRAC2:TYPE WRIT`	See: "Clear/Write" on page 737
Trace Average	`AVERage`	`:TRAC2:TYPE AVER`	See: "Trace Average" on page 738
Maximum Hold	`MAXHold`	`:TRAC3:TYPE MAXH`	See: "Max Hold" on page 738
Minimum Hold	`MINHold`	`:TRAC5:TYPE MINH`	See: "Min Hold" on page 739

Full descriptions of each type are provided below. You may select one of these types for each trace. Re-selecting the current **Trace Type** initiates the same action that selecting it the first time did, even though it is already selected. For example, selecting **Clear/Write** while **Clear/Write** is already selected will nonetheless clear the trace and begin rewriting it.

Besides the **Trace Type**, the "View/Blank" on page 2142 state must be set to **Active** (**Update**: `ON`, **Display**: `ON`) for a trace to be updating and visible. Selecting any **Trace Type** automatically makes the trace **Active**.

See also: "Trace Mode Backwards Compatibility Commands" on page 735

Remote For Swept SA Measurement (in SA Mode):

Command	`:TRACe[1]|2|…|6:TYPE WRITe | AVERage | MAXHold | MINHold`
	`:TRACe[1]|2|…|6:TYPE?`
	For all other measurements:
	`:TRACe[1]|2|3:<meas>:TYPE WRITe | AVERage | MAXHold | MINHold`
	`:TRACe[1]|2|3:<meas>:TYPE?`
	where `<meas>` is the identifier for the current measurement

Example	`:TRAC:TYPE WRIT` `:TRAC:TYPE?`
Couplings	Selecting a **Trace Type** (by pressing any of the Trace Type selections or sending `:TRAC:TYPE`) sets the Trace to **Active** (**Update**: `ON`, **Display**: `OFF`), even if the same trace type was already selected When Detector setting is "Auto" (`[:SENSe]:<meas>:DETector:AUTO?)`, Detector `([:SENSe]:<meas>:DETector[:FUNCtion]?`) switches aligning with the switch of this parameter: "`NORMal`" with `WRITe` (Clear Write), "`AVERage`" with `AVERage`, "`POSitive` (peak)" with `MAXHold`, and "`NEGative` (peak)" with `MINHold`
Preset	Swept SA and Monitor Spectrum: `WRITe` All other measurements: `AVERage` Following **Preset**, all traces are cleared (all trace points set to mintracevalue)
State Saved	The type of each trace is saved in instrument state
Annunciation	The type for each trace is indicated in the Trace annunciator panel on the Measurement Bar

Trace Mode Backwards Compatibility Commands

In earlier instruments, the "Trace Modes" were: Clear/Write, Max Hold, Min Hold, View and Blank. Averaging was global to all traces and was controlled under the **BW/Avg** menu.

In X-Series, trace averaging can be done on a per-trace basis. The Trace Modes (now called Trace Types) are Clear/Write, Trace Average, Max Hold and Min Hold. View and Blank are set separately under "View/Blank" on page 2142.

While this provides more flexibility, it also gives rise to potential backwards compatibility problems. To mitigate these, the old Trace Mode command has been retained and a new Trace Type command has been added. The :`TRACe:MODE` command is retained for backwards compatibility, and the :`TRACe:TYPE`, :`TRACe:UPDate` and :`TRACe:DISPlay` commands introduced for ongoing use. The old Trace Modes are selected using `:TRAC:MODE`, whose parameters are mapped into calls to `:TRACe:TYPE`, `:TRACe:UPDate` and `:TRACe:DISPlay`, and the old global Averaging command `[:SENSe]:AVERage[:STATe]` is provided for backwards compatibility. See the individual command descriptions for details.

When **Average/Hold** in the **Meas Setup**, **Legacy Compatibility** menu is `ON`, the following is true for traces in Max Hold and Min Hold:

- They ignore the **Average/Hold** number; **Single** for Max Hold causes one sweep only, so switching to **Single** stops after the current sweep, and switching to **Cont** starts again without clearing the accumulated result
- Max Hold is not cleared on a **Restart**, **Single** or `:INIT:IMM`, but changing a measurement parameter, like frequency or bandwidth etc., still restarts the Max Hold

Preset	`WRITe`
State Saved	The trace mode is an alias only
Backwards Compatibility SCPI	`:TRACe[1]|2|…|6:MODE WRITe | MAXHold | MINHold | VIEW | BLANk` `:TRACe[1]|2|…|6:MODE?`
Backwards Compatibility Notes	The legacy `:TRACe:MODE` command is retained for backwards compatibility. In conjunction with the legacy `:AVErage` command, it works as follows: – `:AVErage ON|OFF` sets/clears a variable that we will call average for the sake of this discussion. This variable is maintained by the instrument solely for backwards compatibility. See the `[:SENSe]:AVERage[:STATe]` command description below – `:TRACe:MODE WRITe` sets `:TRACe:TYPE WRITe` (Clear/Write) unless average is true, in which case it sets it to `:TRACe:TYPE AVErag`e. It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace – `:TRACe:MODE MAXHold` sets `:TRACe:TYPE MAXHold` (Max Hold). It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace – `:TRACe:MODE MINHold` sets `:TRACe:TYPE MINHol`d (Min Hold). It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace – `:TRACe:MODE VIEW` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay ON`, for the selected trace – `:TRACe:MODE BLANk` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay OFF`, for the selected trace The query returns the same value as `:TRACe:TYPE?`, meaning that if you set `:TRACe:MODE:VIEW` or `:TRACe:MODE:BLANk`, the query response will not be what you sent `:TRACe[n]:MODE` was formerly used to set the type or "writing mode" of the trace. At that time, View and Blank were writing modes. The new `:TRACe:TYPE` command should be used in the future, but `:TRACe:MODE` is retained to provide backwards compatibility In X-Series, unlike earlier instruments, Max Hold and Min Hold now obey the Average Number and counts up to a terminal value as Average always has As the **Average/Hold Number** now affects **Min Hold** and **Max Hold**, the operations that restart Averaging (for example, the **Restart** key) now also restart **Min Hold** and **Max Hold** As a result of these changes, legacy code that restarts averaging while retaining a running Max Hold will need to be rewritten, because the Max Hold will now restart when the Average does Also, previous to X-Series:

	– Pressing **Max Hold** while already in **Max Hold** (or doing so remotely) had no effect. Now it will clear the trace and restart the sweep and the Max Hold sequence – Changing the vertical scale (Log/Lin or dB/div) of the display restarted **Max Hold** and **Min Hold**. This is no longer the case
Preset	`OFF`
State Saved	The state of Average is saved in Instrument State for ghosting purposes
Backwards Compatibility SCPI	`[:SENSe]:AVERage[:STATe] ON | OFF | 1 | 0` `[:SENSe]:AVERage[:STATe]?`
Backwards Compatibility Notes	Previous to X-Series, Averaging (also sometimes known as trace averaging) was global to all traces, that is, it was either on or off for all active traces. The legacy command `[:SENSe]:AVERage [:STATe] ON|OFF|1|0` was used to turn Averaging on or off In X-Series, Averaging is turned on or off on a per-trace basis, so it can be on for one trace and off for another For backwards compatibility, the old global Average State variable is retained solely as a legacy variable, turned on and off and queried by the legacy command `[:SENSe]:AVERage[:STATe] OFF|ON|0|1.` When Average is turned on, any trace in Clear/Write will get put into Average. While Average is on, any trace put into Clear/Write by the old `:TRAC:MODE` command will instead get put into Average. When Average is turned off, any trace in Average will get put into Clear/Write

Trace Type Details

Clear/Write

Each trace update replaces the old data in the trace with new data.

Pressing **Clear/Write** for the selected trace, or sending `:TRAC:TYPE WRIT` for the specified trace, sets the trace type to **Clear/Write** and clears the trace, even if you are already in **Clear/Write**. Then a new sweep is initiated. Trigger conditions must be met before the sweep actually starts, and if in **Single** the sweep won’t start until **Restart** is pressed.

Pressing **Clear/Write** stops the current sweep and initiates a new one, so **Trace Average, Max Hold** and **Min Hold** data may be interrupted in mid-sweep when **Clear/Write** is pressed, and therefore may not accurately reflect the displayed count. Therefore, when **Clear/Write** is pressed for one trace, **Trace Average, Max Hold** and **Min Hold** must restart for all traces.

When in **Clear/Write**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), a new sweep is initiated but the trace is not cleared.

Trace Average

The instrument maintains and displays an average trace, which represents the cumulative average on a point-by-point basis of the new trace data and previous averaged trace data.

Pressing **Trace Average** (for the selected trace), or sending `:TRAC:TYPE AVER` (for the specified trace), sets the trace type to **Trace Average**, clears the trace, initiates a new sweep, and restarts the Average sequence.

Details of the count limiting behavior and the averaging calculations may be found under **Avg|Hold Number** and **Average Type** under **Meas Setup.**

When in **Trace Average**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like Center Frequency or Attenuation), the average restarts and a new sweep is initiated but the trace is not cleared.

Restarting the average means:

- The average/hold count k is set to 1, so that the next time the average trace is displayed it simply represents one trace of new data
- A new sweep is initiated
- Once the new sweep starts, the trace is overwritten with current trace data as the first trace of the new average

Remember that restarting averaging also restarts **Max Hold** and **Min Hold**, as there is only one count for Trace Average and Hold.

Max Hold

The instrument maintains and displays a max hold trace, which represents the maximum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under **Meas Setup.**

Pressing **Max Hold** for the selected trace, or sending `:TRAC:TYPE MAXH` for the specified trace, sets the Trace Type to **Max Hold,** clears the trace , initiates a new sweep, and restarts the hold sequence, even if you are already in **Max Hold**.

When in **Max Hold**, if a measurement-related instrument setting is changed(that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Max Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Max Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the max hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated.

Remember that restarting **Max Hold** also restarts averaging and **Min Hold**, as there is only one count for Trace Average and Hold.

Min Hold

The instrument maintains and displays a min hold trace, which represents the minimum data value on a point-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under the **Meas Setup** functions.

Pressing **Min Hold** for the selected trace, or sending `:TRAC:TYPE MINH` for the specified trace, sets the Trace Type to **Min Hold,** clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Min Hold**.

When in **Min Hold**, if a measurement-related instrument setting is changed(that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Min Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Min Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the min hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated

Remember that restarting **Min Hold** also restarts **Max Hold** and averaging, because there is only one count for Trace Average and Hold.

Clear and Write | Restart Averaging | Restart Max/Min Hold

Starts the trace writing, as though the "Trace Type" on page 2137 had just been selected. The effect is exactly the same as reselecting the current **Trace Type** again – the control is provided because it may not be obvious that reselecting the same selection from a radio button menu will take any action.

This control displays different labels, depending on the selected Trace Type:

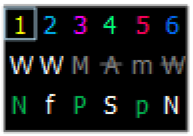
- **Clear/Write**: Clear and Write
- **Trace Average**: Restart Averaging
- **Max Hold**: Restart Max Hold
- **Min Hold**: Restart Min Hold

View/Blank

Lets you set the state of the two trace variables: **Update** and **Display**. The choices available in this dropdown menu are:

Active	Update and Display both ON
View	Update OFF; Display ON
Blank	Update OFF; Display OFF
Background	Update ON, Display OFF Allows a trace to be blanked *and* continue to update “in the background”, which was not possible in the past

In the Swept SA measurement, a trace with **Display**OFF is indicated by a strikethrough of the type letter in the trace annotation panel in the Measurement Bar. A trace with **Update**OFF is indicated by dimming the type letter in the trace annotation panel in the Measurement Bar. In the example below, Traces 3, 4, 5 and 6 have **Update**OFF, and Traces 4 and 6 have **Display**OFF.



See: "More Information" on page 742

Notes	For the commands to control the two variables, Update and Display, see "Trace Update State On/Off" on page 740 and "Trace Display State On/Off" on page 741 below
Dependencies	When Signal ID is on, this key is grayed-out
Couplings	Selecting a Trace Type for a trace (pressing the key or sending the equivalent command) puts the trace in **Active** (Update ON and Display ON), even if that trace type was already selected Selecting a detector for a trace (pressing the key or sending `[:SENS]:DET:TRAC`) puts the trace in **Active** (**Update**ON and **Display**ON), even if that detector was already selected Selecting a "Math Function" on page 1145 other than OFF for a trace (pressing the key or sending the equivalent command) puts the trace in **Active** (**Update**ON and **Display**ON), even if that Math Mode was already selected Loading a trace from a file puts that trace in **View** regardless of the state it was in when it was saved; as does being the target of a **Copy** or a participant in an **Exchange**

Trace Update State On/Off

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe[1]|2|…|6:UPDate[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|…|6:UPDate[:STATe]?`
	For all other measurements:

	`:TRACe[1]|2|3:<meas>:UPDate[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|3:<meas>:UPDate[:STATe]?`
	where <meas> is the identifier for the current measurement

Example	Make trace 2 inactive (stop updating): `:TRAC2:UPD 0`
Couplings	Whenever you set **Update** to ON for any trace, the **Display** is set to ON for that trace

Preset	For Swept SA Measurement (in SA Mode):
	`1|0|0|0|0|0`
	ON for Trace 1; OFF for 2–6
	For all other measurements:
	`1|0|0`
	ON for Trace 1; OFF for 2 &3

State Saved	Saved in instrument state

Trace Display State On/Off

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe[1]|2|…|6:DISPlay[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|…|6:DISPlay[:STATe]?`
	For all other measurements:
	`:TRACe[1]|2|3:<meas>:DISPlay[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|3:<meas>:DISPlay[:STATe]?`
	where <meas> is the identifier for the current measurement

Example	Make trace 1 visible:
	`:TRAC2:DISP 1`
	Blank trace 3:
	`:TRAC3:DISP 3`

Couplings	Whenever you set **Update** to ON for any trace, the **Display** is set to ON for that trace

Preset	For Swept SA Measurement (in SA Mode):
	`1|0|0|0|0|0`
	ON for Trace 1; OFF for 2–6
	For all other measurements:
	`1|0|0`
	ON for Trace 1; OFF for 2 &3

State Saved	Saved in instrument state

More Information

When a trace becomes inactive, any update from the `:SENSe` system (detectors) immediately stops, without waiting for the end of the sweep. The trace data remains unchanged, but stops updating. If the trace is blanked, this still does not affect the data in the trace. Traces that are blanked (**Display**=`OFF`) do not display nor appear on printouts, but their data stays intact, they may be queried, and markers may be placed on them

In most cases, inactive traces are static and unchanging; however, there are cases when an inactive trace will update, specifically:

- if data is written to that trace from remote
- if trace data is loaded from mass storage
- if the trace is the target of a **Copy** or participant in an **Exchange**
- if the trace is cleared using **Clear Trace**

Inactive traces that are also being displayed (traces in **View**) are displayed at half intensity. Traces in **View** display across the entire X-Axis of the instrument. Their horizontal placement does not change, even if X-Axis settings subsequently are changed, although Y-Axis settings do affect the vertical placement of data.

When a trace becomes active (**Update**=`ON`), the trace is cleared, the average count is reset, and a new sweep is initiated.

Note that putting a trace into **Display**=`OFF` and/or **Update**=`OFF` does *not* restart the sweep and does *not* restart Averaging or Hold functions for any traces.

3.4.15.3 Math

Lets you turn on and configure Trace Math functions.

Math Function

Trace Math functions perform mathematical operations between traces and, in some cases, user-specified offsets. When in a Trace Math function, the indicated function is performed during the sweep with the math function used in place of a detector. The trace operands for the math function are set using the "Operand 1 / Operand 2" on page 1151 controls.

- See "How trace math is processed" on page 747

Remote Command	For option details, see "Trace Math Options" on page 744 For Swept SA Measurement (in SA Mode):

`:CALCulate:MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>`

`:CALCulate:MATH? <trace_num>`

where `<trace_num>` is any one of:

`TRACE1|…|TRACE6`

For all other measurements:

`:CALCulate:<meas>:MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>`

`:CALCulate[:<meas>]:MATH? <trace_num>`

where:

`<meas>` is the identifier for the current measurement, and

`<trace_num>` is any one of:

`TRACe1|TRACe2|TRACe3`

Note that the format of the `TRACe<n>` parameter differs from that for the Swept SA Measurement

Example

`:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0`

Sets Trace 3 to Power Diff trace math function, and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2

`:CALC:MATH TRACE3,PSUM,TRACE1,TRACE2,0,0`

Sets Trace 3 to Power Sum trace math function and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2

`:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`

Sets Trace 3 to Log Offset trace math function, sets the First Trace operand (for Trace 3) to Trace 1, leaves the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and sets the Log Offset (for Trace 3) to -6 dB

`:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00`

Sets Trace 3 to Log Diff trace math function, sets the First Trace operand (for Trace 3) to Trace 1, sets the Second Trace operand (for Trace 3) to Trace 2, and sets the Log Difference reference (for Trace 3) to -6 dBm

`:CALC:MATH TRACE1,OFF,TRACE2,TRACE3,0,0`

Turns off trace math for trace 1

Notes

The Trace Math Function command has 6 main set of parameters:

- Set 1 defines the “result trace”:

`TRACE1|…|TRACE6`

-Set 2 defines the “function”:

`PDIFference|PSUM|LOFFset|LDIFference|OFF`

- Set 3 is a “trace operand” (1):

`TRACE1|…|TRACE6`

- Set 4 is a “trace operand” (2):

`TRACE1|…|TRACE6`

	- Set 5 defines the "Log Offset" (in dB) - Set 6 defines the "Log Difference Reference" (in dBm) Note that the trace math mode is an enumeration; that is, when a math function is set for a trace, it turns off any math function that is on for that trace, then sets the new math function The parameters sent in the command are reflected in the values in the control menu. There is no default for any parameter; all 6 parameters must be sent to satisfy the parser. Failure to specify a parameter will result in a missing parameter message The query returns the math mode, the operand traces, the offset and the reference for the specified trace, all separated by commas
Dependencies	Trace Math is not available if **Normalize** is on Trace Math is not available if Signal ID is on None of the trace operands can be the destination trace. If any of the three trace math commands is sent with a destination trace number matching one of the operands, a warning is generated and the function does not turn on
Couplings	When a math function is changed for a trace, that trace is set to Display = `ON`; and Update = `ON`

Preset	For Swept SA Measurement (in SA Mode):
	`OFF,TRACE5,TRACE6,0,0 | OFF,TRACE6,TRACE1,0,0 | OFF,TRACE1,TRACE2,0,0 | OFF,TRACE2,TRACE3,0,0 | OFF,TRACE3,TRACE4,0,0 | OFF,TRACE4,TRACE5,0,0`
	For all other measurements:
	`OFF,TRACE2,TRACE3,0,0 | OFF,TRACE3,TRACE1,0,0 | OFF,TRACE1,TRACE2,0,0`

State Saved	The trace math function for each trace is saved in instrument state
Annunciation	An "f" is shown on the trace annunciation panel in the Measurement Bar when a math function is on; and the function is annotated on the trace if Trace Annotation is on
Status Bits/OPC dependencies	`*OPC` can be used to detect the completion of a sweep, which will also correspond to the completion of the math operation, since all math takes place during the sweep

Trace Math Options

IMPORTANT

To generate a trace math result, *you must take a sweep*. The trace math engine, described below, operates in concert with the sweep engine in the instrument. Until a sweep has been taken, even if the constituent traces are not in Update mode, no result is generated.

Note that certain events can affect the trace in ways that affects all points at once. This can happen in any number of ways, including:

- A trace clear taking place
- A trace being loaded from the file system

- Trace data being sent in from the remote interface
- A copy or exchange of trace data

You should try to avoid these occurrences during a sweep, as they will tend to invalidate the math result being accumulated.

The Trace Math functions are:

Power Diff (Op1 - Op2)

Calculates a power difference between the `First Trace` operand and the `Second Trace` operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace:

```
DestinationTrace = 10 log(10(1/10)(FirstTrace) – 10(1/10)(SecondTrace))
```

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in `FirstTrace` is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

Otherwise, if the result of the subtraction is less than or equal to 0, the resultant point is `mintracevalue`.

Power Sum (Op1 + Op2)

Calculates a power sum between the `First Trace` operand and the `Second Trace` operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

```
DestinationTrace = 10 log(10(1/10)(FirstTrace) + 10(1/10)(SecondTrace))
```

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in either trace operand is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

Log Offset (Op1 + Offset)

Calculates a log offset from the `First Trace` operand and puts the result in the destination trace. This is like the B-DL function in some older instruments. The offset is entered on the `Offset` control, which only appears when this math function is in force for the selected trace. Each destination trace has its own offset.

During the sweep, the following formula is executed for each point in the trace operand, and the corresponding point is generated for the destination trace.

```
DestinationTrace = FirstTrace + Offset
```

The values of the trace points are assumed to be in dBm (as they are internally stored) and the offset is in dB.

If a point in the trace operand is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

If a point in the trace operand is equal to `mintracevalue`, the resultant point is also `mintracevalue`.

Example: If offset is 25 dB, then our destination trace will be higher than the operand trace by 25 dB.

Note that the `Second Trace` operand is not used for this function.

Log Diff (Op1 - Op2 + Ref)

Offsets the difference between the `First Trace` operand and the `Second Trace` operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

Offsets the difference between the `First Trace` operand and the `Second Trace` operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

```
DestinationTrace = (FirstTrace - SecondTrace) + Reference
```

The values of the operand trace points are assumed to be in decibel units (as they are internally stored) and the reference is in dBm so the result is in dBm.

Example: If the first operand trace 1 is at 5 dBm, the second operand trace 2 is at –5 dBm, and the reference is –25 dBm, then the destination trace will be –15 dBm.

Example: If the first operand trace1 is at 60 dBuV, the second operand trace 2 is at 50 dBuV, and the reference is 35 dBuV, then the destination trace will be 45 dBuV.

If a point in `FirstTrace` is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

If a point in `FirstTrace` is equal to `mintracevalue`, the resultant point is also `mintracevalue`.

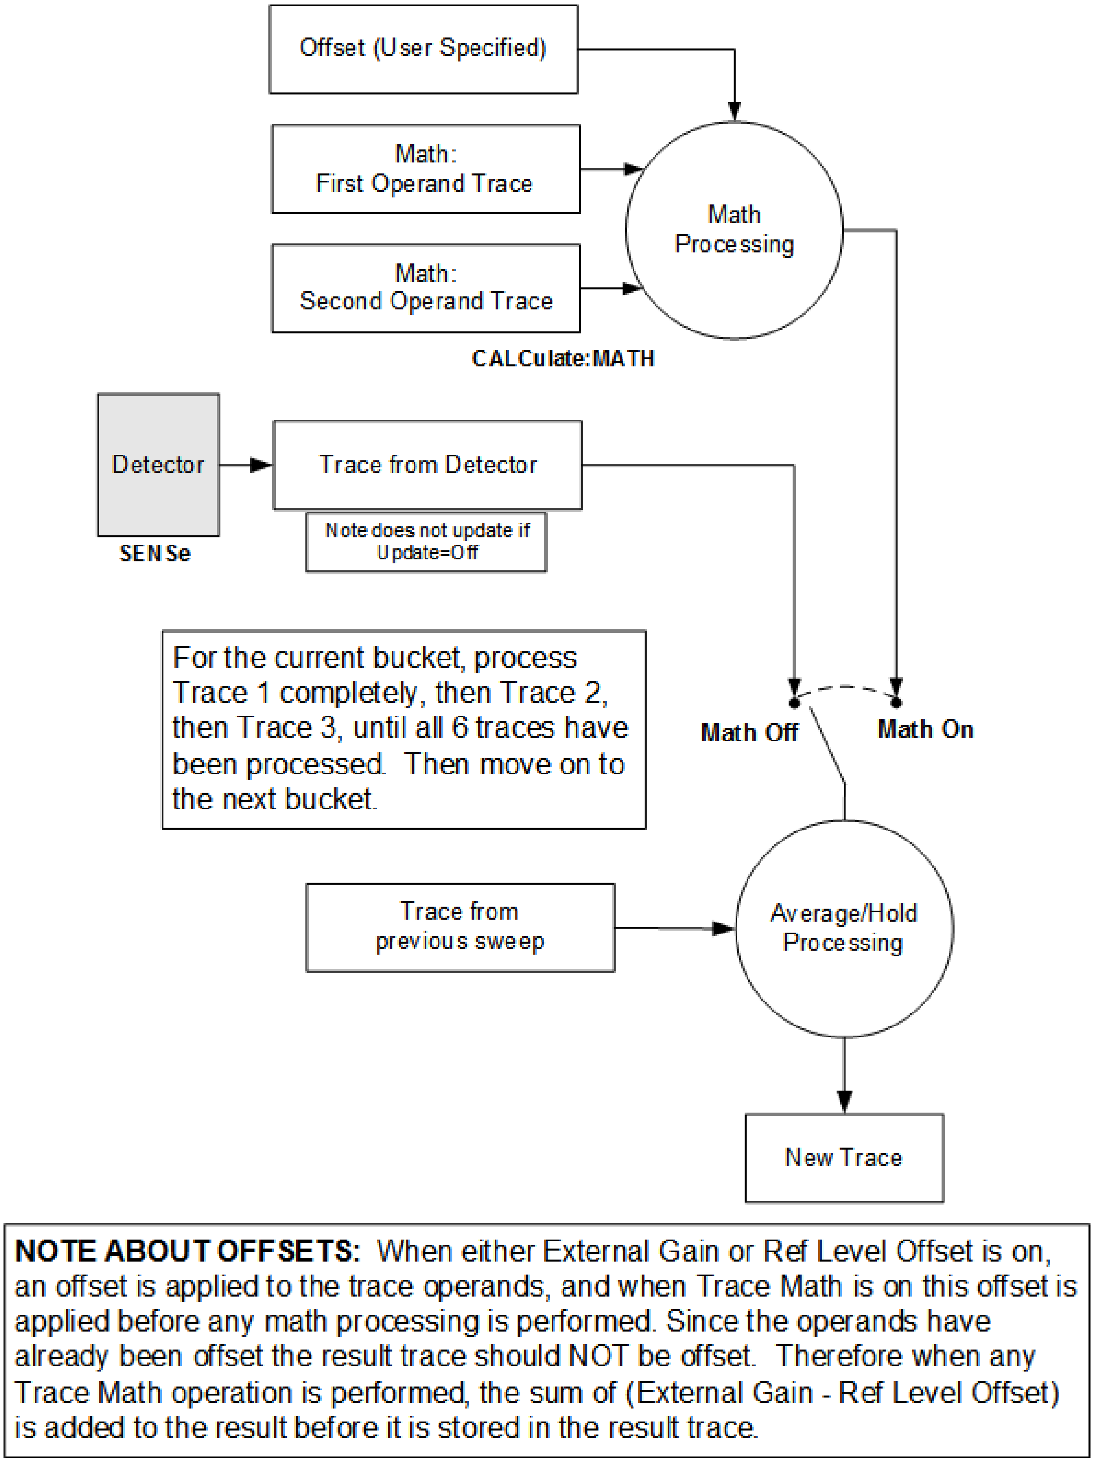
If neither of the above is true for a given point, then:

- If that point in `SecondTrace` is equal to `maxtracevalue`, the resultant point is `mintracevalue`.
- If that point in `SecondTrace` is equal to `mintracevalue`, the resultant point is `maxtracevalue`.

How trace math is processed

Whenever a trace math function is turned on, or the parameters and/or operands of an existing trace math function are changed, the destination trace is cleared. After the trace is cleared, all x-axis values in the trace, and the domain of the trace, are set to match the X-Axis settings of the first trace operand. When this is complete, a new sweep is initiated.

The process of acquiring data, processing it using the math and Average/Hold functions, and presenting it as trace data, consists of several functional blocks, as shown below:



For the current bucket, process Trace 1 completely, then Trace 2, then Trace 3, until all 6 traces have been processed. Then move on to the next bucket.

NOTE ABOUT OFFSETS: When either External Gain or Ref Level Offset is on, an offset is applied to the trace operands, and when Trace Math is on this offset is applied before any math processing is performed. Since the operands have already been offset the result trace should NOT be offset. Therefore when any Trace Math operation is performed, the sum of (External Gain - Ref Level Offset) is added to the result before it is stored in the result trace.

For each active trace, the current trace point is processed for `Trace 1`, then `Trace 2`, then `Trace 3`, etc. Trace data is taken from either the detector for that trace, or

from the mathematical result of up to two other traces and an offset, depending on whether trace math is on or not. The resultant data is then fed to the Average/Hold processing block, where (if the trace type is **Average**, **Max Hold**, or **Min Hold**) it is processed with previous trace data. The new trace data resulting from this process is then available for display, storage or remote output.

When the processing is complete for `Trace 1`, `Trace 2` is processed, and so on until all six traces have been processed. This allows a downstream trace to use as one of its math components a fully processed upstream trace. In other words, if math is `ON` for `Trace 4`, and its operand traces are `Trace 2` and `Trace 3`, then all detector, math, average and hold processing for Traces 2 and 3 is completed before the math is performed for `Trace 4`. When the current trace point is completed for all traces, the instrument moves on to the next trace point.

This allows very flexible and powerful math functions to be configured. For example, `Trace 1` can be an average trace, which can be fed with an offset to `Trace 2`, which can also be in **Max Hold**, allowing you to obtain the **Max Hold** of an Average trace.

Note that none of this processing is performed on inactive traces.

Note also that for any active trace with math `ON`, the Operand traces should have *lower* numbers than the trace (for example, using `Trace 4` as an operand for `Trace 1` will cause the data coming from `Trace 4` to be delayed by one sweep).

Operand 1 / Operand 2

These two controls select the first and second trace operands to be used for the trace math functions for the destination trace. The operands are common to all math functions for a given trace. The most recently sent `:CALCulate:MATH` command for a given trace sets the operands for that trace. Those settings are displayed on the trace operand controls for that trace.

Example	The following examples are for the Swept SA measurement
	Set Trace 3 to Power Diff trace math function. Set the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2:
	`:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0`
	Set Trace 3 to Log Offset trace math function. Set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB:
	`:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`

Notes	See "Math Function" on page 1145 for how to specify Operands 1 and 2 using `:CALCulate:MATH`
Dependencies	The destination trace cannot be an operand. The destination trace number is grayed-out on the dropdown
Preset	Operand 1: Trace number minus 2 (wraps at 1). For example, for Trace 1, Operand 1 presets to Trace

	5; for Trace 6, it presets to Trace 4 Operand 2: Trace number minus 1 (wraps at 1). For example, for Trace 1, Operand 2 presets to Trace 6; for Trace 6, it presets to Trace 5
State Saved	Operands 1 and 2 for each trace are stored in instrument state

Offset

Used by the Log Offset math function.

Example	The following example is for the Swept SA measurement Set Trace 3 to Log Offset trace math function, set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB: `:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`
State Saved	The Log Offset value for each trace is saved in Instrument State
Min	–100 dB
Max	100 dB

Reference

Used by the Log Diff math function.

Example	The following example is for the Swept SA measurement Set Trace 3 to Log Diff trace math function, set the First Trace operand (for Trace 3) to Trace 1, set the Second Trace operand (for Trace 3) to Trace 2, and set the Log Difference reference (for Trace 3) to -6 dBm: `:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00`
State Saved	The Log Difference reference value for each trace is saved in instrument state
Min/Max	Same as reference level

3.4.15.4 Detector

Lets you choose and configure detectors for the selected trace.

Detector

Selects a detector to be used by the instrument for the current measurement. Allows up to three (3) traces, but each use the same detector type choice. The following choices are available:

Option	Parameters	Description
Auto	See "Detector Select Auto/Man" on page 752	Detector selected depends on marker functions, trace functions, average type, and the trace averaging function When in `AUTO`, the detector selected is set to `AVERage`, unless the Radio Standard defaults state otherwise, for example, it is set to `POS` for Radio Standard = PDC when Device = both MS and BTS, and when Radio Standard = NADC and Device = MS
Normal	`NORMal`	Detector determines the peak of the CW-like signals, and yields alternating maximums and minimums of noise-like signals. This is also referred to as Rosenfell detection
Average	`AVERage` `RMS`	Detector determines the average of the signal within the sweep points, using RMS averaging
Peak (Positive)	`POSitive`	Detector determines the maximum of the signal within the sweep points
Sample	`SAMPle`	Detector indicates the instantaneous level of the signal at the center of the sweep points represented by each display point
Negative Peak	`NEGative`	Detector determines the minimum of the signal within the sweep points

Because they may not find a spectral component's true peak, neither Average nor Sample detectors measure amplitudes of CW signals as accurately as Peak or Normal, but they do measure noise without the biases of peak detection.

When **Meas Method** is Fast Power, Auto, Peak and Average are selectable.

Remote Command

```
[:SENSe]:ACPower:DETector[:FUNCtion] NORMal | AVERage | POSitive | SAMPle |
NEGative | RMS
[:SENSe]:ACPower:DETector[:FUNCtion]?
```

Example

```
:ACP:DET NORM
:ACP:DET?
:ACP:DET RMS
```

Sets the detector to `AVERage`. In ACP, `AVERage` uses RMS averaging, so this is equivalent to selecting an `RMS` detector

Notes

The query returns a name that corresponds to the detector type, as shown below

The `RMS` selection sets the detector type to `AVERage` with RMS averaging. Therefore, if `RMS` has been selected, the query returns `AVER`

String Returned	Definition
`NORM`	Normal
`AVER`	Average (RMS)
`POS`	Peak
`SAMP`	Sample
`NEG`	Negative Peak

Couplings	When "Detector Select Auto/Man" on page 752 is **Auto**, **Detector** switches aligning with the switch of this parameter: `NORMal` with Clear Write, `AVERage` with `AVERage`, `POSitive` (Peak) with `MAXHold`, and `NEGative` (Peak) with `MINHold` When **Detector Select Auto/Man** is **Auto**, **Detector** is set to what the Radio Standard defaults states for all conditions of Trace Type and for all traces When **Detector Select Auto/Man** is set to **Manual**, all Traces use the same detector type When Average State = Off then Trace Types `AVERage`, `MaxHold` and `MinHold` do not function, since Averaging must be 'on' for them to operate. Only one Detector type for all 3 traces is allowed When "Meas Method" on page 582 is RBW or FAST, Detector is disabled
Preset	`AVERage`
State Saved	Saved in instrument state
Range	`NORMal|AVERage|POSitive|SAMPle|NEGative|RMS`
Annotation	The four-letter mnemonic for the detector appears in the trace window next to the referenced trace
Backwards Compatibility SCPI	`[:SENSe]:ACPR:SWEep:DETector[:FUNCtion]`

Detector Select Auto/Man

Sets the Detector mode to Auto (`ON|1`) or Manual (`OFF|0`). In Auto, the proper detector is chosen based on rules that take into account the measurement settings and other instrument settings.

When you manually select any detector, this toggle is automatically set to Manual (`OFF`).

Remote Command	`[:SENSe]:ACPower:DETector:AUTO ON | OFF | 1 | 0` `[:SENSe]:ACPower:DETector:AUTO?`
Example	`:ACP:DET:AUTO 1` `:ACP:DET?`
Notes	When "Meas Method" on page 582 is Fast Power, Peak and Average are selectable
Couplings	When **Detector Select Auto/Man** is **Auto**, "Detector" on page 750 switches aligning with the switch of this parameter: `NORMal` with **Clear Write**, `AVERage` with **AVERage**, `POSitive` with `MAXHold`, and `NEGative` with `MINHold` When **Detector Select Auto/Man** is **Auto**, **Detector** is set to what the Radio Standard defaults states for all conditions of Trace Type and for all traces When **Detector Select Auto/Man** is set to **Manual**, all Traces use the same detector type When Average State = Off then Trace Types `AVERage`, `MaxHold` and `MinHold` do not function, since Averaging must be `ON` for them to operate
Preset	`ON`
State Saved	Yes

3.4.15.5 Trace Function

Contains controls to:

- Copy and Exchange traces
- Preset or Clear all traces

From Trace

Selects the trace to be copied to or exchanged with the "To Trace" on page 1153 when a "Copy" on page 1153 or "Exchange" on page 1154 is performed

Preset	1

To Trace

Selects the trace to be copied from or exchanged with the "From Trace" on page 1153 when a "Copy" on page 1153 or "Exchange" on page 1154 is performed

Preset	2

Copy

Executes a Trace Copy based on the "From Trace" on page 1153 and "To Trace" on page 1153 parameters. The copy operation is from the **From Trace** to the **To Trace**. The action is performed once.

The X-Axis settings and domain of a trace are also copied.

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe:COPY TRACE1 | … | TRACE6, TRACE1 | … | TRACE6`
	For all other measurements:
	`:TRACe:<meas>:COPY TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
	where `<meas>` is the identifier for the current measurement
	Note that the format of the `TRACe<n>` parameter differs from that for the Swept SA Measurement

Example	Copy Trace 1 to Trace 3 and put Trace 3 in Update=Off, Display=On `:TRAC:COPY TRACE1,TRACE3`
Notes	The command is of the form: `:TRACe:COPY <source_trace>,<dest_trace>`
Dependencies	When Signal ID is on, this key is grayed-out

Couplings	The destination trace is put in **View** (Update = Off, Display = On) after the copy

Preset	For Swept SA Measurement (in SA Mode):
	`TRACE1, TRACE2`
	For all other measurements:
	`TRACe1, TRACe2`

Exchange

Executes a Trace Exchange based on the "From Trace" on page 1153 and "To Trace" on page 1153 parameters. The **From Trace** and **To Trace** values are exchanged with each other. The action is performed once.

The X-Axis settings and domain of a trace are also copied when it is exchanged with another trace.

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe:EXCHange TRACE1 | … | TRACE6, TRACE1 | … | TRACE6`
	For all other measurements:
	`:TRACe:<meas>:EXCHange TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
	where `<meas>` is the identifier for the current measurement
	Note that the format of the `:TRACe<n>` parameter differs from that for the Swept SA Measurement

Example	Exchange Trace 1 and Trace 2 and put both traces in Update=`OFF`, Display=`ON`: `:TRAC:EXCH TRACE1,TRACE2`
Notes	The command is of the form: `:TRACe:EXCHange <trace_1>,<trace_2>`
Couplings	Both traces are put in **View** (Update=Off, Display=On) after the exchange

Preset All Traces

Turns on Trace 1 and blanks all other traces. This is useful when you have many traces on and you want to return to having only Trace 1 on the display. Does not affect the trace type, detector or any other aspect of the trace system.

Remote Command	`:TRACe[:<meas>]:PRESet:ALL`
Example	`:TRAC:PRES:ALL`
Dependencies	When Signal ID is on, this key is grayed-out

Clear All Traces

Clears all traces. Does not affect the state of any function or variable in the instrument. Loads `mintracevalue` into all of the points for all traces, except traces in **Min Hold**, in which case it loads `maxtracevalue`, even if **Update** = `OFF`.

Remote Command	`:TRACe[:<meas>]:CLEar:ALL`
Example	`:TRAC:CLE:ALL`
Dependencies	When Signal ID is on, this key is grayed-out

3.4.15.6 Advanced

Contains controls for setting advanced trace functions of the instrument.

Measure Trace

Specifies which trace's scalar results are displayed in the **Metrics** window, and retrieved by sending a `:READ` or `:FETCh` query:

- Trace 1
- Trace 2
- Trace 3

Remote Command	`:CALCulate:<meas>:MTRace TRACe1 | TRACe2 | TRACe3`
	`:CALCulate:<meas>:MTRace?`
	`<meas>` is the identifier for the current measurement; any one of `CHPower | ACPower | OBWidth | SEMask | SPURious | PVTime`

Example	Channel Power
	`:CALC:CHP:MTR TRAC1`
	`:CALC:CHP:MTR?`

Dependencies	In the ACP measurement, this control is grayed-out when **Meas Method** is set to `RBW` or `FAST`, and only Trace 1 is enabled
Preset	`TRACe1`
State Saved	No
Range	Trace 1 | Trace 2 | Trace 3

3.5 SEM Measurement

The Spectrum Emission Mask measurement analyzes spurious signal levels in up to six pairs of offset frequencies and relates them to the carrier power.

SEM Measurement Commands

The following commands and queries can be used to configure the measurement, then retrieve measurement results:

The general functionality of "CONFigure" on page 2997, "INITiate" on page 2998, "FETCh" on page 2998, "MEASure" on page 3000, and "READ" on page 2999 are described in the section **SCPI Operation and Results Query** in the topic **Programming the Instrument**.

Note that, in general, `:CONF:<measurement>` resets the specified measurement settings to their defaults. X-Series permits the addition of the `NDEFault` node to the command, which prevents a measurement preset after a measurement switch.

```
:CONFigure:SEMask
```

```
:CONFigure:SEMask:NDEFault
```

```
:INITiate:SEMask
```

```
:FETCh:SEMask[n]?
```

```
:MEASure:SEMask[n]?
```

```
:READ:SEMask[n]?
```

Remote Command Results Overview

The following table provides an overview of the results returned by the `:FETCh`, `:MEASure`, and `:READ` queries listed above, according to the index value `n`. For Mode-specific details, click on the appropriate link for each `n` value.

Offsets that are turned off (inactive) return -999.0 or `NAN` when their results are queried via SCPI. The value of `NAN` is 9.91E+37.

n	Results
1	Result summary (Offsets A - F) Note that n = 1 returns results of 6 offsets (Offset A to F) See "Results for n = 1" on page 758
2	Displayed frequency domain spectrum trace data for Trace 1 See "Results for n = 2-4" on page 761
3	Displayed frequency domain absolute limit trace data See "Results for n = 2-4" on page 761
4	Displayed frequency domain relative limit trace data

n	Results
	See "Results for n = 2-4" on page 761
5	Offset abs power, Offset abs PSD, Offset abs peak power depending on "Measurement Type" on page 929 (Offset A- L) See "Results for n = 5" on page 761
6	Offset rel power, Offset rel PSD, Offset rel peak power depending on "Measurement Type" on page 929 (Offset A- L) See "Results for n = 6" on page 764
7, 8	Offset pass/fail (Offset A- L) See "Results for n = 7-11" on page 765
9	Offset peak power freq (Offset A- L) See "Results for n = 7-11" on page 765
10	Offset abs peak power (Offset A- L) See "Results for n = 7-11" on page 765
11	Offset rel peak power (Offset A- L) See "Results for n = 7-11" on page 765
12	Peak power of the signal in the ref channel when "Measurement Type" on page 929 is Spectrum Peak Reference See "Results for n = 12" on page 767
13	Ref channel summary Available only in LTEAFDD, LTEATDD, MSR and 5GNR Modes See "Results for n = 13" on page 767
14	Offset result summary (Offset A- L) See "Results for n = 14" on page 769
15	Offset limit margins (Offset A- L) See "Results for n = 15" on page 770
16	Carrier powers Available only in LTEAFDD, LTEATDD, MSR, 5GNR, and WLAN Modes See "Results for n = 16" on page 771
17	Displayed frequency domain combined limit trace data Available only in LTEAFDD, LTEATDD, MSR and 5GNR Modes See "Results for n = 17" on page 771
18	Displayed frequency domain spectrum trace data for Trace 2 See "Results for n = 18-20" on page 771
19	Displayed frequency domain spectrum trace data for Trace 3 See "Results for n = 18-20" on page 771
20	Displayed frequency domain absolute 2 limit trace data See "Results for n = 18-20" on page 771
21	Result Summary (Offset A – L, Outer and Inner)

n	Results
	Available only in LTEAFDD, LTEATDD, and 5GNR Modes See "Results for n = 21" on page 771
22	Offset pass/fail (Offset A- L) Available only in LTEAFDD, LTEATDD, and 5GNR Modes See "Results for n = 22" on page 777

3.5.1 Results for n = 1

Returns outer offset results when "Non-Contiguous Meas Region" on page 850 is set to **Outer** or **Outer & Inner** (5GNR, LTEAFDD, LTEATDD only), and returns inner offset results when it is set to **Inner**, in the following order:

Available Power Ref selections differ depending on the mode. For details, see "Power Ref" on page 930

k is an index for each offset: k = 0 for offset A; k = 1 for offset B; k = 2 for offset C, etc. The number of offsets is 6 (A-F).

82 2k + 72, k = 5	Minimum margin from limit line on the positive offset F	dB

*1: Absolute power when "Measurement Type" on page 929 is Total Power Ref or PSD Ref; Peak power when "Measurement Type" on page 929 is Spectrum Peak Ref

*2: Integrated power when "Measurement Type" on page 929 is Total Power Ref or PSD Ref; Peak power when "Measurement Type" on page 929 is Spectrum Peak Ref

3.5.2 Results for n = 2-4

n	Data
2	Returns the displayed frequency domain spectrum trace data for Trace 1 separated by commas
3	Returns the displayed frequency domain absolute limit trace data separated by commas
4	Returns the displayed frequency domain relative limit trace data separated by commas

3.5.3 Results for n = 5

The results returned depend on "Measurement Type" on page 929:

- "Total Power Reference" on page 761
- "Power Spectral Density Reference" on page 762
- "Spectrum Peak Reference" on page 763

Total Power Reference

Returns comma-separated scalar values (in dBm) of the absolute integrated power of the segment frequencies. The length of the result depends on the number of available offset (See "Number of Offsets" on page 777)

#	Item	Unit
1	Total power reference	dBm
2	Reserved for future use, returns -999.0	
3	Absolute integrated power at negative offset frequency A	
4	Absolute integrated power at positive offset frequency A	

25	Absolute integrated power at negative offset frequency L	
26	Absolute integrated power at positive offset frequency L	

For MSR, 5G NR, LTEAFDD, and LTEATDD modes, returns outer offset results when "Non-Contiguous Meas Region" on page 850 is set to **Outer**, and returns inner offset results when it is set to **Inner**, in the following order

For LTEAFDD, LTEATDD, 5G NR, and MSR Modes, available Power Ref selections differ depending on the mode. For details, see "Power Ref" on page 930

#	Item	Unit
1	Reference power	dBm

<table>
<tr><th>#</th><th>Item</th><th>Unit</th></tr>
<tr><td></td><td><table>
<tr><th>Power Ref</th><th>Result</th></tr>
<tr><td>Left & Right Carriers</td><td>Left ref carrier power</td></tr>
<tr><td>Max Power Carrier in Sub-block</td><td>Ref carrier power of the left sub-block</td></tr>
<tr><td>Left & Right Sub-blocks</td><td>Integrated power in the left sub-block</td></tr>
</table></td><td></td></tr>
<tr><td>2</td><td>Right reference power</td><td>dBm</td></tr>
<tr><td></td><td><table>
<tr><th>Power Ref</th><th>Result</th></tr>
<tr><td>Left & Right Carriers</td><td>Right ref carrier power</td></tr>
<tr><td>Max Power Carrier in Sub-block</td><td>Ref carrier power of the right sub-block</td></tr>
<tr><td>Left & Right Sub-blocks</td><td>Integrated power in the right sub-block</td></tr>

<tr><td></td><td>---</td><td></td></tr>
<tr><td>25</td><td>Absolute integrated power at negative offset frequency L</td><td></td></tr>
<tr><td>26</td><td>Absolute integrated power at positive offset frequency L</td><td></td></tr>
</table>

Power Spectral Density Reference

Returns comma-separated scalar values (in dBm/Hz) of the absolute integrated power of the segment frequencies. The length of the result depends on the number of available offset (See "Number of Offsets" on page 777)

#	Item	Unit
1	Power spectral density reference	dBm/Hz
2	Reserved for future use, returns -999.0	
3	Absolute integrated power at negative offset frequency A	
4	Absolute integrated power at positive offset frequency A	

25	Absolute integrated power at negative offset frequency L	
26	Absolute integrated power at positive offset frequency L	

For MSR, 5G NR, LTEAFDD, and LTEATDD modes, returns outer offset results when "Non-Contiguous Meas Region" on page 850 is set to **Outer**, and returns inner offset results when it is set to **Inner**, in the following order

For LTEAFDD, LTEATDD, 5G NR, and MSR Modes, available Power Ref selections differ depending on the mode. For details, see "Power Ref" on page 930

#	Item	Unit
1	Reference power	dBm/Hz

Power Ref	Result
Left & Right Carriers	Left ref carrier power
Max Power Carrier in Sub-block	Ref carrier power of the left sub-block
Left & Right Sub-blocks	Integrated power in the left sub-block

#	Item	Unit
2	Right reference power	dBm

Power Ref	Result
Left & Right Carriers	Right ref carrier power
Max Power Carrier in Sub-block	Ref carrier power of the right sub-block
Left & Right Sub-blocks	Integrated power in the right sub-block
All others	999.0

#	Item	Unit
3	Absolute integrated power at negative offset frequency A	
4	Absolute integrated power at positive offset frequency A	

25	Absolute integrated power at negative offset frequency L	
26	Absolute integrated power at positive offset frequency L	

Spectrum Peak Reference

Returns comma-separated scalar values (in dBm) of the absolute peak power of the segment frequencies. The length of the result depends on the number of available offset (See "Number of Offsets" on page 777)

#	Item	Unit
1	Spectrum Peak Power reference	dBm
2	Reserved for future use, returns -999.0	
3	Absolute peak power at negative offset frequency A	
4	Absolute peak power at positive offset frequency A	

25	Absolute peak power at negative offset frequency L	
26	Absolute peak power at positive offset frequency L	

For MSR, 5G NR, LTEAFDD, and LTEATDD modes, returns outer offset results when "Non-Contiguous Meas Region" on page 850 is set to **Outer**, and returns inner offset results when it is set to **Inner**, in the following order

For LTEAFDD, LTEATDD, 5G NR, and MSR Modes, available Power Ref selections differ depending on the mode. For details, see "Power Ref" on page 930

#	Item		Unit
1	Spectrum Peak Power reference		dBm
	Power Ref	**Result**	
	Left & Right Carriers	Spectrum Peak Power reference at the left reference carrier	
	Max Power Carrier in Sub-block	Spectrum Peak Power reference of the left sub-block	
	Left & Right Sub-blocks	Spectrum Peak Power reference in the left sub-block	
2	Spectrum Peak Power reference		dBm
	Power Ref	**Result**	
	Left & Right Carriers	Spectrum Peak Power reference at the right reference carrier	
	Max Power Carrier in Sub-block	Spectrum Peak Power reference of the right sub-block	
	Left & Right Sub-blocks	Spectrum Peak Power reference in the right sub-block	
	All others	-999.0	
3	Absolute peak power at negative offset frequency A		
4	Absolute peak power at positive offset frequency A		

25	Absolute peak power at negative offset frequency L		
26	Absolute peak power at positive offset frequency L		

3.5.4 Results for n = 6

When "Measurement Type" on page 929 is Total Power Ref or PSD Ref, returns comma-separated scalar values (in dBc or dBc/Hz) of the integrated power relative to the carrier at the segment frequencies

When "Measurement Type" on page 929 is Spectrum Peak Ref, returns comma-separated scalar values (in dB) of the peak power relative to the carrier at the segment frequencies

The length of the result depends on the number of available offset (See "Number of Offsets" on page 777)

For MSR, 5G NR, LTEAFDD, and LTEATDD Modes, returns outer offset results when "Non-Contiguous Meas Region" on page 850 is set to **Outer** or **Outer & Inner** (5GNR, LTEAFDD, LTEATDD only), and returns inner offset results when it is set to **Inner**

The results are in the following order:

k is an index for each offset: k = 0 for offset A; k = 1 for offset B; k = 2 for offset C, etc. The number of offsets is 12 (A-L).

#	Item
1	Reserved for future use, returns -999.0
2	Reserved for future use, returns -999.0
3	Power$^{(*1)}$ at negative offset A
2k + 3, k = 0	
4	Power$^{(*1)}$ at positive offset A
2k + 4, k = 0	

26	Power$^{(*1)}$ at positive offset L
2k + 4, k = 11	

*1: Relative integrated power when "Measurement Type" on page 929 is Total Power Ref or PSD Ref; Relative peak power when "Measurement Type" on page 929 is Spectrum Peak Ref

3.5.5 Results for n = 7-11

<table>
<tr><th>n</th><th>Data</th></tr>
<tr><td>7, 8</td><td>
Returns comma-separated pass/fail test results (0 = passed, or 1 = failed) determined by testing the minimum margin point from the limit line that is determined each offset's Limits setting. The length of the result depends on the number of available offset (See "Number of Offsets" on page 777)
For MSR, 5G NR, LTEAFDD, and LTEATDD Modes, returns outer offset results when "Non-Contiguous Meas Region" on page 850 is set to **Outer** or **Outer & Inner** (5GNR, LTEAFDD, LTEATDD only), and returns inner offset results when it is set to **Inner**
The results are in the following order:
<table>
<tr><th>#</th><th>Item</th></tr>

3.5.6 Results for n = 12

When "Measurement Type" on page 929 is Spectrum Peak reference, returns the peak power of the signal in the ref channel

Otherwise, the value returned is -999.0

3.5.7 Results for n = 13

Returns outer offset results when "Non-Contiguous Meas Region" on page 850 is set to **Outer** or **Outer & Inner** (5GNR, LTEAFDD, LTEATDD only), and returns inner offset results when it is set to **Inner**, in the following order:

#	Item		Unit
1	**Power Ref**	**Result**	dBm
	Max Power Carrier Max Power Carrier in Sub-block RF Bandwidth	Total Absolute power of carriers of Measure Carrier On	
	All others	NaN	
2	Absolute reference power		When "Measurement Type" on page 929 is PSD Ref: dBm/Hz Others: dBm
	Power Ref	**Result**	
	Left & Right Carriers	Power$^{(*1)}$ at the left reference carrier

#	Item	Unit
	Power Ref / **Result** Sub-blocks: reference sub-block frequency range All others: NaN	

*1: Absolute power when "Measurement Type" on page 929 is Total Power Ref or PSD Ref; Peak power when "Measurement Type" on page 929 is Spectrum Peak Ref

*2: Integrated power when "Measurement Type" on page 929 is Total Power Ref or PSD Ref; Peak power when "Measurement Type" on page 929 is Spectrum Peak Ref

If the result is not available, NaN (9.91E+37) is returned

The number of values returned is subject to change in future releases

3.5.8 Results for n = 14

Returns comma-separated scalar results

For MSR, 5G NR, LTEAFDD, and LTEATDD Modes, returns outer offset results when "Non-Contiguous Meas Region" on page 850 is set to **Outer** or **Outer & Inner** (5GNR, LTEAFDD, LTEATDD only), and returns inner offset results when it is set to **Inner**

The results are in the following order:

k is an index for each offset: k = 0 for offset A; k = 1 for offset B; k = 2 for offset C, etc. The number of offsets is 12 (A-L)

#	Item	Unit
1 10k + 1, k = 0	Relative integrated power on the negative offset A Returns NaN when "Measurement Type" on page 929 is Spectrum Peak Ref	When "Measurement Type" on page 929 is Total Power Ref: dBc When PSD: dB
2 10k + 2, k = 0	Absolute integrated power on the negative offset A Returns NaN when "Measurement Type" on page 929 is Spectrum Peak Ref	When "Measurement Type" on page 929 is Total Power Ref: dBm When PSD: dBm/Hz
3 10k + 3, k = 0	Relative peak power on the negative offset A	When "Measurement Type" on page 929 is Total Power Ref PSD: dBc Others: dB
4 10k + 4, k = 0	Absolute peak power on the negative offset A	When "Measurement Type" on page 929 is PSD Ref: dBm/Hz Others: dBm
5 10k + 5, k = 0	Peak power offset frequency from the center or carrier edge frequency in the negative offset A Depends on the setting of "Offset Freq Define" on page 870	Hz

#	Item	Unit
6 10k + 6, k = 0	Relative integrated power on the positive offset A Returns NaN when "Measurement Type" on page 929 is Spectrum Peak Ref	When "Measurement Type" on page 929 is Total Power Ref: dBc When PSD: dB
7 10k + 7, k = 0	Absolute integrated power on the positive offset A Returns NaN when "Measurement Type" on page 929 is Spectrum Peak Ref	When "Measurement Type" on page 929 is Total Power Ref: dBm When PSD: dBm/Hz
8 10k + 8, k = 0	Relative peak power on the positive offset A	When "Measurement Type" on page 929 is Total Power Ref: dBc Others: dB
9 10k + 9, k = 0	Absolute peak power on the positive offset A	When "Measurement Type" on page 929 is PSD Ref: dBm/Hz Others: dBm
10 10k + 10, k = 0	Peak power offset frequency from the center or carrier edge frequency in the positive offset A Depends on the setting of "Offset Freq Define" on page 870	Hz
---		
120 10k + 10, k = 11	Peak power offset frequency from the center or carrier edge frequency in the positive offset L Depends on the setting of "Offset Freq Define" on page 870	Hz

If the result is not available, NaN (9.91E+37) is returned

3.5.9 Results for n = 15

Results available only when "Measurement Type" on page 929 is Total Power Reference.

Returns comma-separated scalar results

For MSR, 5G NR, LTEAFDD, and LTEATDD Modes, returns outer offset results when "Non-Contiguous Meas Region" on page 850 is set to **Outer** or **Outer & Inner** (5GNR, LTEAFDD, LTEATDD only), and returns inner offset results when it is set to **Inner**

The results are in the following order:

k is an index for each offset: k = 0 for offset A; k = 1 for offset B; k = 2 for offset C, etc. The number of offsets is 12 (A-L).

#	Item	Unit
1 2k + 1, k = 0	Minimum margin from limit line on the negative offset A	dB
2 2k + 2, k = 0	Minimum margin from limit line on the positive offset A	dB

#	Item	Unit
3 2k + 1, k = 1	Minimum margin from limit line on the negative offset B	dB
4 2k + 2, k = 1	Minimum margin from limit line on the positive offset B	dB
---		
24 2k + 2, k = 11	Minimum margin from limit line on the positive offset L	dB

3.5.10 Results for n = 16

Returns number of carriers comma-separated scalar results, in the following order:

#	Item	Unit
1	Absolute power of carrier 1	dBm
2	Absolute power of carrier 2	dBm
	---	
number of carriers - 1	Absolute power of carrier (number of carriers) - 1	dBm
number of carriers	Absolute power of carrier (number of carriers)	dBm

If Measure Carrier of the corresponding carrier is no, `NaN` (9.91E+37) is returned

If the result is not available, `NaN` (9.91E+37) is returned

3.5.11 Results for n = 17

Returns the displayed frequency domain combined limit trace data separated by comma. Combined trace is a mixed trace of both absolute limit trace and relative limit trace according to the fail mask condition

3.5.12 Results for n = 18-20

n	Return Value
18	Returns the displayed frequency domain spectrum trace data for Trace 2 separated by commas
19	Returns the displayed frequency domain spectrum trace data for Trace 3 separated by commas
20	Returns the displayed frequency domain absolute 2 limit trace data, separated by commas

3.5.13 Results for n = 21

The results consist of seven categories:

- 1-10 (outer reference powers)
- 11-130 (outer offset results)
- 131-154 (outer minimum margins)
- 155-170 (reserved)
- 171-180 (inner reference powers)
- 181-300 (inner offset results)
- 301-324 (inner minimum margins)

"Non-Contiguous Meas Region" on page 850	Results returned
Outer	Outer offset results. For items returning an inner offset result, returns NaN
Inner	Inner offset results. For items returning an outer offset result, returns NaN
Outer & Inner	Both outer and inner offset results

Available Power Ref selections differ depending on the mode. For details, see "Power Ref" on page 930

Below, k is an index for each offset: k = 0 for offset A; k = 1 for offset B; k = 2 for offset C, etc. For these Modes, the number of offsets is always 12 (A-L).

*2: Integrated power when "Measurement Type" on page 929 is Total Power Ref or PSD Ref; Peak Power when "Measurement Type" on page 929 is Spectrum Peak Ref

3.5.14 Results for n = 22

Returns comma-separated pass/fail test results (0 = passed, or 1 = failed) determined by testing the minimum margin point from the limit line that is determined each offset's Limits setting.

"Non-Contiguous Meas Region" on page 850	Results returned
Outer	Outer offset results. For items returning an inner offset result, returns NaN
Inner	Inner offset results. For items returning an outer offset result, returns NaN
Outer & Inner	Both outer and inner offset results

Below, k is an index for each offset: k = 0 for offset A; k = 1 for offset B; k = 2 for offset C, etc. For these Modes, the number of offsets is always 12 (A-L).

#	Item
1	Reserved for future use, returns NaN
2	Reserved for future use, returns NaN
3 2k + 3, k = 0	At negative offset A for outer
4 2k + 4, k = 0	At positive offset A for outer
---	
26 2k + 4, k = 11	At positive offset L for outer
27~32	Reserved for future use, returns NaN
33 2k + 33, k = 0	At negative offset A for inner
34 2k + 34, k = 0	At positive offset A for inner
---	
56 2k + 34, k = 11	At positive offset L for inner

3.5.15 Number of Offsets

The number of available offsets varies depending on the mode and option as below.

Mode	Number of available offsets
MSR LTEAFDD, LTEATDD, 5G NR	12 (Offset A to L)
WLAN	14 (Offset A to N)
Other Modes with option: N9060A-7FP, N9060B-2FP, N9060C-2FP, N9060EM1D, N9060EM1E, or N90EMPSMB	12 (Offset A to L)
Other Modes without option N9060A-7FP, N9060B-2FP, N9060C-2FP, N9060EM1D, N9060EM1E, or N90EMPSMB	6 (Offset A to F)

3.5.16 Views

All Modes provide three predefined views. In MSR, LTE-Advanced FDD/TDD and 5G NR Modes, there is also a fourth predefined view. The views are listed in the table below.

In the following table:

- The Enumerated ID is used with `:DISP:SEM:VIEW`
- The Numeric ID is used with `:DISP:SEM:VIEW:NSEL`

View Name	Enumerated ID	Numeric ID	Details
"Abs Pwr Freq" on page 779	`APFReq`	1	Displays the absolute power levels in dBm and the corresponding frequencies in the text window
"Rel Pwr Freq" on page 779	`RPFReq`	2	Displays the relative power levels in dBc and the corresponding frequencies in the text window
"Integrated Power" on page 780	`IPOWer`	3	Displays the absolute and relative power levels integrated throughout the bandwidths between the start and stop frequencies in the text window
"Carrier Info" on page 780	`CINFormation`	4	Displays the carrier info table Only available in MSR, LTE-Advanced FDD/TDD and 5G NR Modes MSR is not supported in UXM

View Selection by Name

Remote Command	`:DISPlay:SEMask:VIEW[:SELect] APFReq | RPFReq | IPOWer | CINFormation` `:DISPlay:SEMask:VIEW[:SELect]?`
Example	`:DISP:SEM:VIEW IPOW`

	`:DISP:SEM:VIEW?`
Dependencies	In SA Mode, when **Radio Standard** is set to WLAN, `IPOWer` is not available `CINFormation` is available only in MSR, LTE-Advanced FDD/TDD and 5G NR Modes
Preset	`APFReq` unless noted below `RPFReq` WLAN
State Saved	Saved in instrument state
Range	Abs Pwr Freq| Rel Pwr Freq|Integrated Power|Carrier Info

Views Selection by Number

Remote Command	`:DISPlay:SEMask:VIEW:NSELect <integer>` `:DISPlay:SEMask:VIEW:NSELect?`
Example	`:DISP:SEM:VIEW:NSEL 2` `:DISP:SEM:VIEW:NSEL?`
Dependencies	In SA Mode, when **Radio Standard** is set to WLAN, Option 3 is not available Option 4 is available only in MSR, LTE-Advanced FDD/TDD and 5G NR Modes
Preset	1 unless noted below: 2 WLAN
State Saved	Saved in instrument state
Min/Max	MSR, LTEAFDD, LTEATDD, 5G NR Modes: 1/4 All other Modes: 1/3

3.5.16.1 Abs Pwr Freq

Displays the absolute power levels in dBm and the corresponding frequencies in the text window.

Windows: "Graph" on page 780, "Table" on page 785

Example	`:DISP:SEM:VIEW APFR`

3.5.16.2 Rel Pwr Freq

Displays the relative power levels in dBc and the corresponding frequencies in the text window.

Windows: "Graph" on page 780, "Table" on page 785

Example	`:DISP:SEM:VIEW RPFR`

3.5.16.3 Integrated Power

Displays the absolute and relative power levels integrated throughout the bandwidths between the start and stop frequencies in the text window.

Windows: "Graph" on page 780, "Table" on page 785

Example	`:DISP:SEM:VIEW IPOW`

3.5.16.4 Carrier Info

Only available in MSR, LTE-Advanced and 5G NR Modes.

Displays the carrier configuration information with measure powers. Sets the display to the **Carrier Info** view. The lower window is the carrier info table in this view.

Windows: "Graph" on page 780, "Table" on page 785

Example	`:DISP:SEM:VIEW CINF`
Dependencies	Only available in MSR, LTE-Advanced FDD/TDD and 5G NR Modes

3.5.17 Windows

There are four available window types:

- In all Modes, the "Graph" on page 780 and "Table" on page 785 windows are available
- In the MSR, LTE-Advanced FDD/TDD and 5G NR Modes, an additional window, **Carrier Info**, is available. For details, see the **View** topic for "Carrier Info" on page 780
- When **Gate View** is on, the "Gate" on page 795 window is available

This section describes the windows.

3.5.17.1 Graph

Used to display the spectrum being measured by the SEM measurement.

This window appears in several Views, as follows:

View	Size	Position
Abs Pwr Freq	Three fifth, full width	Top

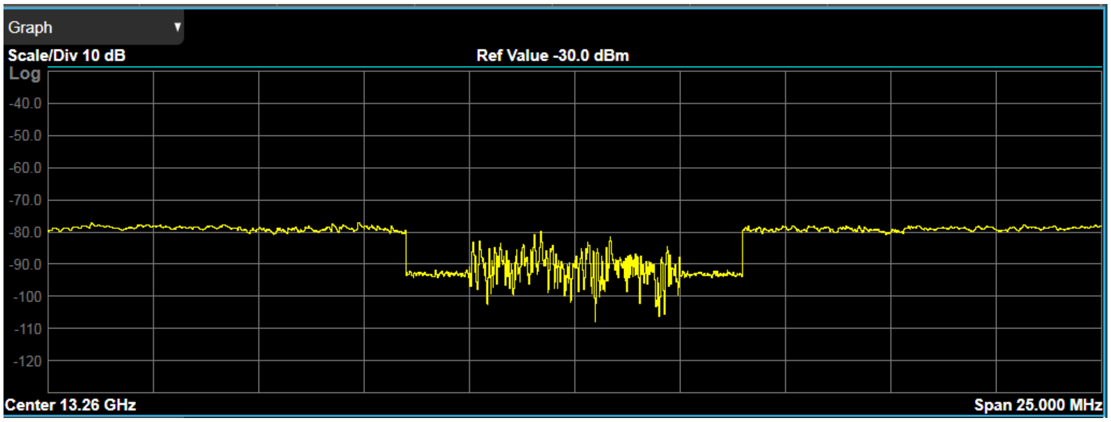
View	Size	Position
Rel Pwr Freq	Three fifth, full width	Top
Integrated Power	Three fifth, full width	Top
Gate View	One third, full width	Middle

The Graph differs depending on which View you are in. The views differ depending on the setting of the measurement type ("Measurement Type" on page 929) under the **Meas Setup** menu

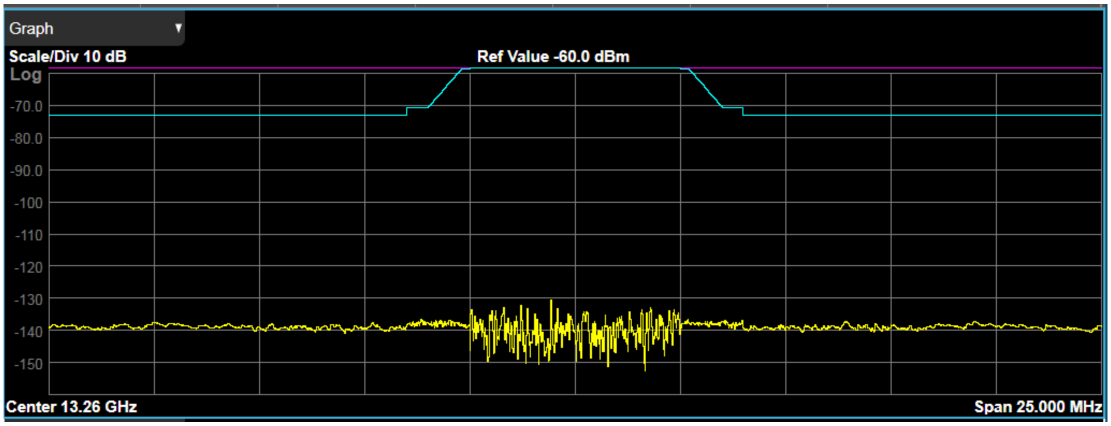
Graph Window in Abs Pwr Freq View

Corresponding Trace	yellow - Combined trace from carrier and each offset

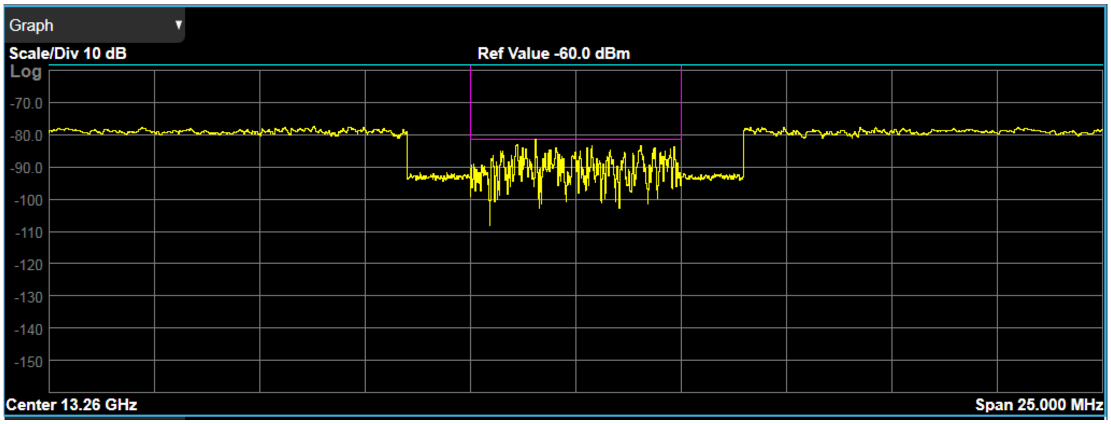
Abs Peak Pwr & Freq (Total Pwr Ref)



Abs Peak Pwr & Freq (PSD Ref)



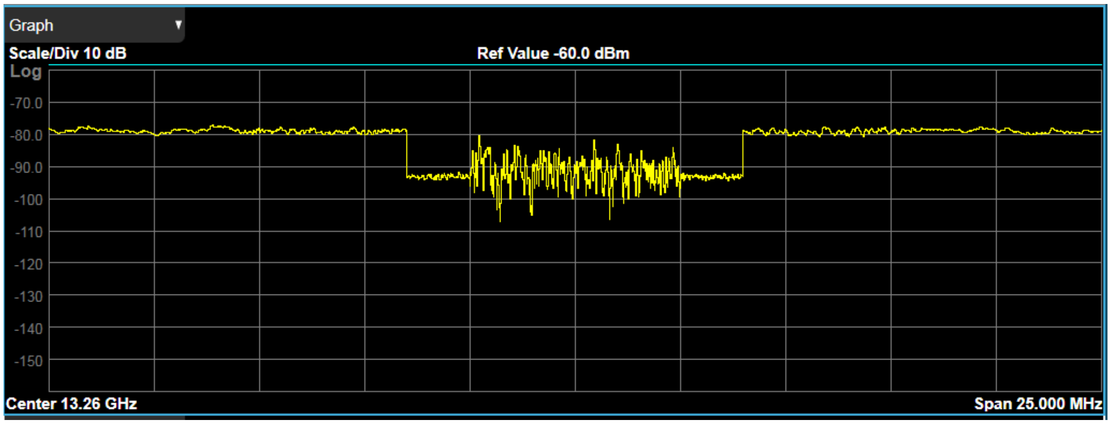
Abs Peak Pwr & Freq (Spectrum Pk Ref)



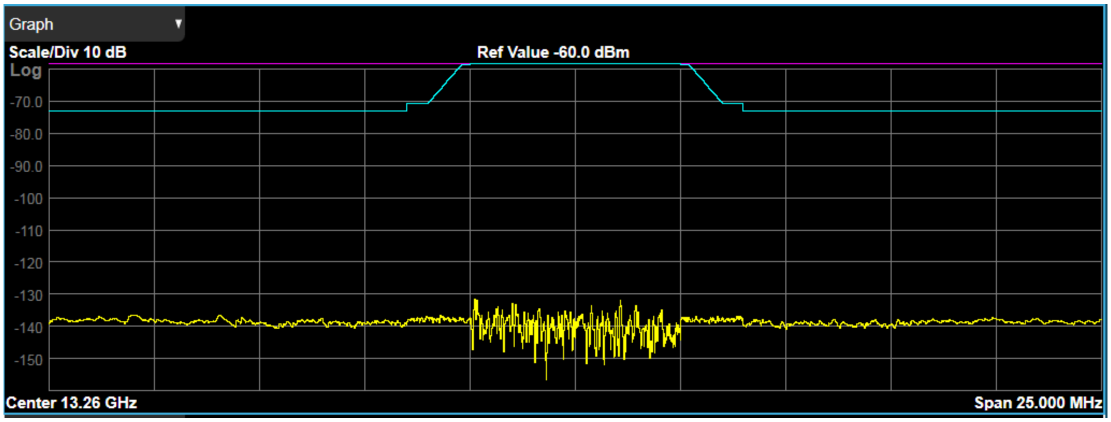
Graph Window in Rel Pwr Freq View

Corresponding Trace	yellow - Combined trace from carrier and each offset

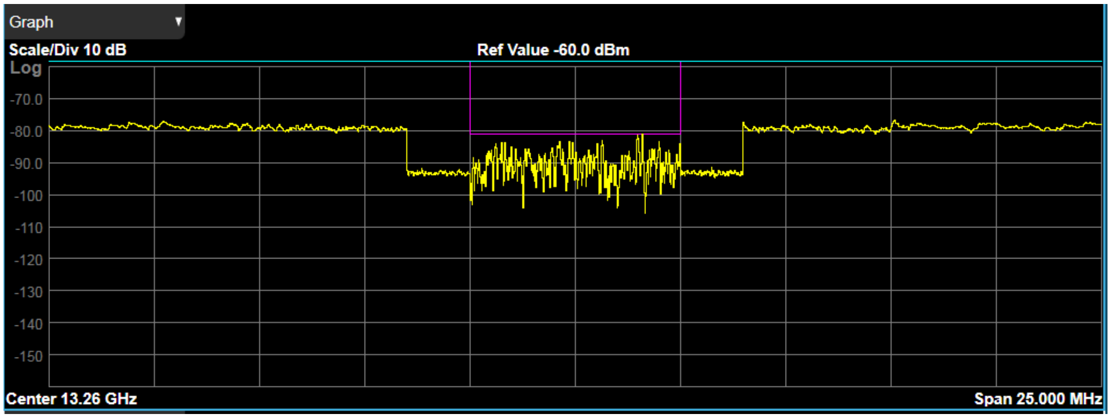
Rel Peak Pwr & Freq (Total Pwr Ref)



Rel Peak Pwr & Freq (PSD Ref)



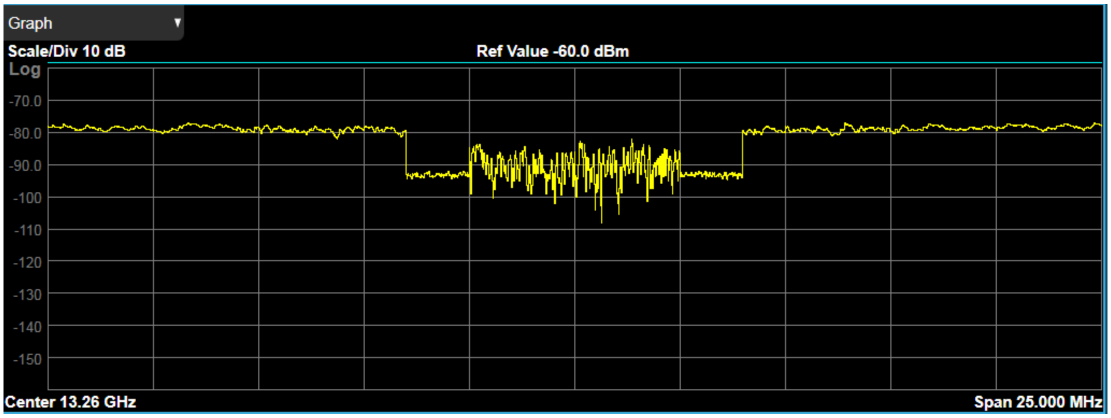
Rel Peak Pwr & Freq (Spectrum Pk Ref)



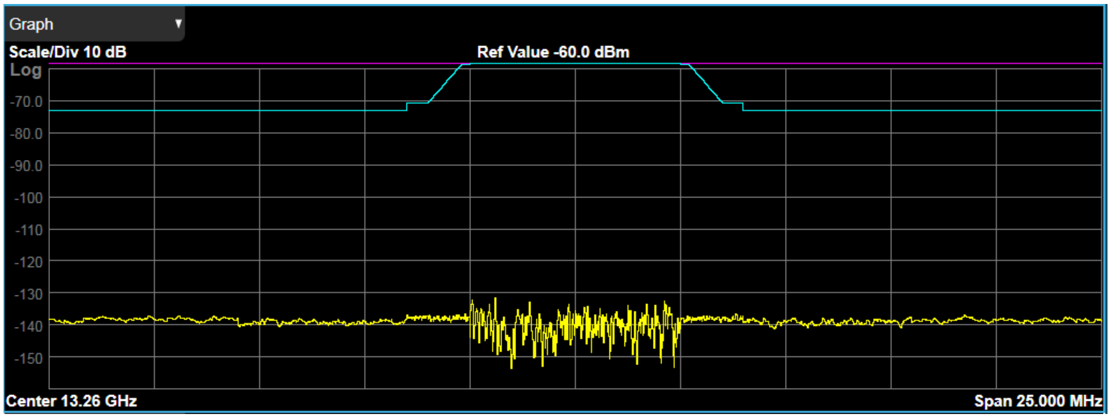
Graph Window in Integrated Power View

Corresponding Trace	yellow - Combined trace from carrier and each offset

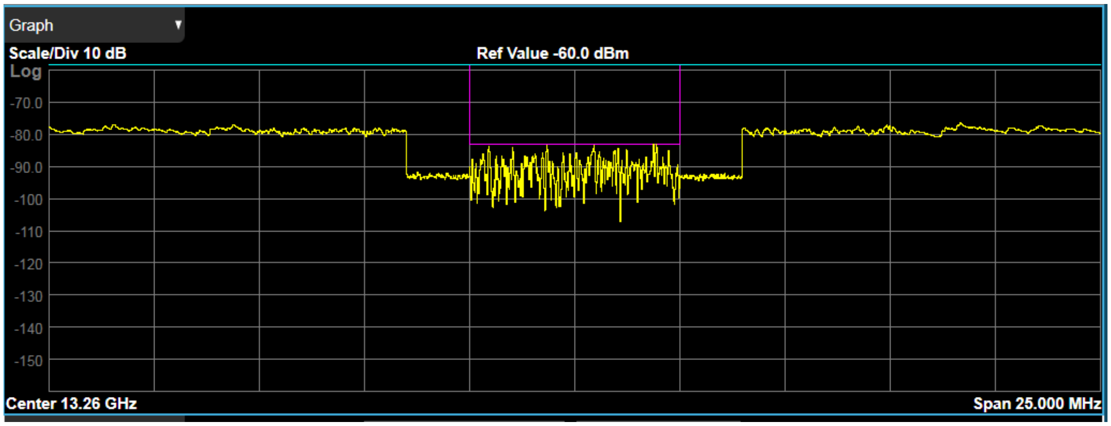
Integrated Power (Total Pwr Ref)



Integrated Power (PSD Ref)



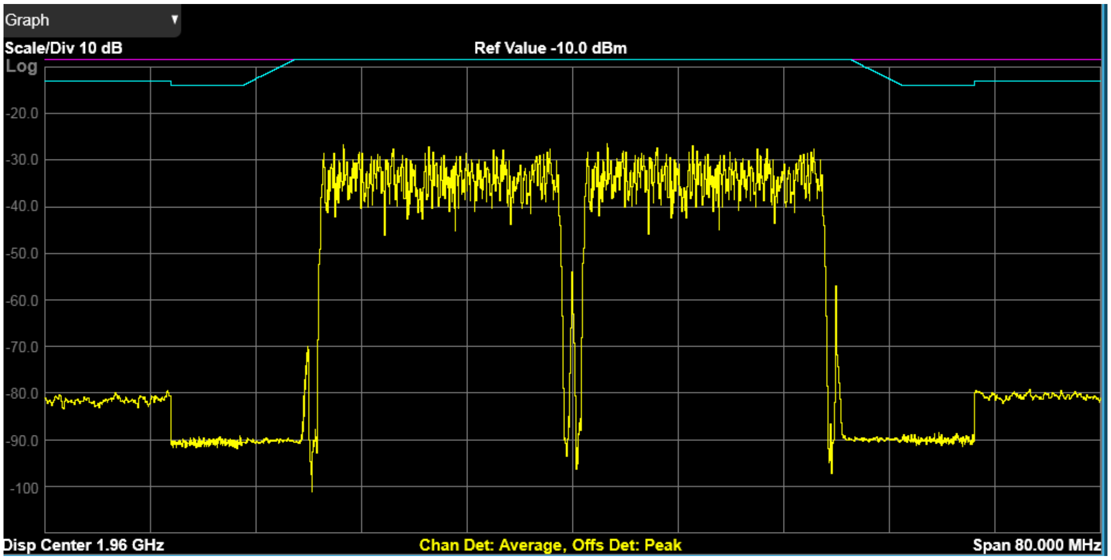
Integrated Power (Spectrum Pk Ref)



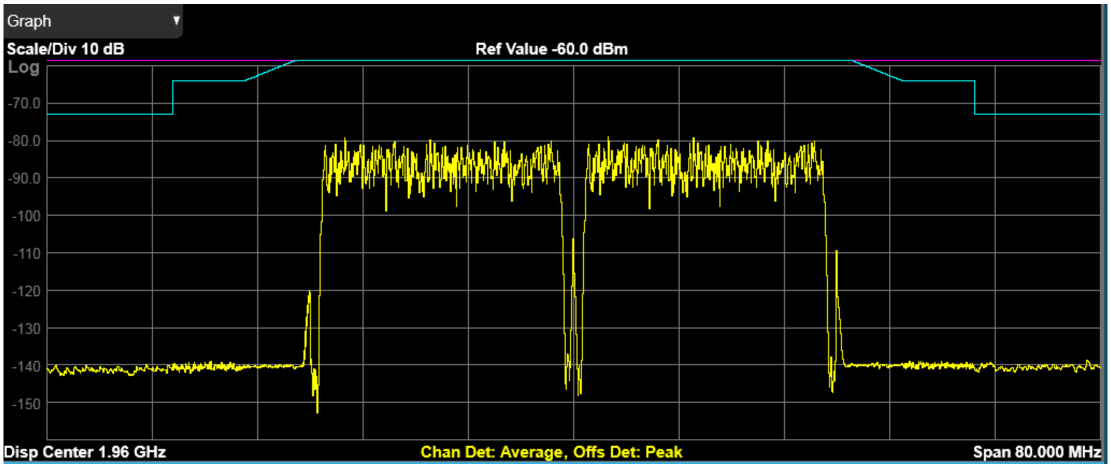
Graph Window in Carrier Info View

Sets the display to the carrier info view. The views differ depending on the setting of "Measurement Type" on page 929.

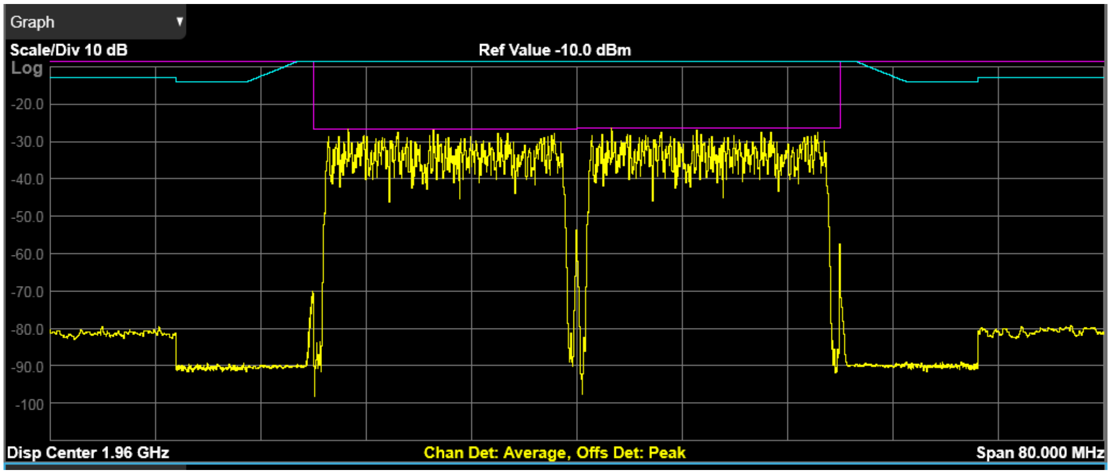
Spectrum trace (Total Pwr Ref)



Spectrum trace (PSD Ref)



Spectrum trace (Spectrum Pk Ref)



3.5.17.2 Table

Displays textual results for the measurement. The Table differs depending on which View you are in.

The views differ depending on the setting of "Measurement Type" on page 929.

View	Size	Position
Abs Pwr Freq	Two fifth, full width	Bottom
Rel Pwr Freq	Two fifth, full width	Bottom
Integrated Power	Two fifth, full width	Bottom
Gate View	One third, full width	Bottom

Table Window in Abs Pwr Freq View

Name (Measurement Type)	Unit, if any	Corresponding Results
Power		n = 1 2nd element Absolute power at the reference area
Reference		In multi-carrier applications, this column displays which carrier is reference carrier
PSD Ref (PSD Ref)		n = 5 1st element Power spectral density reference at the reference area
Spectrum Peak ref (Spectrum Pk Ref)		n = 5 1st element Spectrum peak power reference at the reference area
Measure Trace		See "Measure Trace" on page 1155
Start Freq	Hz	Start frequency for offset
Stop Freq	Hz	Stop frequency for offset
Integ BW	Hz	Measurement bandwidth for offset
Lower Peak (Total Power Ref, Spectrum Pk Ref)	dBm	Absolute peak power on minimum margin point of the negative offset
Lower (PSD Ref)	dBm/Hz	Absolute power spectrum density of the negative offset
Lower Δ lim	dB	Minimum margin from limit line which is decided by Fail Mask setting on the negative offset
Lower Freq	Hz	Frequency on minimum margin point of the negative offset
Upper Peak (Total Power Ref, Spectrum Pk Ref)	dBm	Absolute peak power on minimum margin point of the positive offset
Upper (PSD Ref)	dBm/Hz	Absolute power spectrum density of the positive offset
Upper Δ lim	dB	Minimum margin from limit line which is decided by Fail Mask setting on the positive offset
Upper Freq	Hz	Frequency on minimum margin point of the positive offset

Table Window in Carrier Info View

Only available in MSR, LTE-Advanced FDD/TDD and 5G NR Modes. Carrier center frequency can be displayed in either offset or absolute frequency depending on Carrier Freq.

LTE-Advanced FDD/TDD has a different carrier info table from that in MSR in this view, which displays with measured component carrier powers and its power spectral density in the order of component carrier index in one of the view windows.

Name	Unit, if any	Corresponding Results
Total Carrier Power		The total power of all the carriers with carrier measure state set to yes. The power is calculated by integrating across the bandwidth declared by the Carrier Integ Bw parameter for each carrier and then totaling the sums. The total integration bandwidth is shown as part of the result. This will be the total of the Carrier Integ Bw of the carriers used in calculating the total carrier power. If the RRC Filter is on, then the integration bandwidth used is (1 + alpha)/T where T = 1/(Carrier Integ Bw) multiplied by the number of carriers with carrier measure state set to yes
RF-BW		Displays the total bandwidth from the lowest carrier to uppermost carrier
Carrier Power	dBm	The power in all the currently defined carriers with measure state is on. The power is calculated by integrating across the bandwidth declared by the Carrier Integ Bw parameter. The integration bandwidth is shown as part of the result. This is the value of the Carrier Integ Bw for the carrier unless the RRC Filter is on, then the integration bandwidth used is the displayed value, which is (1 + alpha)/T where T = 1/(Carrier Integ Bw)
Integration Bandwidth	Hz	Shows carrier transmission bandwidth
Filter		Displays whether RRC filter is used or not
Offset Frequency	Hz	Shows the offset frequency from the carrier reference frequency in multi-carrier measurements. The carrier frequency display type

Name	Unit, if any	Corresponding Results
		determines whether the relative frequency or absolute frequency will be displayed
Sub-block		Displays which sub-block the carrier belongs to in the intra-band non-contiguous aggregation mode. The column will be displayed when **Carrier Allocation** is Non-contiguous
Measure		Indicates whether the carrier power is present or not

3.5.17.3 Gate

Allows you to see your Gating signal at the same time as the measured data. See the description under "Gate View On/Off" on page 2915 in **Trigger**, **Gate Settings**.

Views in which the **Gate** window appears:

View	Size	Position
Gate View	One third, full width	Top

3.5.18 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.5.18.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The reference line is at the top, center, or bottom of the graticule, depending on the value of "Ref Position" on page 798.

Remote Command	`:DISPlay:SEMask:WINDow[1]:TRACe:Y[:SCALe]:RLEVel <real>` `:DISPlay:SEMask:WINDow[1]:TRACe:Y[:SCALe]:RLEVel?`
Example	`:DISP:SEM:WIND:TRAC:Y:RLEV 100` `:DISP:SEM:WIND:TRAC:Y:RLEV?`
Couplings	When "Auto Scaling" on page 798 is ON (default), this value is automatically determined by the measurement result. If you set a value manually, **Auto Scaling** changes to `OFF` Attenuation is not coupled to **Ref Value**
Preset	0.00 dBm
State Saved	Saved in instrument state
Min/Max	-250.00 dBm / 250.00 dBm
Annotation	Ref <value> top left of graph
Backwards Compatibility SCPI	`:DISPlay:SEMask:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RLEVel`

Scale/Div

For measurements that support a logarithmic Y-Axis, **Scale/Div** sets the height of one division of the graticule in the current Y-Axis unit.

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule division on the display, the total amplitude range of the graph is typically 10x this amount. For example, if **Scale/Div** is 10 dB, then the total range of the graph is 100 dB.

Remote Command	`:DISPlay:SEMask:WINDow[1]:TRACe:Y[:SCALe]:PDIVision <rel_ampl>` `:DISPlay:SEMask:WINDow[1]:TRACe:Y[:SCALe]:PDIVision?`
Example	`:DISP:SEM:WIND:TRAC:Y:PDIV 15dB` `:DISP:SEM:WIND:TRAC:Y:PDIV?`
Couplings	When "Auto Scaling" on page 798 is `ON`, this value is automatically determined by the measurement result. If you set a value manually, **"Auto Scaling" on page 798** automatically changes to `OFF`
Preset	10.00 dB / Div
State Saved	Saved in instrument state
Min	0.10 dB
Max	20 dB
Annotation	<value> dB/ left upper of graph
Backwards Compatibility SCPI	`:DISPlay:SEMask:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PDIVision`

Scale Range

Sets the Y-Axis scale range.

Remote Command	Replace `<meas>` with the identifier for the current measurement
	`:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe <rel_ampl>`
	`:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe?`

Example	`:DISP:CHP:WIND:TRAC:Y:RANG 100` `:DISP:CHP:WIND:TRAC:Y:RANG?`
Couplings	Coupled to **Scale/Div** as follows **Scale Range** = **Scale/Div** * 10 (number of divisions) When you change this value, **Auto Scaling** automatically changes to `OFF`
Preset	100 dB
State Saved	Saved in instrument state
Min	1
Max	200

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change "Ref Value" on page 796.

Remote Command	`:DISPlay:SEMask:WINDow[1]:TRACe:Y[:SCALe]:RPOSition TOP | CENTer | BOTTom` `:DISPlay:SEMask:WINDow[1]:TRACe:Y[:SCALe]:RPOSition?`
Example	`:DISP:SEM:WIND:TRAC:Y:RPOS CENT` `:DISP:SEM:WIND:TRAC:Y:RPOS?`
Preset	`TOP`
State Saved	Saved in instrument state
Range	`TOP|CENTer|BOTTom`
Annotation	The greater than (>) and less than (<) symbols are displayed on both sides of the graph to indicate the Reference Position
Backwards Compatibility SCPI	`:DISPlay:SEMask:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RPOSition`

Auto Scaling

Toggles **Auto Scaling** On or Off.

Remote Command	`:DISPlay:SEMask:WINDow[1]:TRACe:Y[:SCALe]:COUPle 0 | 1 | OFF | ON` `:DISPlay:SEMask:WINDow[1]:TRACe:Y[:SCALe]:COUPle?`
Example	`:DISP:SEM:WIND:TRAC:Y:COUP OFF` `:DISP:SEM:WIND:TRAC:Y:COUP?`
Couplings	When **Auto Scaling** is `ON`, and the **Restart** front-panel key is pressed, this function automatically sets the scale per division to 10 dB and determines the reference values based on the measurement results When you set the value of either **Scale/Div**, **Ref Value**, or **Scale Range** manually, **Auto Scaling** automatically changes to `OFF`
Preset	1
State Saved	Saved in instrument state
Range	`OFF|ON`
Backwards Compatibility SCPI	`:DISPlay:SEMask:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:COUPle`

3.5.18.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See "Dual-Attenuator Configurations" on page 799
- See "Single-Attenuator Configuration" on page 800

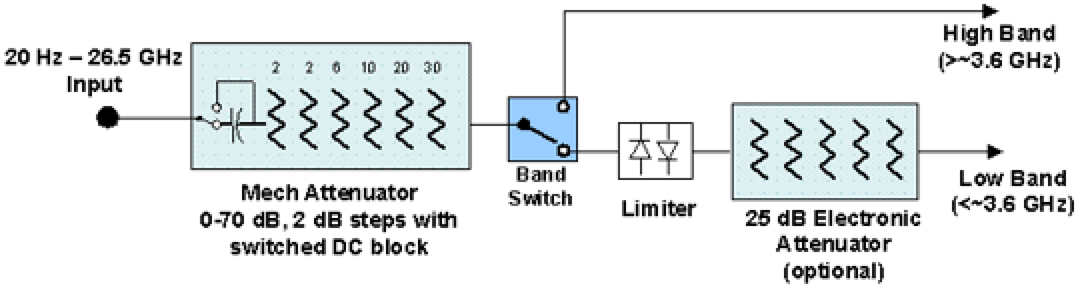
Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9420A/10A/11A/15A/16A, M9410E/11E/15E/16E, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

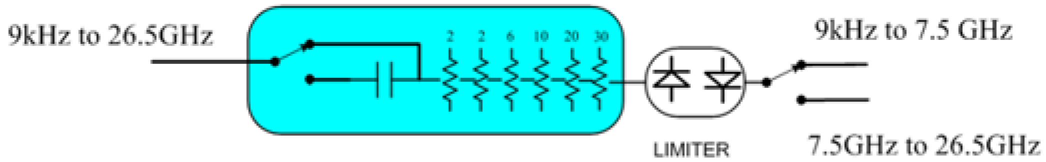
Dependencies	In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the **Range** tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

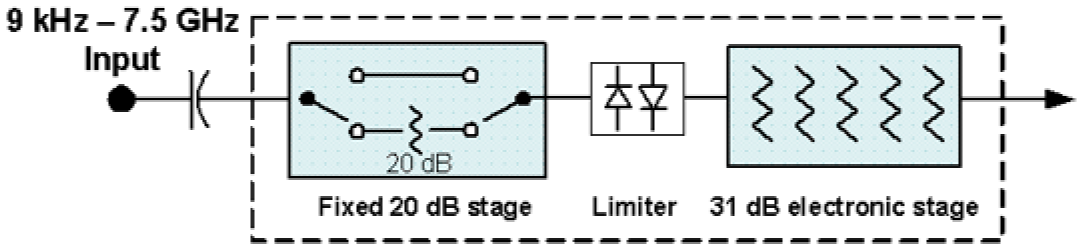


Configuration 2: Mechanical attenuator, no optional electronic attenuator

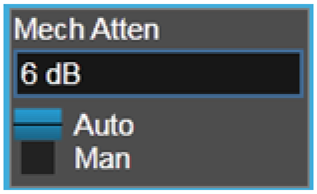


Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

Single-Attenuator Configuration



You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

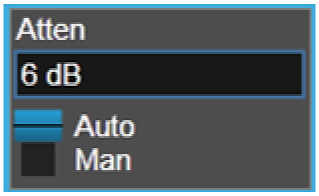


Mech Atten

6 dB

Auto
Man

Dual Attenuator



Atten

6 dB

Auto
Man

Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	`[:SENSe]:POWer[:RF]:FRATten <rel_ampl>` `[:SENSe]:POWer[:RF]:FRATten?`
Example	`:POW:FRAT 14` `:POW:FRAT?`
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See **Reference Level** and "Mech Atten" on page 2161 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	When the **Input** is **RF**, and the **Input Port** is **RF Input 2**, and the Full Range Attenuator is installed: On the Meas Bar, the field “Atten” displays as follows: – If the sweep is entirely < 50 GHz, the value shown after “Atten:” is equal to Mech Atten + Elec Atten + Full Range Atten – If the sweep is entirely > 50 GHz, the value shown after “Atten:” is equal to Full Range Atten – If the sweep straddles 50 GHz, the value shown after “Atten:” is preceded by the symbol “>=” and is equal to Full Range Atten In the **Amplitude**, "Y Scale" on page 2153 menu, and the Atten **Meas Bar** dropdown menu panel, a summary is displayed as follows: “Total Atten below 50 GHz” followed by the value of Full Range Atten + Mech Atten + Elec Atten “Total Atten above 50 GHz” followed by the value of Full Range Atten For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown: – Attenuator summary: – Total Atten below 50 GHz: 30 dB – Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models, and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to **Ref Level**, "Internal Preamp" on page 2183 Gain, any External Gain that is entered, and **Max Mixer Level** (if available), as described in the table below.

See "Attenuator Configurations and Auto/Man" on page 804

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation <rel_ampl>` `[:SENSe]:POWer[:RF]:ATTenuation?`
Example	`:POW:ATT 20` Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of "main" attenuation) In either case, if the attenuator was in Auto, it is set to Manual
Dependencies	Some measurements do not support **Auto** setting of **Mech Atten**. In these measurements, the **Auto/Man** selection is not available, and the **Auto/Man** toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the **Auto/Man** toggle function is not available. The state of **Auto/Man** is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 2164 See "Attenuator Configurations and Auto/Man" on page 804 for more information on the **Auto/Man** functionality
Couplings	If the RF Input Port is the RF Input: – If the USB Preamp is connected to USB, use 0 dB for **Mech Atten** – Otherwise compute the auto-selected value of **Mech Atten** based on **Reference Level**, **Int Preamp**, **External Gain**, **Ref Level Offset**, **Max Mixer Level**, **µW Path Control** and **IF Gain** settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) – In N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the value of "Full Range Atten" on page 2160 from the result to determine the **Mech Atten**. Limit the value so that it is never lower than 0 dB and so that total attenuation, including **Full Range Atten**, is never less than 6 dB (total attenuation, including **Full Range Atten** below 6 dB, can never be chosen by Auto) In External Mixing and BBIQ, where the attenuator is not in the signal path, the attenuator setting changes as described above when **Mech Atten** is in **Auto**, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input For CXA-m with Option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is <= 7.5 GHz. So, when the frequency is changed from below

	7.5 GHz to above 7.5 GHz, the attenuation setting changes to a multiple of 10 dB that is no smaller than the previous setting. For example, 4 dB attenuation changes to 10 dB
Preset	**Auto** The Auto value is 10 dB
State Saved	Saved in instrument state
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased
Max	CXA Option 503 or 507: 50 dB EXA: 60 dB All other models: 70 dB Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as: *Atten: <total> dB (e<elec>)* The e letter is in amber in Single-Attenuator configurations For example: Dual-Attenuator configuration: *Atten: 24 dB (e14)* Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB Single-Attenuator configuration: *A: 24 dB (e14)* Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation) When in Manual, a # sign appears in front of Atten in the annotation

Auto Function

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:ATTenuation:AUTO?`
Example	Turn **Auto Mech Atten**ON: `:POW:ATT:AUTO ON`
Dependencies	`:POW:ATT:AUTO` is only available in measurements that support **Auto**, such as Swept SA
Preset	ON

Attenuator Configurations and Auto/Man

As described under "Attenuation" on page 2158, there are two distinct attenuator configurations available in the X-Series, the Single Attenuator and Dual-Attenuator configurations.

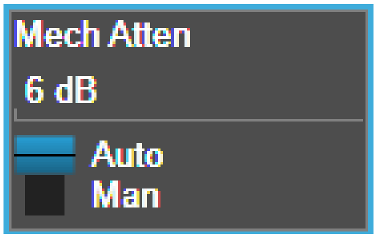
In Dual-Attenuator configurations, we have mechanical attenuation and electronic attenuation, and current total attenuation is the sum of electronic + mechanical attenuation.

In Single-Attenuator configurations, we refer to the attenuation set using "Mech Atten" on page 802 (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then current total attenuation is the sum of main + soft attenuation.

See "Elec Atten" on page 2164 for more about “soft” attenuation.

NOTE

In some measurements, the **Mech Atten** control has an **Auto/Man** function. In these measurements, an **Auto/Man** switch is shown on the **Mech Atten** control:



Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no **Auto/Man** function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details of the Electronic Attenuator, see "More Information" on page 806

Remote Command	`[:SENSe]:POWer[:RF]:EATTenuation <rel_ampl>` `[:SENSe]:POWer[:RF]:EATTenuation?`
Example	`:POW:EATT 10` `:POW:EATT?`
Notes	Electronic Attenuation’s specification is defined only when **Mech Atten** is 6 dB
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no “electronic attenuator”; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, `EATT` SCPI commands are accepted for compatibility with other X-series instruments, and set a “soft” attenuation. The “soft” attenuation is treated as an addition to the “main” attenuation value set by the **Attenuation** control or `:POW:ATT`, and affects the total attenuation displayed on the **Attenuation** control and the Meas Bar The electronic attenuator, and the “soft” attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out If "Internal Preamp" on page 2183 is `ON` (that is, set to Low Band or Full), the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned If both the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence If the electronic/soft Attenuator is enabled, then the **Stop Freq** of the instrument is limited to 3.6 GHz and **Internal Preamp** is unavailable If "LNA" on page 2185 is `ON`, the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out. This coupling works in the following modes/measurements: – Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes – Transmit On|Off Power measurement in 5GNR Mode – Power vs. Time and Transmit Power measurement in GSM/EDGE Mode – Burst Power measurement in Spectrum Analyzer Mode The SCPI-only “soft” electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement
Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in "Mechanical Attenuator

	Transition Rules" on page 807
Preset	0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the **Mech Atten** control description

Auto Function

Remote Command	`[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:EATTenuation:STATe?`
Example	`:POW:EATT:STAT ON` `:POW:EATT:STAT?`
Preset	`OFF` (Disabled) for Swept SA measurement `ON` (Enabled) for all other measurements that support the electronic attenuator

NOTE The maximum **Center Frequency** for Low Band can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values <= 40 MHz have a maximum Low Band frequency of 3.6 GHz, while 40 MHz < IFBW <= 1 GHz have a maximum of 3.3 GHz, and 1 GHz < IFBW <= 1.5 GHz have a maximum of 3.5 GHz. This frequency is reflected in the disabled message displayed for Electrical Attenuator. For N9032B and N9042B IFBW values > 1.5 GHz do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, the Electrical Attenuator will remain disabled no matter the Center Frequency.

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See "Using the Electronic Attenuator: Pros and Cons" on page 808 for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the “soft” attenuation feature replaces the Dual-Attenuator configuration’s electronic attenuator. All the same couplings and limitations apply. See "Attenuator Configurations and Auto/Man" on page 2163

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled
- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "Pre-Adjust for Min Clipping" on page 2168.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Example	`:POW:RANG:OPT IMM`
Notes	Executing **Adjust Atten for Min Clipping** initiates the measurement
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate` is executed.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLy | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?`
Example	`:POW:RANG:OPT:TYPE EONL` `:POW:RANG:OPT:TYPE?`
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	`COMBined`
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is `ON`, it applies the adjustment described under "Adjust Atten for Min Clipping" on page 2167 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "Adjustment Algorithm" on page 810

Selection	SCPI	Note
Off	`OFF`	This is the default setting
On	`ON`	Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the `ON` parameter is supported and mapped to `COMBined`
Elec Atten Only	`ELECtrical`	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Elec+Mech Atten	`COMBined`	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Example	`:POW:RANG:OPT:ATT OFF` `:POW:RANG:OPT:ATT?`

Notes	The parameter option `ELECtrical` sets this function to `ON` in Single-Attenuator models The parameter option `COMBined` is mapped to `ELECtrical` in Single-Attenuator models. If you send `COMBined`, it sets the function to `ON` and returns `ELEC` to a query For SCPI compatibility with models that do not have an input attenuator, the `ON` parameter is honored and mapped to `COMBined`
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when "Elec Atten" on page 2164 is `OFF` or grayed-out, "Pre-Adjust for Min Clipping" on page 809 is grayed-out Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	`OFF` when Elec Atten is Disabled at preset, otherwise `ELEC`
State Saved	Saved in instrument state
Range	Dual-Attenuator models: Off | Elec Atten Only | Mech + Elec Atten Single-Attenuator models: Off | On

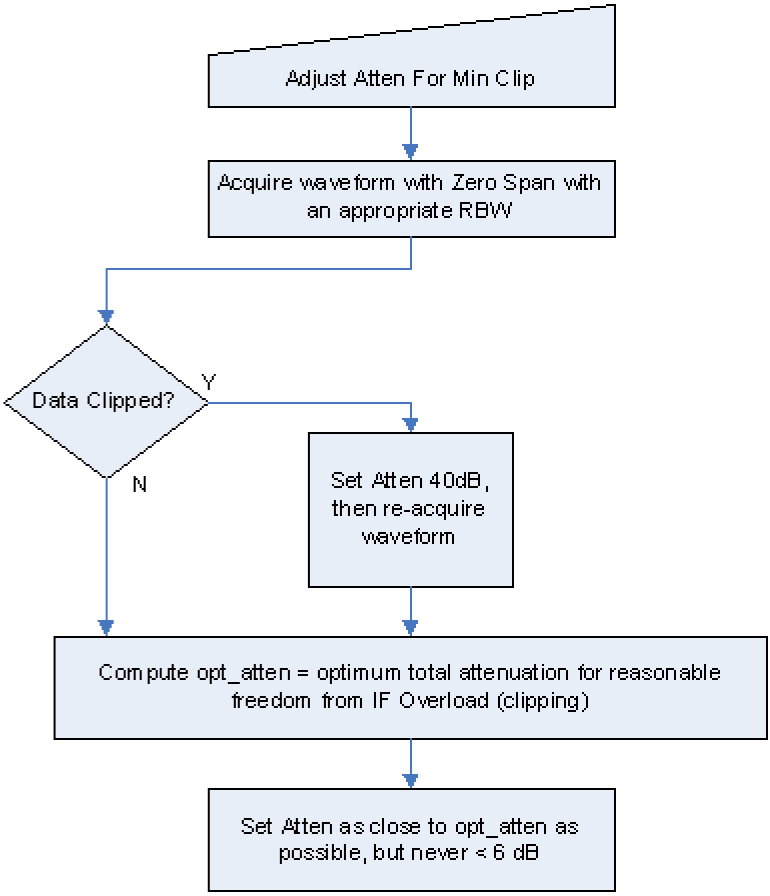
Backwards Compatibility Command

Notes	`ON` aliases to "Elec Atten Only" (`:POW:RANG:OPT:ATT ELEC`) `OFF` aliases to "Off" (`:POW:RANG:OPT:ATT OFF`) `:POW:RANG:AUTO?` returns true if `:POW:RANG:OPT:ATT` is not `OFF`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:RANGe:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:RANGe:AUTO?`

Adjustment Algorithm

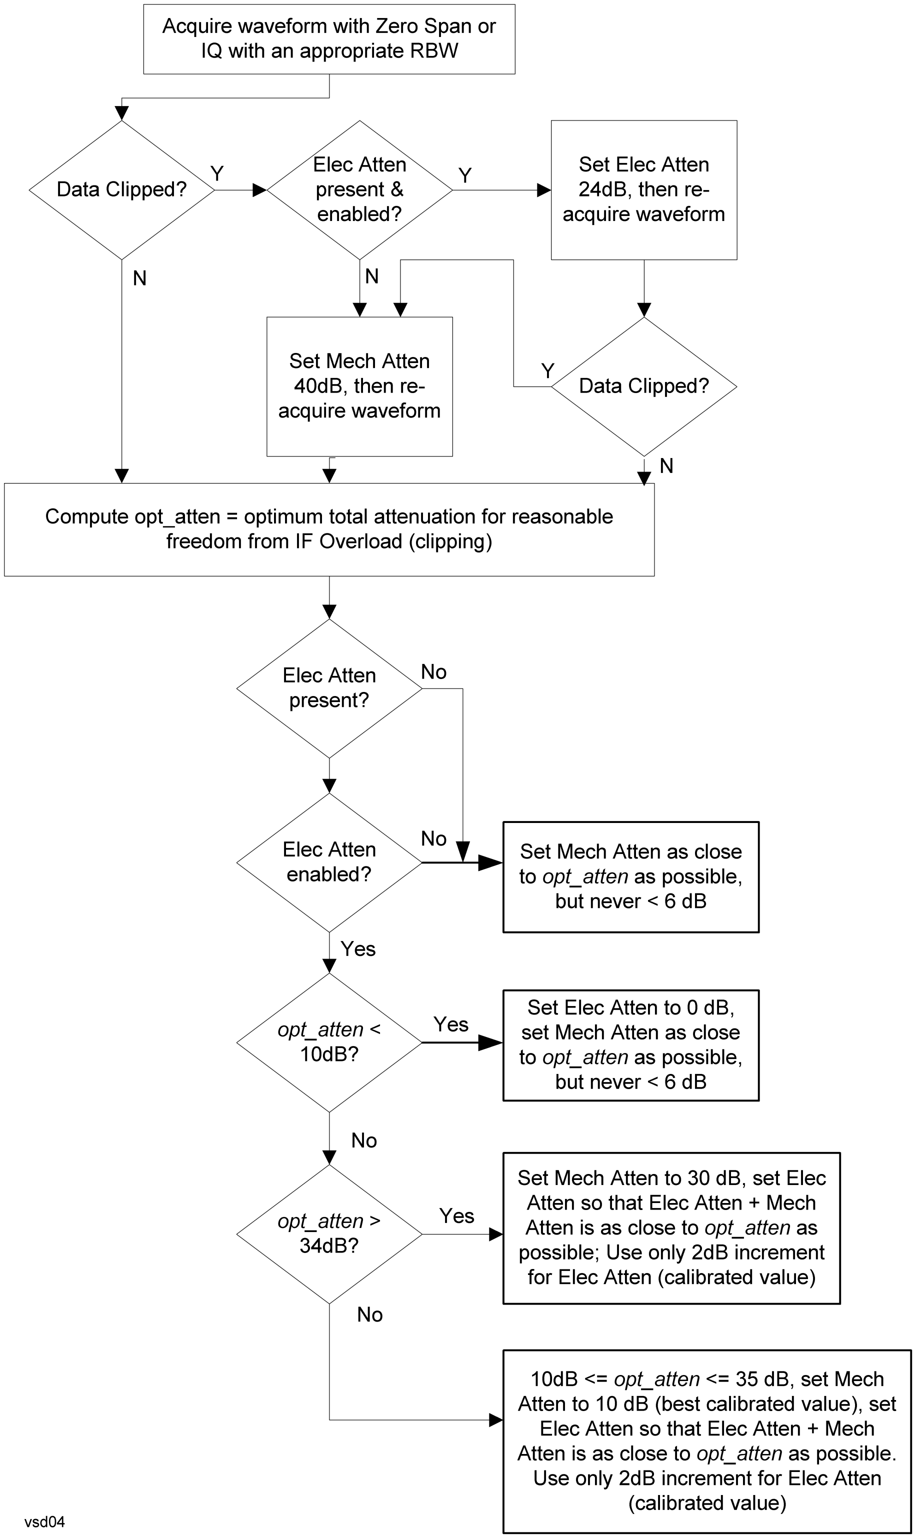
The algorithms for the adjustment are documented below:

Single-Attenuator Models



Dual-Attenuator models

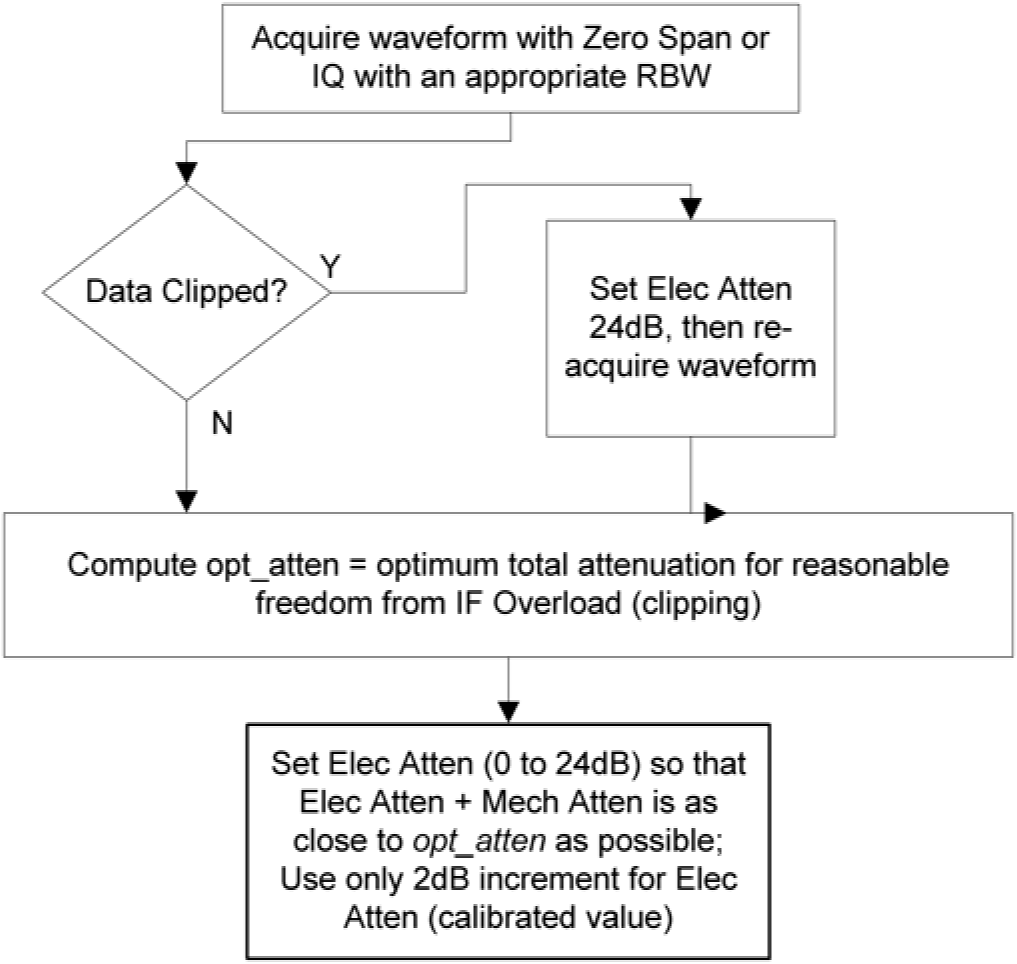
"Adjust Atten for Min Clipping" on page 2167 or "Pre-Adjust for Min Clipping" on page 809 selection is Mech + Elec Atten:



Acquire waveform with Zero Span or IQ with an appropriate RBW
Data Clipped?
Y
Elec Atten present & enabled?
Y
Set Elec Atten 24dB, then re-acquire waveform
N
N
Set Mech Atten 40dB, then re-acquire waveform
Y
Data Clipped?
N
Compute opt_atten = optimum total attenuation for reasonable freedom from IF Overload (clipping)
Elec Atten present?
No
Elec Atten enabled?
No
Set Mech Atten as close to opt_atten as possible, but never < 6 dB
Yes
opt_atten < 10dB?
Yes
Set Elec Atten to 0 dB, set Mech Atten as close to opt_atten as possible, but never < 6 dB
No
opt_atten > 34dB?
Yes
Set Mech Atten to 30 dB, set Elec Atten so that Elec Atten + Mech Atten is as close to opt_atten as possible; Use only 2dB increment for Elec Atten (calibrated value)
No
10dB <= opt_atten <= 35 dB, set Mech Atten to 10 dB (best calibrated value), set Elec Atten so that Elec Atten + Mech Atten is as close to opt_atten as possible. Use only 2dB increment for Elec Atten (calibrated value)
vsd04

"Pre-Adjust for Min Clipping" on page 809 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.



Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?`
Example	`:POW:ATT:STEP 2` `:POW:ATT:STEP?`
Notes	Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

3.5.18.3 Range (Non-attenuator models)

Only available for Keysight’s modular signal analyzers and certain other Keysight products, such as VXT and M941xE.

State Saved	No

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe <real>` `[:SENSe]:POWer[:RF]:RANGe?`
Example	`:POW:RANG 10 dBm` `:POW:RANG?`
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the **Center Frequency** The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min/Max	–/+100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements

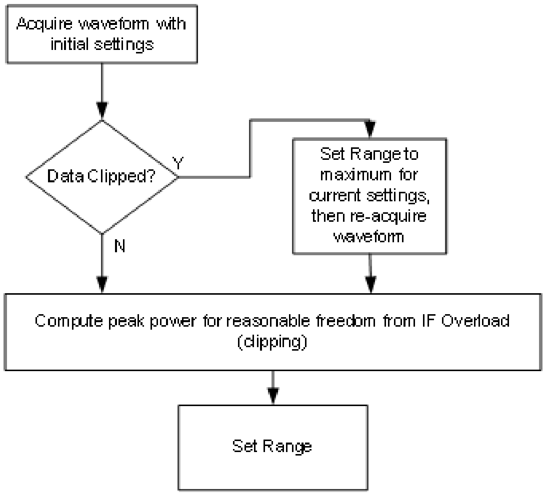
Pre-Adjust for Min Clipping

If this function is `ON`, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Notes	Because there is no attenuator control available in these models, the control displays only `ON` and `OFF` choices. However, for SCPI compatibility with other platforms, all three parameters (`ELECtrical`, `COMBined`, and `ON`) are honored and all are mapped to `ELECtrical`, so if any of these three parameters is sent, a subsequent query will return `ELEC`
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements
Preset	`OFF` for Swept SA measurement; `ON` for all other measurements that support **Pre-Adjust for Min Clipping**
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:



Peak-to-Average Ratio

Used with "Range (Non-attenuator models)" on page 2177 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:PARatio <real>` `[:SENSe]:POWer[:RF]:RANGe:PARatio?`	
Example	`:POW:RANG:PAR 12 dB`	
Notes	In some Modes, this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempts to change the value via SCPI are ignored, but no error message is generated	
Dependencies	Does not appear in Spectrum Analyzer Mode	
Preset	VXT Models M9410A/11A	0 dB
	All Others	10 dB
State Saved	Saved in instrument state	
Min	0 dB	
Max	VXT Models M9410A/11A	50 dB
	All Others	20 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "Peak-to-Average Ratio" on page 2179. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real>` `[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?`
Example	`:POW:RANG:MIX:OFFS -5 dB`
Preset	0 dB
State Saved	Saved in instrument state
Min	VXT Models M9410A/11A: -34 dB All Others: -35 dB
Max	30 dB

3.5.18.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9420A, or UXM.

This tab *does* appear in VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E, because "Software Preselection" on page 2195 is under this tab, and VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range

between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "Preselector Adjust" on page 2182 changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in "Proper Preselector Operation" on page 818.

Remote Command	`[:SENSe]:POWer[:RF]:PCENter`
Example	`:POW:PCEN`
Notes	The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command
Dependencies	Does not appear in CXA-m, nor in VXT Models M9410A/11A/15A/16A, M9410E/11E/15E/16E Grayed-out if the microwave preselector is off – If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken – Grayed-out if entirely in Band 0, that is, if **Stop Freq** is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if **Start Freq** is above 50 GHz – Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 – Grayed-out in the **Spectrogram** View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering appears in "Preselector Adjust" on page 2182
Status Bits/OPC dependencies	When centering the preselector, `*OPC` does not return true until the process is complete and a subsequent measurement has completed, nor are results returned in response to `:READ` or `:MEASure` queries The `Measuring` bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak

search to find

2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "Presel Center" on page 2181 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	`[:SENSe]:POWer[:RF]:PADJust <freq>` `[:SENSe]:POWer[:RF]:PADJust?`
Example	`:POW:PADJ 100KHz` `:POW:PADJ?`
Notes	The value on the control is displayed to 0.1 MHz resolution
Dependencies	– Does not appear in CXA-m – Does not appear in VXT Models M9410A/11A/15A/16A – Does not appear in M9410E/11E/15E/16E – Grayed-out if microwave preselector is off – Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz – Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the **Spectrogram** View
Preset	0 MHz

State Saved	The **Preselector Adjust** value set by "Presel Center" on page 2181, or by manually adjusting **Preselector Adjust** Not saved in instrument state, and does not survive a Preset or power cycle
Min/Max	–/+500 MHz
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PADJust` `[:SENSe]:POWer[:RF]:MMW:PADJust`

Backwards Compatibility Command

Notes	The command has no effect, and the query always returns `MWAVe`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVe | MMWave | EXTernal` `[:SENSe]:POWer[:RF]:PADJust:PRESelector?`

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec’d below 9 kHz".

Selection	Example	Note
Off	:POW:GAIN OFF	
Low Band	:POW:GAIN ON :POW:GAIN:BAND LOW	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	:POW:GAIN ON :POW:GAIN:BAND FULL	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE The maximum **Center Frequency** for **Low Band**, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values <= 40 MHz have a maximum **Low Band** frequency of 3.6 GHz, while 40 MHz < IFBW <= 1 GHz have a maximum of 3.3 GHz, and 1 GHz < IFBW <= 1.5 GHz have a maximum of 3.5 GHz. IFBW values > 1.5 GHz do not support a **Center Frequency** that can reach the **Low Band** maximum frequency. In these cases, **N/A** is displayed in the square brackets for **Low Band**.

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:BAND LOW | FULL` `[:SENSe]:POWer[:RF]:GAIN:BAND?`
Example	`:POW:GAIN:BAND LOW` `:POW:GAIN:BAND?`
Dependencies	Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A nor in M9410E/11E/15E/16E If `:POW:GAIN:BAND FULL` is sent when a low band preamp is available, the preamp band parameter is set to `LOW` instead of `FULL`, and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled
Preset	`LOW`
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says “Off” if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says “3.6 GHz”. If it is a 13.6 GHz preamp and it is set to Full Range the annotation says “13.6 GHz” When the USB Preamp is connected to USB, the Preamp annotation says “Preamp: USB” if the internal preamp is off or “Preamp: USB, Int” if the internal preamp is on (only for measurements that support the USB preamp)

Auto Function

Remote Command	`[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN[:STATe]?`
Example	`:POW:GAIN OFF` `:POW:GAIN?`
Preset	`OFF`

LNA

Lets you turn the Low Noise Amplifier (LNA) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to "Internal Preamp" on page 2183. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

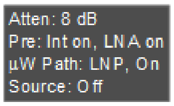
For best possible sensitivity, **LNA** can be turned on *together* with "Internal Preamp" on page 2183, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see "More Information" on page 822

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?`
Example	`:POW:GAIN:LNA ON`
Dependencies	Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9420A/10A/11A M9410E/11E/15E/16E support LNA May not appear in some measurements **LNA** is not available when the electronic/soft attenuator is enabled
Preset	`OFF`
State Saved	Saved in State

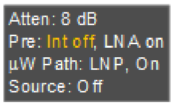
More Information

When **LNA** is installed, the preamp annotation changes to show the state of both **LNA** and **Internal Preamp**. Below is an example:



Atten: 8 dB
Pre: Int on, LNA on
µW Path: LNP, On
Source: Off

Note that when operating entirely in the low band (below about 3.6 GHz), if **LNA** is on, **Internal Preamp** is switched off (even if you have its switch set to ON). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:



Atten: 8 dB
Pre: Int off, LNA on
µW Path: LNP, On
Source: Off

µW Path Control

Options for this control include **µW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the µW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **µW Preselector Bypas**s, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the µW Preselector’s bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21-26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp’s compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **µW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. µW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See "Low Noise Path Enable" on page 827
µW Preselector Bypass	:POW:MW:PATH MPB	See "µW Preselector Bypass" on page 829
Full Bypass Enable	:POW:MW:PATH FULL	See "Full Bypass Enable" on page 830

<table>

<code>[:SENSe]:POWer[:RF]:MW:PATH?</code></td></tr>
<tr><td>Example</td><td><code>:POW:MW:PATH LNP</code>
Enables the Low Noise path
<code>:POW:MW:PATH?</code></td></tr>
<tr><td>Notes</td><td>When "Presel Center" on page 2181 is performed, the instrument momentarily switches to the Standard Path, regardless of the setting of µW Path Control
The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean “when the low noise path is enabled” but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is Low Noise Path Enable or Full Bypass Enable. In the case where the DC Block is switched in, the instrument is now AC-coupled. However, if you selected DC coupling, the UI would still behave as though it were DC-coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC-coupled
Alignment switching ignores the settings in this menu, and restores them when finished</td></tr>
<tr><td>Dependencies</td><td>Does not appear in CXA-m, VXT Models M9410A/11A/15A/16A, nor in M9410E/11E/15E/16E, BBIQ and External Mixing
– The Low Noise Path Enable selection does not appear unless Option LNP is present and licensed
– The µW Preselector Bypass selection does not appear unless Option MPB is present and licensed
– The Full Bypass Enable selection does not appear unless options LNP and MPB are both present as well as option FBP
In any of these cases, if the required options are not present and the SCPI command is sent, error -241, "Hardware missing; Option not installed" is generated
Low Noise Path Enable and Full Bypass Enable are grayed-out if the current measurement does not support them
Low Noise Path Enable and Full Bypass Enable are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, “Setting Conflict; Feature not supported for this measurement”</td></tr>

µW Path Control Auto

In VMA, WLAN, 5G NR, CQM Modes, an **Auto/Man** switch is added to **µW Path Control**:

This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

Measurement	µW Path Control Auto behavior
Digital Demod	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Custom OFDM	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Measurement	µW Path Control Auto behavior
ACP	Always Presel Bypass
SEM	Always Presel Bypass
Spurious Emissions	Always Standard Path

WLAN Mode

Measurement	µW Path Control Auto behavior
Modulation Analysis	Always Presel Bypass
Spectral Flatness	Always Presel Bypasss
Power vs Time	Always Presel Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Always Presel Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Always Presel Bypass
SEM	For 11be 320M, when ‘Enabled Wideband IF for FFT’ is OFF or ‘Sweep Type Rule’ is Best Dynamic Range, auto µW path is standard For other cases, auto µW path is presel bypass if presel bypass is enabled, auto µW path is standard if presel bypass is not enabled
Spurious Emissions	Always Standard Path

5G NR Mode

Measurement	µW Path Control Auto behavior
Modulation Analysis	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Channel Power	Always Standard Path
Occupied BW	Always Standard Path
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Standard Path
SEM	Always Standard Path
Spurious	Always Standard Path

Measurement	**µW Path Control Auto behavior**
Emissions	
Transmit On|Off Power	Use Standard Path unless tuned frequency > 3.6 GHz and Info BW > 15 MHz, in which case choose Preselector Bypass

Channel Quality Mode

Measurement	**µW Path Control Auto behavior**
Group Delay	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Remote Command	`[:SENSe]:POWer[:RF]:MW:PATH:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:MW:PATH:AUTO?`

Dependencies	Only appears in VMA, WLAN, 5G NR and CQM Modes
Couplings	See "µW Path Control Auto" on page 825 above
Preset	ON
Range	ON|OFF

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used,

whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

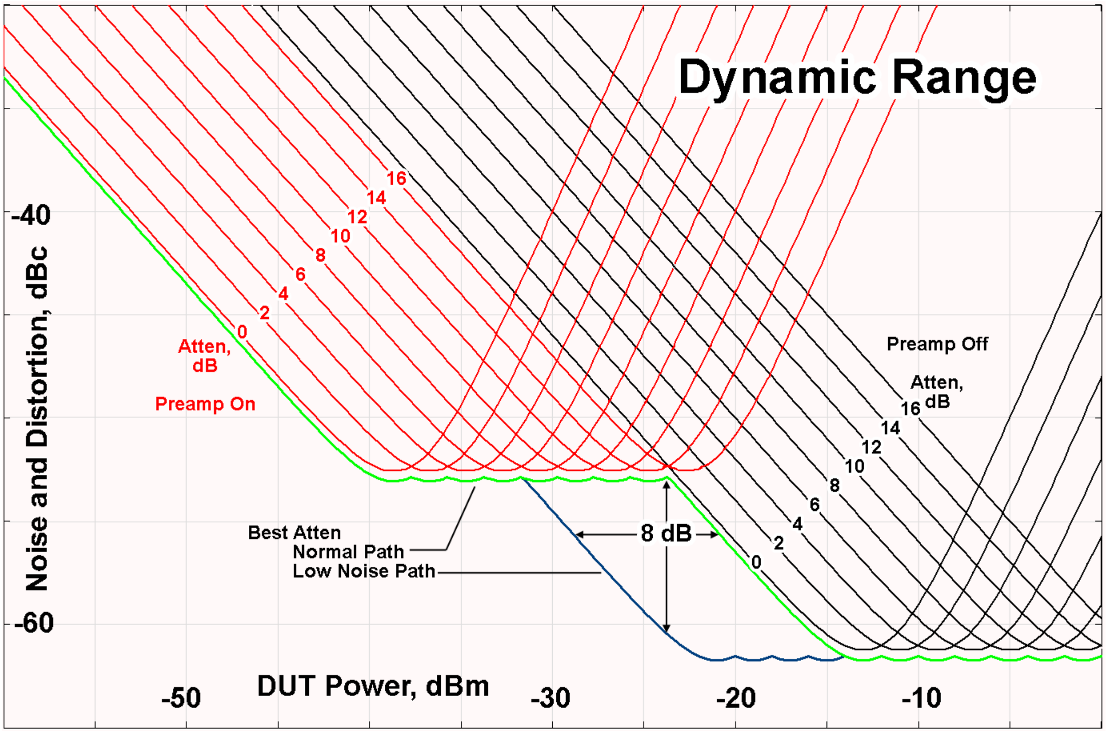
Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.



There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

µW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave presel is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION When **Full Bypass Enable** is selected, and "Y Scale" on page 2153 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently,

whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

Microwave Preselector Bypass Backwards Compatibility

Example	Bypass the microwave preselector: `:POW:MW:PRES OFF`
Notes	Included for Microwave Preselector Bypass backwards compatibility The `ON` parameter sets the `STD` path (`:POW:MW:PATH STD`) The `OFF` parameter sets path `MPB` (`:POW:MW:PATH MPB`)
Preset	`ON`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON | OFF | 0 | 1` `[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?`

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender's preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is `OFF`, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

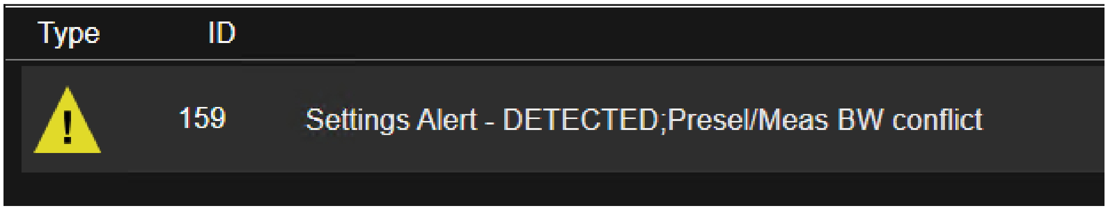
An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert;Presel/Meas BW conflict

Settings Alert message in the error queue

.



Type	ID	
⚠	159	Settings Alert - DETECTED;Presel/Meas BW conflict

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A/15A/16A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection ON at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:STATe 0 | 1 | ON | OFF` `[:SENSe]:POWer[:RF]:SWPresel:STAT?`
Example	`:POW:SWPR:STAT 1` `:POW:SWPR:STAT?`
Dependencies	Only appears in N9041B, N9042B+V2050A, VXT models M9410A/11A and M9410E/11E. Does not appear in all measurements
Couplings	Affects **Sweep Time** **Auto Tune** supports **Software Preselection**, so **Auto Tune** should be performed after setting the **Software Preselection** state
Preset	N9041B: OFF N9042B+V3050A: ON M9410A/11A: ON
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by 2 * IF / N. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- `NORMal` - mathematically removes all image and multiple responses of signals present at the input
- `ADVanced` - any trace processing (such as "max hold" or trace averaging) is performed on the points of both candidate traces before the "select minimum" operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel NORMal | ADVanced` `[:SENSe]:POWer[:RF]:SWPResel?`
Example	`:POW:SWPR NORM` `:POW:SWPR?`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 2195 is `OFF`. The grayout message is "Unavailable unless SW Presel enabled"
Preset	N9041B: `ADVanced` N9042B+V3050A: `NORMal`
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- `NORMal` – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for `NARRow` (below)
- `NARRow`– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from

wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:BW NORMal | NARRow` `[:SENSe]:POWer[:RF]:SWPResel:BW?`
Example	`:POW:SWPR:BW NARR`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 2195 is `OFF`. The grayout message is “Unavailable unless SW Presel enabled” For N9042B+V3050A, the parameter is SCPI-only, and always set to `NARRow` when **Software Preselection** is enabled
Preset	N9041B: `NORMal` N9042B+V3050A: `NARRow`
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A and M9410E/11E in bypass frequency range (1310MHz~5GHz), the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the “Prefilter” bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	`[:SENSe]:<measurement>:PFILter[:STATe] ON | OFF | 1 | 0` `[:SENSe]:<measurement>:PFILter[:STATe]?`

Example	Enable High Freq Prefilter for the Complex Spectrum Measurement in `BASIC` Mode:
	`:SPEC:PFIL ON`
	Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes:
	`:WAV:PFIL ON`
	Enable High Freq Prefilter for the Swept SA Measurement in `SA` Mode:
	`:SAN:PFIL ON`

Dependencies	Only appears in VXT models M9410A/11A with center frequency above 1310 MHz, and M9410E/11E in frequency range 1310MHz~5GHz
Preset	See "Prefilter Presets" on page 836 below

State Saved	Saved in instrument state

3.5.19 BW

Opens the Bandwidth (**BW**) menu, which contains controls for the Resolution Bandwidth functions of the instrument.

The Resolution BW functions control filter type. There are two filter types, Gaussian and Flattop. The Gaussian filters have a response curve that is parabolic on a log scale. The Flattop filter shape is a close approximation of a rectangular filter.

3.5.19.1 Settings

Contains basic Bandwidth functions. The only tab under **BW**.

RBW Filter Type

Selects the type of bandwidth filter that is used in Carriers and Offsets:

Option	SCPI	Behavior
Gaussian	`GAUSsian`	The selected filter is applied to carriers and all offsets
Flattop	`FLATtop`	
Auto Sense	`ASENse`	The filter type is automatically selected for each carrier and offset in a way such that measurement speed and accuracy are optimized Filter Auto Sense Rules: – Flattop is selected when "Enable Wideband IF for FFT" on page 962 is ON – Flattop is selected for offsets close to the reference carrier – For all other cases, Gaussian is selected

Remote Command	`[:SENSe]:SEMask:BANDwidth:SHAPe ASENse | GAUSsian | FLATtop` `[:SENSe]:SEMask:BANDwidth:SHAPe?`
Example	`:SEM:BAND:SHAP GAUS` `:SEM:BAND:SHAP?`
Preset	`ASENse`
State Saved	Saved in instrument state
Range	Auto Sense (each offset and carrier) | Gaussian (all offsets and carriers) | Flattop (all offsets and carriers)

3.5.20 Display

Lets you configure display items for the current Mode, Measurement View or Window.

3.5.20.1 Meas Display

Contains controls for setting up the display for the current Measurement, View or Window.

Limit Lines

Toggles Limit Lines display for this measurement On or Off.

Remote Command	`:CALCulate:SEMask:LLINe:STATe ON | OFF | 1 | 0`

	`:CALCulate:SEMask:LLINe:STATe?`
Example	`:CALC:SEM:LLIN:STAT OFF` `:CALC:SEM:LLIN:STAT?`
Preset	`ON`
State Saved	Saved in instrument state
Range	`ON|OFF`

Carrier Frequency Type

Sets the carrier frequency display type.

- `OFFSet`- The carrier center frequencies are displayed as offset from Carrier Ref Freq
- `ABSolute`- The carrier center frequencies are displayed as absolute frequency

Remote Command	`:DISPlay:SEMask:VIEW[1]:WINDow[1]:CINFormation:FREQuency OFFSet | ABSolute` `:DISPlay:SEMask:VIEW[1]:WINDow[1]:CINFormation:FREQuency?`
Example	`:DISP:SEM:VIEW:WIND:CINF:FREQ ABS` `:DISP:SEM:VIEW:WIND:CINF:FREQ?`
Preset	`OFFSet`
State Saved	Saved in instrument state
Range	`OFFSet|ABSolute`

3.5.20.2 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	`:DISPlay:GRATicule[:STATe] OFF | ON | 0 | 1` `:DISPlay:GRATicule[:STATe]?`
Example	`:DISP:GRAT OFF`
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis

Preset	`ON`
State Saved	Saved in instrument state

Backwards Compatibility SCPI	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF | ON | 0 | 1`
	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?`
	This command is accepted for backwards compatibility with older instruments, but the `WINDow`, `TRACe` and `GRID` parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When `OFF`, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	`:DISPlay:ANNotation:SCReen[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:SCReen[:STATe]?`
Example	`:DISP:ANN:SCR OFF`
Dependencies	Grayed-out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with ….

Remote Command	`:DISPlay:ANNotation:TRACe[:STATe] ON | OFF | 1 | 0` `:DISPlay:ANNotation:TRACe[:STATe]?`

Example	`:DISP:ANN:TRAC OFF`
Preset	`OFF`
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	`:DISPlay:ACTivefunc[:STATe] ON | OFF | 1 | 0` `:DISPlay:ACTivefunc[:STATe]?`
Example	`:DISP:ACT OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	`:DISPlay:ANNotation:MBAR[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:MBAR[:STATe]?`
Example	`:DISP:ANN:MBAR OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. Theare three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display

2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor :SYSTem:PRESet enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are using either the `:SYSTem:KLOCk` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is `OFF`, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

Name	Command
Select User View	`:DISPlay:VIEW:ADVanced:SELect`
Rename User View	`:DISPlay:VIEW:ADVanced:REName`
Delete User View	`:DISPlay:VIEW:ADVanced:DELete`
Create User View	`:DISPlay:VIEW:ADVanced:NAME`
Select Screen	`:INSTrument:SCReen:SELect`
Delete Screen	`:INSTrument:SCReen:DELete`
Delete All But This Screen	`:INSTrument:SCReen:DELete:ALL`
Add Screen	`:INSTrument:SCReen:CREate`
Rename Screen	`:INSTrument:SCReen:REName`
Sequencer On/Off	`:SYSTem:SEQuencer`

Remote Command	`:DISPlay:ENABle OFF | ON | 0 | 1` `:DISPlay:ENABle?`
Example	`:DISP:ENAB OFF`
Couplings	`:DISP:ENAB OFF` turns Backlight `OFF` and `:DISP:ENAB ON` turns Backlight `ON`, but changing Backlight settings does *not* change the state of `:DISP:ENAB`
Preset	`ON` Set by `:SYST:DEF MISC`, but not affected by `*RST` or `:SYSTem:PRESet`
State Saved	Not saved in instrument state

Backwards Compatibility Notes	`:SYST:PRES` no longer turns on `:DISPlay:ENABle` as it did in legacy analyzers

3.5.20.3 View

See "Views" on page 778

3.5.21 Frequency

Opens the **Frequency** menu, which contains controls that allow you to control the Frequency and Channel parameters of the instrument.

Some features in the **Frequency** menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset. For example, the **Center Freq** setting is the same for all measurements - it does not change as you change measurements.

3.5.21.1 Settings

Contains controls that pertain to the X axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed, and control instrument settings that affect the horizontal axis.

Carrier Reference Frequency

The center frequencies of carriers are defined as offset frequency from the **Carrier Reference Frequency** value. This reference frequency is also the reference for carrier configuration preset.

Because LTE-A, MSR and 5G NR measurements often deal with multiple carriers with distinct bandwidths, the simple **Center Frequency** parameter used in most measurements does *not* apply here. Instead, **Carrier Reference Frequency** is the key parameter. This must be distinct from the **Center Frequency** parameter used in other measurements, because **Center Frequency** can be a global parameter, and it would not make sense for **Carrier Reference Frequency** to use this global value.

In LTE-A and 5G NR Modes, if the following conditions are satisfied at the same time:

- the **Number of Component Carriers** is 1
- the **Center Freq Offset** is 0 Hz

- **Center Frequency** (SA Mode) is in **Auto** mode

then **Center Frequenc**y is equivalent to **Carrier Reference Frequency**. When **Center Frequency** changes in such conditions, its mode remains as **Auto**, and **Carrier Reference Frequency** is changed to the same value. The main purpose of this coupling is for backwards compatibility with legacy LTE/LTE TDD Modes, in which `:SENSe:FREQuency:CENTer` was used to set up the measurement frequency.

For more details, see "More Information" on page 843.

Remote Command	For LTE-A, 5G NR
	`[:SENSe]:CCARrier:REFerence <freq>`
	`[:SENSe]:CCARrier:REFerence?`
	For MSR
	`[:SENSe]:CARRier:REFerence <freq>`
	`[:SENSe]:CARRier:REFerence?`

Example	For LTE-A, 5G NR
	`:CCAR:REF 2GHz`
	`:CCAR:REF?`
	For MSR
	`:CARR:REF 2GHz`
	`:CARR:REF?`

Dependencies	Only available in LTE-A FDD/TDD, 5G NR and MSR Modes
Preset	1GHz
State Saved	Saved in instrument state
Min/Max	Depends on instrument minimum/maximum center frequency. Same as **Center Frequency**

More Information

In most applications, **Center Frequency** is generally where the carrier center is located at and thus plays a very important role. However, in LTE-Advanced TDD/FDD Modes, measurements are done based on carrier center frequencies and bandwidths, both of which are calculated or obtained according to the carriers' configuration.

The **Center Frequency** defined here is only for the Monitor Spectrum, IQ Waveform and CCDF measurements, because these three are general type measurements and focus on a certain frequency range, which may be the entire BS RF bandwidth, a frequency range of one of the component carriers, or a range far away from the component carriers to see spurious. The **Center Frequency** in these three measurements has a different meaning, therefore it must be separate from **Carrier Reference Frequency**.

Carrier center frequencies are defined using offsets from **Carrier Reference Frequency** which determines absolute frequency locations, and which can be set as both absolute and relative frequency from the carrier reference frequency.

Since **Center Frequency** is only used in the Monitor Spectrum, IQ Waveform and CCDF measurements, this control only appears on the **Frequency** menu for these measurements.

To maintain legacy LTE usability in the converged LTE & LTE-A application, when **Center Frequency** mode is **Auto** and **Number of Component Carriers** is 1, and **Center Frequency Offset** is 0 Hz, **Center Frequency** is equivalent to **Carrier Reference Frequency**, which is used to set up the frequencies of all measurements.

3.5.22 Marker

Enables you to select, set up and control the markers for the current measurement. If there are no active markers, **Marker** selects Marker 1, sets it to **Normal** (`POSition`) and places it at the center of the display. If the selected marker is `OFF`, it is set to **Normal** and placed at the center of the screen, on the trace determined by the **Marker Trace** rules.

3.5.22.1 Select Marker

Specifies the selected marker. The term “selected marker” is used throughout this document to specify which marker will be affected when you change marker settings, perform a Peak Search, etc.

This control appears above the menu panel, indicating that it applies to all controls in the **Marker** menu panels. **Select Marker** is blanked if you select a tab whose controls do *not* depend on the selected marker (for example, **Counter**).

In any menu that includes **Select Marker**, the first control is always **Marker Frequency|Time**.

Notes	The selected marker is remembered even when not in the **Marker** menu and is used if a search is done, or a Band Function is turned on, or for Signal Track or Continuous Peak
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for **Normal** marker

3.5.22.2 Settings

The controls on this tab include the Marker active function and a radio button selection of the marker control mode (**Normal**, **Delta** or **Off**) for the selected marker, as well as additional functions that help you use markers.

Marker Frequency

Sets the marker X-Axis value in the current marker X-Axis Scale unit. Has no effect if the control mode is **Off,** but is the SCPI equivalent of entering an X value if the control mode is **Normal**.

Remote Command	`:CALCulate:SEMask:MARKer[1]|2|…|12:X <freq>` `:CALCulate:SEMask:MARKer[1]|2|…|12:X?`
Example	`:CALC:SEM:MARK3:X 1.0 GHz` `:CALC:SEM:MARK3:X?`
Notes	If no suffix is sent, uses the fundamental units for the current marker X-Axis Scale. If a suffix is sent that does not match the current marker X-Axis Scale unit, an error "Invalid suffix" is generated The query returns the marker's absolute X-Axis value if the control mode is **Normal**, or the offset from the marker's reference marker if the control mode is **Delta.** The query is returned in the fundamental units for the current marker X-Axis scale: Hz for **Frequency** and **Inverse Time**, seconds for **Period** and **Time**
Preset	After a preset, all markers are turned `OFF`, so the query returns Not A Number (`NAN`)
State Saved	Saved in instrument state
Min	-9.9E+37
Max	9.9E+37
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Marker X Axis Position (Remote Command Only)

Sets the marker X-Axis Scale position in trace points. This setting has no effect if the control mode is **Off,** but is the SCPI equivalent of entering a value if the control mode is **Normal** or **Delta** - except in trace points rather than X-Axis Scale units. The entered value is immediately translated into the current X-Axis Scale units for setting the value of the marker.

Remote Command	`:CALCulate:SEMask:MARKer[1]|2|…|12:X:POSition <real>` `:CALCulate:SEMask:MARKer[1]|2|…|12:X:POSition?`
Example	`:CALC:SEM:MARK10:X:POS 1001` `:CALC:SEM:MARK10:X:POS?`
Notes	The query returns the marker's absolute X Axis value in trace points if the control mode is **Normal**, or the offset from the marker's reference marker in trace points if the control mode is **Delta.** The value is returned as a real number, not an integer, corresponding to the translation from X-Axis Scale units to trace points . When a Marker is turned on, it is placed center of the screen on the trace. Therefore, the default value depends on instrument condition. If the marker is **Off**, the response is Not A Number
Preset	After a preset, all markers are turned `OFF`, so the query returns Not A Number (`NAN`)
State Saved	Saved in instrument state

Min	-9.9E+37
Max	9.9E+37

Marker Y Axis Value (Remote Command only)

Returns the marker Y-Axis value in the current marker Y Axis unit.

Remote Command	`:CALCulate:SEMask:MARKer[1]|2|…|12:Y?`
Example	`:CALC:SEM:MARK11:Y?`
Notes	The query returns the marker Y-Axis result, if the control mode is **Normal**. If the marker is **Off**, the response is Not A Number
Preset	Result depends on Markers setup and signal source
State Saved	No
Backwards Compatibility SCPI	`:CALCulate:SEMask:MARKer[1]|2|…|12:FUNCtion:RESult?`

Marker Mode

Sets the marker control mode to `POSition` (**Normal**) or `OFF`.

If the selected marker is `OFF`, pressing **Marker** sets it to `POSition` and places it at the center of the screen, on the trace determined by the **Marker Trace** rules. At the same time, **Marker X Axis Value** appears on the Active Function area. If the current control mode for the measurement is `OFF`, there is no active function, and the active function is turned off.

Remote Command	`:CALCulate:SEMask:MARKer[1]|2|…|12:MODE POSition | OFF` `:CALCulate:SEMask:MARKer[1]|2|…|12:MODE?`
Example	`:CALC:SEM:MARK:MODE POS` `:CALC:SEM:MARK:MODE?`
Notes	Default Active Function: the active function for the selected marker's current control mode. If the current control mode is `OFF`, there is no active function, and the active function is turned off
Preset	`OFF|OFF|OFF|OFF|OFF|OFF|OFF|OFF|OFF|OFF|OFF|OFF`
State Saved	Saved in instrument state
Range	`POSition|OFF`
Annotation	Mkr# <X value> and <Marker value> upper right of graph

All Markers Off

Turns off all markers.

Remote Command	`:CALCulate:SEMask:MARKer:AOFF`
Example	`:CALC:SEM:MARK:AOFF`

Couple Markers

When this function is `ON`, moving any marker causes an equal X-Axis movement of every other marker that is not `OFF`. By "equal X-Axis movement" we mean that we preserve the difference between each marker's X-Axis value (in the fundamental X-Axis units of the trace that marker is on) and the X-Axis value of the marker being moved (in the same fundamental X-Axis units).

This may result in markers going off screen.

Remote Command	`:CALCulate:SEMask:MARKer:COUPle[:STATe] ON | OFF | 1 | 0` `:CALCulate:SEMask:MARKer:COUPle[:STATe]?`
Example	`:CALC:SEM:MARK:COUP ON` `:CALC:SEM:MARK:COUP?`
Preset	`OFF` Preset by **Mode Preset** and **All Markers Off**
State Saved	Saved in instrument state

3.5.22.3 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. This is the same as "Marker Frequency" on page 845 in the **Settings** tab.

Marker Trace

Selects the trace on which you want your marker placed. A marker is associated with one and only one trace. This trace is used to determine the placement, result, and X-Axis Scale of the marker. All markers have an associated trace; it is from that trace that they determine their attributes and behaviors, and it is to that trace that they go when they become Normal markers.

Specifying a Marker Trace manually or with this command associates the marker with the specified trace. If the marker is not `OFF`, it moves the marker from the trace it was on to the new trace. If the marker is `OFF` it stays off but is now associated with the specified trace.

The query returns the number of the trace on which the marker is currently placed.

Remote Command	`:CALCulate:SEMask:MARKer[1]|2|…|12:TRACe 1 | 2 | 3` `:CALCulate:SEMask:MARKer[1]|2|…|12:TRACe?`
Example	`:CALC:SEM:MARK2:TRAC 2` `:CALC:SEM:MARK2:TRAC?`
Notes	A marker may be placed on a blanked and/or inactive trace, even though the trace is not visible and/or updating An application may register a trace name to be displayed on the control instead of a trace number
Couplings	The state of **Marker Trace** is not affected by "Auto Couple" on page 2242 Sending the remote command causes the addressed marker to become selected
Preset	1
State Saved	Saved in instrument state

3.5.23 Meas Setup

Contains functions for setting up the measurement parameters and also contains functions for setting up parameters global to all measurements in the Mode.

3.5.23.1 Settings

Contains frequently used **Meas Setup** functions to which you will want the fastest access.

Avg/Hold Num

Toggles averaging On or Off, in addition to enabling you to set the number of measurement averages used to calculate the measurement result. The average is displayed at the end of each sweep. After the specified number of average counts, the average mode (termination control) setting determines the average action.

In the remote mode, use "Averaging On/Off" on page 849 to turn Averaging on or off.

Remote Command	`[:SENSe]:SEMask:AVERage:COUNt <integer>` `[:SENSe]:SEMask:AVERage:COUNt?`
Example	`:SEM:AVER:COUN 100` `:SEM:AVER:COUN?`

Preset	10
State Saved	Saved in instrument state
Min/Max	1/10000

Averaging On/Off

Turns Averaging on or off.

NOTE In this measurement, **Average Type** is preset to the `Log-Pwr Avg (Video)` method. Other averaging methods are not available.

Remote Command	`[:SENSe]:SEMask:AVERage[:STATe] ON | OFF | 1 | 0` `[:SENSe]:SEMask:AVERage[:STATe]?`
Example	`:SEM:AVER ON` `:SEM:AVER?`
Preset	`OFF`
State Saved	Saved in instrument state
Range	`ON|OFF`

Meas Method

Sets the measurement method:

Method	Option	Description
Integration BW	`0|OFF`	Enables you to set the channel integration bandwidth
RRC Weighted	`1|ON`	Selects Root Raised Cosine (RRC) filtering of the carriers. The a value (rolloff) for the filter is set to the value of the Filter Alpha parameter

Remote Command	`[:SENSe]:SEMask:FILTer[:RRC][:STATe] OFF | ON | 0 | 1` `[:SENSe]:SEMask:FILTer[:RRC][:STATe]?`
Example	`:SEM:FILT ON` `:SEM:FILT?`
Dependencies	WLAN: RRC Weight is not supported when the radio standard is WLAN 802.11ac (80+80MHz)
Preset	SA, LTEAFDD, LTEATDD, 5G NR, WLAN, MSR Modes: `OFF` WCDMA Mode: `ON`
State Saved	Saved in instrument state
Range	Integration BW|RRC Weighted

RRC Filter Alpha

Sets the alpha value for the RRC Filter.

Remote Command	`[:SENSe]:SEMask:FILTer[:RRC]:ALPHa <real>` `[:SENSe]:SEMask:FILTer[:RRC]:ALPHa?`
Example	`:SEM:FILT:ALPH 0.3` `:SEM:FILT:ALPH?`
Preset	0.22
State Saved	Saved in instrument state
Min/Max	0.01/1.0

Non-Contiguous Meas Region

Selects the region to measure for the non-contiguous frequency allocation.

Option	SCPI	Comments
Outer	`OUTer`	
Inner	`INNer`	
Outer & Inner	`OINNer`	Available only in 5G NR and LTE-Advanced FDD/TDD Modes

Remote Command	`[:SENSe]:SEMask:NCONtiguous:REGion INNer | OUTer | OINNer` `[:SENSe]:SEMask:NCONtiguous:REGion?`
Example	`:SEM:NCON:REG INN` `:SEM:NCON:REG?`
Dependencies	Available only in MSR, 5G NR and LTE-Advanced FDD/TDD Modes `OINNer` is available only in 5G NR and LTE-Advanced FDD/TDD Modes
Preset	`INNer`
State Saved	Yes
Range	Inner | Outer | Outer & Inner

Sweep Type Rules

Selects which set of rules will be used for automatic selection of "Sweep Type" on page 874 when **Sweep Type** mode is **Auto**.

Rule	Option	Description
Best Dynamic Range	`DRANge`	The instrument selects either swept or FFT analysis with the primary goal of dynamic range optimization. If the dynamic range of swept and FFT is very close, then it chooses the faster one. In determining

Rule	Option	Description
		the Swept or FFT setting, the auto rules use the following approach: – If the RBW > 210 Hz, use swept; for the RBW <= 210 Hz, use FFT – If Sweep Time Mode is Man, the Sweep Type is always Swept for backwards compatibility
Best Speed	`SPEed`	The instrument selects either FFT or swept analysis based on the fastest instrument speed

Remote Command	`[:SENSe]:SEMask:SWEep:TYPE:AUTO:RULes SPEed | DRANge` `[:SENSe]:SEMask:SWEep:TYPE:AUTO:RULes?`
Dependencies	In modular products such as VXT, the value is always set to Best Dynamic Range and this control does not appear
Preset	`DRANge`
State Saved	Saved in instrument state

Spur Avoidance

Because VXT models M9410A/11A/15A are direct-conversion (zero-IF) receivers, feedthrough leakage from the local oscillator appears as a spurious signal (spur) at the Center Frequency. The **Spur Avoidance** function is provided to eliminate this spur, at the expense of some measurement speed. For Spur Avoidance, the instrument uses a software algorithm to remove this spur from the displayed measurement data.

Some measurements allow you to turn off **Spur Avoidance**, but in this measurement it is always enabled. Therefore, the **Spur Avoidance** switch is unavailable (grayed-out) and set to ON.

If you press the grayed-out switch, a popup message appears stating:

Always enabled in this measurement. See manual for details

Remote Command	`[:SENSe]:SEMask:SAVoid[:STATe]?`
Example	`:SEM:SAV?` Always returns ON
Dependencies	Only appears in VXT models M9410A/11A/15A
Preset	ON
State Saved	Saved in instrument state
Range	ON

Offset/Limits Config Table

Enables you to set up the measurement parameters for offset pairs and to set the power limits for start and stop frequencies of the selected offsets. For example, you can assign the start and stop frequencies, select the resolution bandwidth, and set the sweep time.

Before UE, the LTE-Advanced FDD/TDD standards gave the test specification requirements for BS intra-band contiguous aggregation and intra-band non-contiguous aggregation modes. However, for UE, only the requirements of intra-band contiguous aggregation modes are defined. So, the standards don't support making the measurement in UE intra-band non-contiguous aggregation mode for LTE-Advanced FDD/TDD. As a result, the preset values of Inner Offset/Limits are temporarily set as those of Outer Offset/Limits for UE.

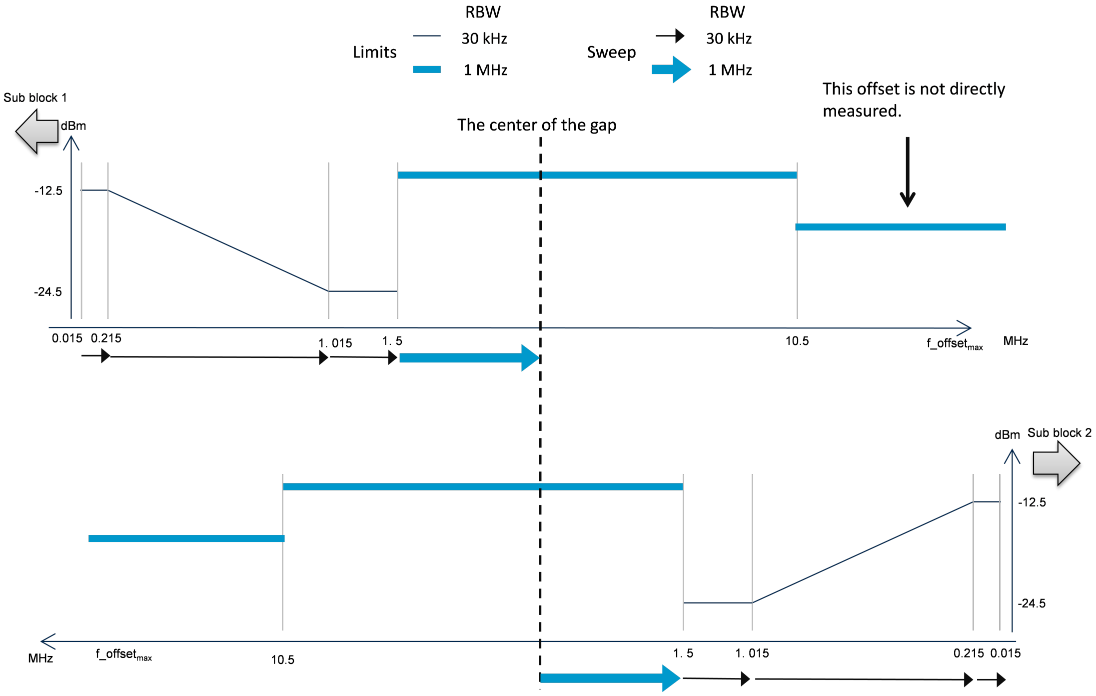
Limits for Inner Offsets

Since inner offsets are defined from the sub-block edges to the gap, limits from two sub-blocks overlap each other. Therefore, the limit used for inner offsets are the cumulative sum of limits from both sub-blocks. Offsets can have different RBWs, which must be compensated when accumulated.

For example, when offset A and D overlap, the limit of offset A is calculated as follows.

$$\text{Cumulated Limit of Offset A} = 10^{\frac{[\text{Offset A Limit in dBm}]}{10}} + \frac{\text{Offset A RBW}}{\text{Offset D RBW}} 10^{\frac{[\text{Offset D Limit in dBm}]}{10}}$$

The diagram below depicts what inner offset limits look like.



Offset (Bandwidth)

Enables you to set up the bandwidth measurement parameters for offset pairs. For example, you can assign the start and stop frequencies, and select the resolution bandwidth.

Offset Freq Define

Enables you to select offset frequency definition. Each standard defines each offset frequency from Carrier.

For example, 3GPP2 requires the “Carrier Center to Meas BW Edge” definition. LTE conformance test requires “Carrier Edge to Meas BW Center” and/or “Carrier Edge to Meas BW Edge” definition. The MSR standard requires “RF BW Edge to Meas BW Center” and/or “RF BW Edge to Meas Edge” definition.

“Meas BW Edge” means the edge frequency of resolution bandwidth closer to the carrier that is represented by Meas BW and Res BW settings. Actual center frequency of Meas BW and the limit line have ½ Meas BW offset when the Meas BW Edge is selected.

Note that the outermost (lowermost, uppermost) carrier at each side is determined by which carrier edge frequency is located outermost within the RF BW or each sub-block bandwidth, instead of which carrier center frequency is located outermost.

See also "Diagrams for Offset Freq Define" on page 856.

Modes other than MSR, LTE-A, 5G NR

Options:

`CTOCenter`	From carrier center to the center of offset measuring filter*
`CTOEdge`	From carrier center to the nominal –3 dB point of the offset measuring filter* closer to the carrier
`ETOCenter`	From Center Frequency – Span of Ref Channel / 2 (for lower offset), Center Frequency + Span of Ref Channel / 2 (for upper offset) of the carrier closest to each offset to the center of offset measuring filter *
`ETOEdge`	From Center Frequency – Span of Ref Channel / 2 (for lower offset), Center Frequency + Span of Ref Channel / 2 (for upper offset) of the carrier closest to each offset to the nominal –3 dB point of the offset measuring filter * closer to the carrier

*Measuring filter = Meas BW (N) x Res BW

** RF BW = $BW_{channel,CA}$ which is defined in each 3GPP standard, regardless of “Measure Carrier” for the uppermost and the lowermost carriers being Enabled or Disabled. When **Number of Component Carriers** = 1, RF BW = $BW_{channel}$ = 2 x $F_{offset,RAT}$

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2:TYPE CTOCenter | CTOEdge | ETOCenter | ETOEdge` `[:SENSe]:SEMask:OFFSet[1]|2:TYPE?`
Example	`:SEM:OFFS:TYPE ETOC` `:SEM:OFFS:TYPE?`
Notes	`OFFSet1` is for BTS, 2 for MS. Default is BTS Note that Offset sub op code 2 is supported only in non-SA Modes. In SA Mode, Offset sub op code 1 is used for both BTS and MS
Preset	`CTOCenter`
State Saved	Saved in instrument state
Range	Carrier Center to Meas BW Center | Carrier Center to Meas BW Edge | Carrier Edge to Meas BW Center | Carrier Edge to Meas BW Edge

Mode: MSR, LTEAFDD, LTEATDD

Options:

`CTOCenter`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the center of offset measuring filter*
`CTOEdge`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the nominal -3 dB point of the

	offset measuring filter* closer to the carrier
`ETOCenter`	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the center frequency of offset measuring filter*
`ETOEdge`	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the nominal -3 dB point of the offset measuring filter* closer to the carrier
`RTOCenter`	From either the lower or upper RF BW** edge frequency to the center frequency of offset measuring filter*
`RTOEdge`	From either the lower or upper RF BW** edge frequency to the nominal -3 dB point of the offset measuring filter* closer to the carrier
`RCTOCenter` 5G NR Mode only	**From the center frequency of RF BW to the center frequency of offset measuring filter***

*Measuring filter = Meas BW (N) x Res BW

** RF BW = $BW_{channel,CA}$ which is defined in each 3GPP standard, regardless of “Measure Carrier” for the uppermost and the lowermost carriers being Enabled or Disabled. When **Number of Component Carriers** = 1, RF BW = $BW_{channel}$ = 2 x $F_{offset,RAT}$

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:TYPE CTOCenter | CTOEdge | ETOCenter | ETOEdge | RTOCenter | RTOEdge` `[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:TYPE?`
Example	`:SEM:OFFS:TYPE ETOC` `:SEM:OFFS:TYPE?`
Notes	`OFFSet1` is for BTS, 2 for MS. Default is BTS
Preset	MSR: `RTOCenter` LTEAFDD, LTEATDD: `ETOCenter`
State Saved	Saved in instrument state
Range	Carrier Center to Meas BW Center|Carrier Center to Meas BW Edge|Carrier Edge to Meas BW Center-|Carrier Edge to Meas BW Edge|RF BW Edge to Meas BW Center|RF BW Edge to Meas BW Edge

Mode: 5G NR

Options: see "Mode: MSR, LTEAFDD, LTEATDD" on page 854 above.

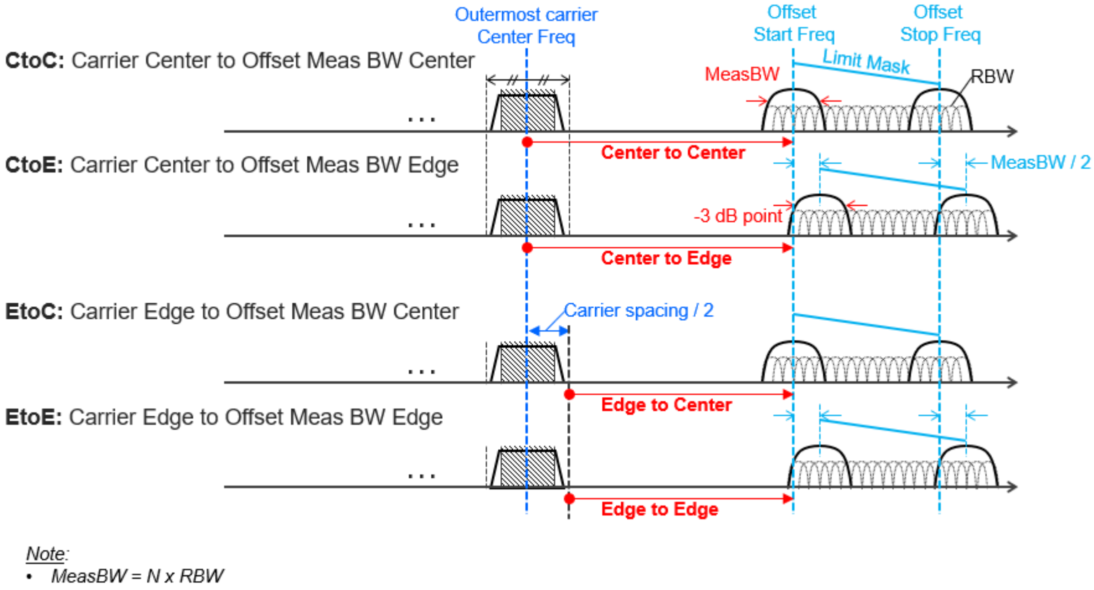
Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:TYPE CTOCenter | CTOEdge | ETOCenter | ETOEdge | RTOCenter | RTOEdge | RCTOCenter` `[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:TYPE?`
Example	`:SEM:OFFS:TYPE ETOC`

	`:SEM:OFFS:TYPE?`
Notes	`OFFSet1` is for BTS, 2 for MS. Default is BTS
Preset	`ETOCenter`
State Saved	Saved in instrument state
Range	Carrier Center to Meas BW Center|Carrier Center to Meas BW Edge|Carrier Edge to Meas BW Center-|Carrier Edge to Meas BW Edge|RF BW Edge to Meas BW Center|RF BW Edge to Meas BW Edge|RF BW Center to Meas BW Center

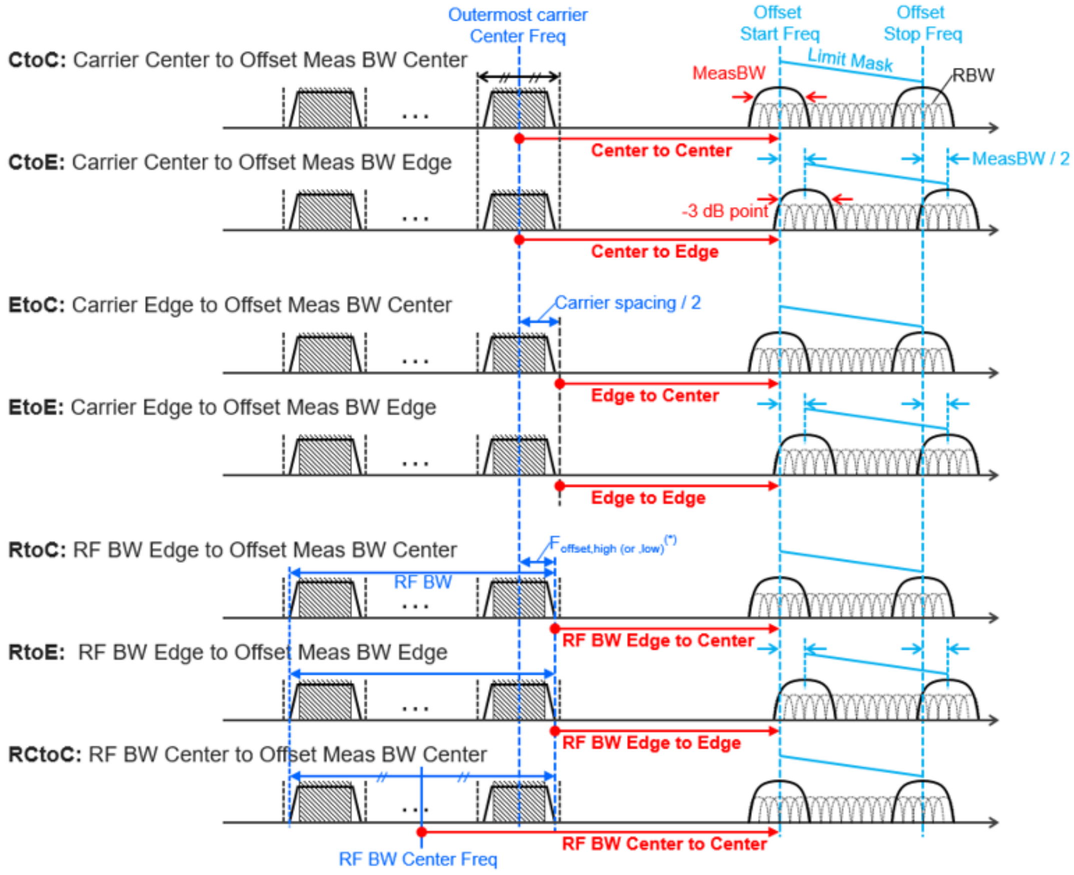
Diagrams for Offset Freq Define

Details depend on the selected mode.

Diagrams for Modes other than MSR, LTEAFDD/LTEATDD, 5G NR



Diagrams for MSR, LTEAFDD/LTEATDD, 5G NR



Notes:
- *MeasBW = N x RBW*
- *RF BW Edge and Outermost Carrier Edge are not always same. e.g.) 5G NR (3GPP) defines BW_channel,CA which calculates F_offset,high and F_offset,low asymmetrically with SCS shift.*
  (*) For MSR, F_offset,high (or ,low) = F_offset,RAT,high (or ,low)

Offset Detector

Enables you to control the detector for offsets. The following choices are available:

`AUTO`	The detector selected depends on marker functions, trace functions, average type, and the trace averaging function
`NORMal`	The detector determines the peak of the CW-like signals, and it yields alternating maximums and minimums of noise-like signals. This is also referred to as Rosenfell detection
`AVERage`	The detector determines the average of the signal within the sweep points. The

	averaging method depends upon the Average Type selection (voltage, power or log scales)
`POSitive` Peak	The detector determines the maximum of the signal within the sweep points
`SAMPle`	The detector indicates the instantaneous level of the signal at the center of the sweep points represented by each display point
`NEGative` Peak	The detector determines the minimum of the signal within the sweep points

<table>
<tr><td>Remote Command</td><td><code>[:SENSe]:SEMask:DETector:OFFSet[:FUNCtion] AVERage | NEGative | NORMal | POSitive | SAMPle</code>
<code>[:SENSe]:SEMask:DETector:OFFSet[:FUNCtion]?</code>
<code>[:SENSe]:SEMask:DETector:OFFSet:AUTO ON | OFF | 1 | 0</code>
<code>[:SENSe]:SEMask:DETector:OFFSet:AUTO?</code></td></tr>
<tr><td>Example</td><td><code>:SEM:DET:OFFS AVER</code>
<code>:SEM:DET:OFFS?</code>
<code>:SEM:DET:OFFS:AUTO OFF</code>
<code>:SEM:DET:OFFS:AUTO?</code></td></tr>
<tr><td>Notes</td><td>When you manually select a detector (instead of selecting Auto), that detector is used regardless of other instrument settings
Note that this detector setting affects all offsets; there is no per-trace detector</td></tr>
<tr><td>Couplings</td><td>See Couplings in "Trace Type" on page 2137</td></tr>
<tr><td>Preset</td><td><code>POSitive</code>
<code>ON</code></td></tr>
<tr><td>State Saved</td><td>Saved in instrument state</td></tr>
<tr><td>Range</td><td><code>AVERage|NEGative|NORMal|POSitive|SAMPle</code></td></tr>
</table>

Offset Average Type (Remote Command Only)

Select trace average type for the offsets.

<table>
<tr><td>Remote Command</td><td><code>[:SENSe]:SEMask:AVERage:OFFSet:TYPE RMS | LOG</code>
<code>[:SENSe]:SEMask:AVERage:OFFSet:TYPE?</code></td></tr>
<tr><td>Example</td><td><code>:SEM:AVER:OFFS:TYPE LOG</code>
<code>:SEM:AVER:OFFS:TYPE?</code></td></tr>
<tr><td>Preset</td><td><code>RMS</code></td></tr>
<tr><td>State Saved</td><td>Saved in instrument state</td></tr>
</table>

Start Freq

Specifies the start frequency for the currently selected offset. Also enables you to toggle that offset between On and Off.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values will remain unchanged. The query for this parameter returns 14 values for WLAN mode, 12 values for other modes.

Remote Command

```
[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:FREQuency:STARt <freq>, …
[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:FREQuency:STARt?
[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:STATe ON | OFF | 1 | 0, …
[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:STATe?
```

Example

```
:SEM:OFFS2:LIST:FREQ:STAR 2.515 MHz, 2.715 MHz, 3.515 MHz, 4.00 MHz, 8.00
MHz, 12.50 MHz
:SEM:OFFS2:LIST:FREQ:STAR?
:SEM:OFFS:LIST:STAT ON, ON, ON, OFF, OFF, OFF
:SEM:OFFS:LIST:STAT?
```

Notes

Comma-separated list of values

`OFFSet1` is for BTS, 2 for MS. Default is BTS

Note that Offset sub op code 2 is supported only in non-SA Modes. In SA Mode, Offset sub op code 1 is used for both BTS and MS

If the offset is outside of the frequency range, the result spectrum will be invalid

Couplings

Coupled to Stop Freq. When the start freq goes above the stop freq, the stop freq is automatically adjusted to the start freq plus 100 Hz

Preset

When the max number of offsets is 6:

Mode	Values
SA	2.515 MHz, 2.715 MHz, 3.515 MHz, 4.00 MHz, 8.00 MHz, 12.50 MHz
WCDMA	2.515 MHz, 2.715 MHz, 3.515 MHz, 4.000 MHz, 8.000 MHz, 12.50 MHz|2.515MHz, 4.000 MHz, 7.500 MHz, 8.500 MHz, 12.5 MHz, 15 MHz

When the max number of offsets is 12 in these modes, the preset value of Offset G ~ L is the same as the Offset F value

Mode	Values
MSR	15 kHz, 215kHz, 1.015MHz, 1.5MHz, 10.5MHz, 15.00MHz, 30MHz, 30MHz, 30MHz, 30MHz, 30MHz, 30MHz | 15kHz, 215kHz, 1.015MHz, 1.5MHz, 10.5MHz, 15.00MHz, 30MHz, 30MHz, 30MHz, 30MHz, 30MHz, 30MHz
LTEAFDD,	50 kHz, 5.05 MHz, 10.5 MHz, 15.00 MHz, 30 MHz, 40 MHz, 40 MHz,40 MHz, 40

Mode	Values
LTEATDD	MHz,40 MHz, 40 MHz, 40 MHz | 15.00 kHz,1.5 MHz, 5.5 MHz, 6.5 MHz, 10 MHz, 20MHz, 20MHz, 20MHz, 20MHz, 20MHz, 20MHz, 20MHz
5G NR	50 kHz, 5.05 MHz, 10.5 MHz, 40.00 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz | 15.00 kHz, 1.5 MHz, 5.5 MHz, 100.50 MHz, 105.00 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz

When the max number of offsets is 14 in these modes, the preset value of Offset G ~ N is the same as the Offset F value

`WLAN` Mode: See the table of "WLAN Mode Presets" on page 860 below

When the max number of offsets is 6:

Mode	Values
SA	`ON, ON, ON, ON, ON, OFF`
WCDMA	`ON, ON, ON, ON, ON, OFF | ON, ON, ON, ON, OFF, OFF`

When the max number of offsets is 12 in these modes, the preset value of Offset G ~ L is the same as the Offset F value

MSR	`ON, ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF | ON, ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF`
LTEAFDD, LTEATDD	`ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF | ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF`
5G NR	`ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF | ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF`

When the max number of offsets is 14 in these modes, the preset value of Offset G ~ N is the same as the Offset F value

Mode	Values
WLAN	See the table of "WLAN Mode Auto Function Presets" on page 862 below

State Saved	Saved in instrument state Saved in instrument state

802.11af(8MHz)	3.8 MHz, 4.2 MHz, 8 MHz, 12 MHz, 12 MHz, 12 MHz, 12 MHz, 12 MHz, 12 MHz, 12 MHz, 12 MHz, 12 MHz, 12 MHz, 12 MHz
802.11be (320MHz)	159.5 MHz, 160.5 MHz, 320 MHz, 480 MHz, 490 MHz, 490 MHz, 490 MHz, 490 MHz, 490MHz, 490 MHz, 490 MHz, 490 MHz, 490 MHz, 490 MHz

WLAN Mode Auto Function Presets

For X Series:

Radio Std	Presets
802.11b/g(DSSS/CCK/PBCC)	`ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF`
802.11a/g/j/p 20MHz (OFDM/DSSS-OFDM) 802.11j/p 10MHz 802.11p 5MHz/802.11n (20MHz/40MHz)	`ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF`
802.11ac/ax/be (20 MHz/ 40 MHz/ 80 MHz/ 160 MHz)	`ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF`
802.11be (320 MHz)	`ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF`
802.11ac/ax (80 MHz + 80 MHz)	`OFF, ON, ON, ON, ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF`
802.ah (1MHz/ 2MHz/ 4MHz/ 8MHz/ 16MHz)	`ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF`
802.11af (6 MHz/ 7 MHz/ 8 MHz)	`ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF`

For E6630A, E6640A, and M90XA:

Radio Std	Presets
802.11a/g(OFDM/DSSS-OFDM) 802.11n(20MHz/40MHz)	`ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF`
802.11ac/ax/be (20 MHz/ 40 MHz/ 80 MHz/ 160 MHz)	`ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF`
802.11be (320 MHz)	`ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF`
802.11ac/ax (80 MHz + 80 MHz)	`ON, ON, ON, OFF, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF`
802.11af (6 MHz/ 7 MHz/ 8 MHz)	`ON, ON, ON, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF`

Stop Freq

Specifies the stop frequency for the currently selected offset.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values will remain unchanged. The query for this parameter returns 14 values for WLAN mode, 12 values for other modes.

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:FREQuency:STOP <freq>, …` `[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:FREQuency:STOP?`
Example	`:SEM:OFFS:LIST:FREQ:STOP 2.715 MHz, 3.515 MHz, 4.00 MHz, 8.00 MHz, 12.50 MHz, 15.0 MHz` `:SEM:OFFS:LIST:FREQ:STOP?`
Notes	Comma separated list of values `OFFSet1` is for BTS, 2 for MS. Default is BTS Note that Offset sub op code 2 is supported only in non-SA Modes. In SA Mode, Offset sub op code 1 is used for both BTS and MS If the offset is outside of the frequency range, the result spectrum will be invalid
Couplings	Coupled to Start Freq. When Stop Freq goes below Start Freq, Start Freq is automatically adjusted to Stop Freq minus 100 Hz
Preset	When the max number of offsets is 6:

Mode	Values
SA	2.715 MHz, 3.515 MHz, 4.00 MHz, 8.00 MHz, 12.50 MHz, 15.0 MHz
WCDMA	2.715 MHz, 3.515 MHz, 4.000 MHz, 8.000 MHz, 12.50 MHz, 15.0 MHz|3.485 MHz, 7.500 MHz, 8.500 MHz, 12.00 MHz, 15.00 MHz, 18.0 MHz

When the max number of offsets is 12 in these modes, the preset value of Offset G ~ L is the same as the Offset F value

Mode	Values
MSR	215 kHz, 1.015 MHz, 1.5 MHz, 10.5 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz|215 kHz, 1.015 MHz, 1.5 MHz, 10.5 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz
LTEAFDD, LTEATDD	5.05 MHz, 10.05 MHz, 15 MHz, 30 MHz, 40 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz, 50 MHz | 985.0 kHz, 4.50 MHz, 5.5001 MHz, 9.50 MHz, 20 MHz, 40 MHz, 40 MHz, 40 MHz, 40 MHz, 40 MHz, 40 MHz, 40 MHz
5G NR	5.05 MHz, 10.05 MHz, 40 MHz, 100 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz | 985.0 kHz, 4.50 MHz, 99.500 MHz, 104.5 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz, 500 MHz

When the max number of offsets is 14 in these modes, the preset value of Offset G ~ N is the same as

	the Offset F value **WLAN Mode**: See table of "WLAN Mode Presets" on page 864 below
State Saved	Saved in instrument state
Min/Max	100 Hz/Depends on instrument maximum frequency. Same as the Max Span in Swept SA Measurement

802.11af (6MHz)	3.15MHz, 6 MHz, 9 MHz, 15MHz, 15 MHz, 15 MHz, 15 MHz, 15 MHz, 15 MHz, 15 MHz, 15 MHz, 15 MHz, 15 MHz, 15 MHz
802.11af (7MHz)	3.675 MHz, 7 MHz, 10.5 MHz, 17.5MHz, 17.5 MHz, 17.5 MHz, 17.5 MHz, 17.5 MHz, 17.5 MHz, 17.5 MHz, 17.5 MHz, 17.5 MHz, 17.5 MHz, 17.5 MHz
802.11af (8MHz)	4.2 MHz, 8 MHz, 12 MHz, 20 MHz, 20 MHz, 20 MHz, 20 MHz, 20 MHz, 20 MHz, 20 MHz, 20 MHz, 20 MHz, 20 MHz, 20 MHz
802.11be (320MHz)	160.5 MHz, 320 MHz, 480 MHz, 490 MHz, 800 MHz, 800 MHz, 800 MHz, 800 MHz, 800 MHz, 800 MHz, 800 MHz, 800 MHz, 800 MHz, 800 MHz

Res BW

Specifies which Resolution BW filter to use when measuring the currently selected offset.

Offset Res BW Mode allows the instrument to determine the optimum Resolution BW filter to use when measuring the currently selected offset.. When changing the Meas BW parameter, if the Res BW needs to be changed to adhere to the rule:

(N x Res BW) <= (Stop freq of the offset - Start freq of the offset),

where N is the multiplier, this setting will automatically be changed to manual.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values will remain unchanged. The query for this parameter returns 14 values for WLAN mode, 12 values for other modes.

Remote Command

```
[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:BANDwidth[:RESolution] <bandwidth>, …
```

```
[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:BANDwidth[:RESolution]?
```

```
[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:BANDwidth[:RESolution]:AUTO OFF | ON | 1 | 0, …
```

	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:BANDwidth[:RESolution]:AUTO?`

Example	`:SEM:OFFS2:LIST:BAND 30.0 kHz, 30.0 kHz, 30.0 kHz, 1.00 MHz,1.00 MHz, 1.00 MHz`
	`:SEM:OFFS2:LIST:BAND?`
	`:SEM:OFFS:LIST:BAND:AUTO 1,1,1,1,1,1`
	`:SEM:OFFS:LIST:BAND:AUTO?`

Notes	Comma separated list of values `OFFSet1` is for BTS, 2 for MS. Default is BTS Note that Offset sub op code 2 is supported only in non-SA modes. In the SA mode, Offset sub op code 1 is used for both BTS and MS
Couplings	Coupled to Start and Stop offset and Meas BW multiplier. This parameter must adhere to the rule (N x Res BW) <= (Stop freq of the offset - Start freq of the offset), where N is the multiplier. If the multiplier is changed, the Res BW will change to ensure this. When set manually, Res BW Coupling is set to manual The resolution bandwidth is coupled to the offset width determined by the start frequency and stop frequency

Preset

When the max number of offsets is 6:

Mode	Values
SA	30.0 kHz, 30.0 kHz, 30.0 kHz, 1.00 MHz,1.00 MHz, 1.00 MHz
WCDMA	30.00 kHz, 30.00 kHz, 30.00 kHz, 100.00 kHz, 1.000 MHz, 1.00 MHz|30.00 kHz, 1.000 MHz, 1.000 MHz, 1.000 MHz, 1.000 MHz, 1.00 MHz

When the max number of offsets is 12 in these modes, the preset value of Offset G ~ L is the same as the Offset F value

Mode	Values
LTEAFDD, LTEATDD, 5G NR	51 kHz, 100 kHz, 1.0 MHz, 1.0 MHz, 1.0 MHz, 1.0 MHz, 1.0 MHz, 1.0 MHz, 1.0 MHz, 1.0 MHz, 1.0 MHz, 1.0 MHz | 15.0 kHz, 510 kHz, 1.0 MHz, 1.0 MHz, 1.0 MHz, 1.0 MHz, 1.0 MHz, 1.0 MHz, 1.0 MHz, 1.0 MHz, 1.0 MHz, 1.0 MHz
MSR	30kHz, 30kHz, 30kHz, 1.0MHz,1.0MHz, 1.0MHz, 1.0MHz, 1.0MHz, 1.0MHz, 1.0MHz, 1.0MHz, 1.0MHz | 30kHz, 30kHz, 30kHz, 1.0MHz,1.0MHz, 1.0MHz, 1.0MHz, 1.0MHz, 1.0MHz, 1.0MHz, 1.0MHz,1.0MHz

When the max number of offsets is 14 in these modes, the preset value of Offset G ~ N is the same as the Offset F value

Mode	Values
WLAN	100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz

When the max number of offsets is 6:

`OFF, OFF, OFF, OFF, OFF, OFF | OFF, OFF, OFF, OFF, OFF, OFF`

When the max number of offsets is 12:

`OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF | OFF, OFF, OFF,`

	`OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF`
	When the max number of offsets is 14:
	`OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF | OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF`

State Saved	Saved in instrument state Saved in instrument state
Range	Auto|Man
Min	1 Hz
Max	Option FS1 or FS2 is installed: 10 MHz Otherwise: 8 MHz
Backwards Compatibility SCPI	`[:SENSe]:SEMask:OFFSet[1]|2:LIST:BWIDth[:RESolution]` `[:SENSe]:SEMask:OFFSet[1]|2:LIST:BWIDth[:RESolution]:AUTO`

Meas BW

Allows you to specify a multiplier of Res BW for the measurement integration bandwidth.

Meas BW is multiplier integer number. It shows a ratio between Integration BW and Resolution BW of the measurement result.

Integ BW = Meas BW * Resolution BW

Integration BW is desired resolution bandwidth and Resolution BW is actual bandwidth for sweep. Measurement sweeps with Resolution BW and Meas BW compensates sweep resolution bandwidth to Integration BW.

If you set this value greater than 1, you can set Resolution BW narrower to avoid carrier power leakage effect to the offset power integration.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values will remain unchanged. The query for this parameter returns 14 values for WLAN mode, 12 values for other modes.

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:IMULti <integer>, …` `[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:IMULti?`
Example	`:SEM:OFFS2:LIST:BAND:IMUL 1,1,1,1,1,1` `:SEM:OFFS2:LIST:BAND:IMUL?`
Notes	Comma separated list of values `OFFSet1` is for BTS, 2 for MS. Default is BTS Note that Offset sub op code 2 is supported only in non-SA modes. In the SA mode, Offset sub op code 1 is used for both BTS and MS

Preset

When the max number of offsets is 6:

Mode	Values
SA	1, 1, 1, 1, 1, 1
WCDMA	1, 1, 1, 10, 1, 1|1, 1, 1, 1, 1, 1

When the max number of offsets is 12 in these modes, the preset value of Offset G ~ L is the same as the Offset F value

Mode	Values
MSR	1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1|1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1
LTEAFDD, LTEATDD, 5G NR	2, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1|2, 2, 1, 1, 1,1, 1, 1, 1, 1, 1, 1

When the max number of offsets is 14in these modes, the preset value of Offset G ~ N is the same as the Offset F value

Mode	Values
WLAN	1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1

State Saved	Yes
Min/Max	1/1000
Backwards Compatibility SCPI	`[:SENSe]:SEMask:OFFSet[1]|2:LIST:BWIDth:IMULti`

Video BW

Changes the instrument post-detection filter.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values will remain unchanged. The query for this parameter returns 14 values for WLAN mode, 12 values for other modes.

Remote Command

```
[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:VIDeo <freq>, …
[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:VIDeo?
[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:VIDeo:AUTO OFF | ON | 0 |
1, …
[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:VIDeo:AUTO?
```

Example

```
:SEM:OFFS2:LIST:BAND:VID 3.00 kHz, 3.00 kHz, 3.00 kHz, 100.0 kHz,100.0 kHz,
100.0 kHz
:SEM:OFFS2:LIST:BAND:VID?
:SEM:OFFS2:LIST:BAND:VID:AUTO ON, ON, ON, ON, ON, ON
:SEM:OFFS2:LIST:BAND:VID:AUTO?
```

Notes	Comma separated list of values `OFFSet1` is for BTS, 2 for MS. Default is BTS Note that Offset sub op code 2 is supported only in non-SA modes. In the SA mode, Offset sub op code 1 is used for both BTS and MS

Preset	Automatically Calculated
	When the max number of offsets is 6:
	`ON, ON, ON, ON, ON, ON | ON, ON, ON, ON, ON, ON`
	When the max number of offsets is 12:
	`ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON | ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON`
	When the max number of offsets is 14:
	`ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON`

State Saved	Saved in instrument state Saved in instrument state
Range	Auto|Man
Min/Max	1 Hz/50 MHz
Backwards Compatibility SCPI	`[:SENSe]:SEMask:OFFSet[1]|2:LIST:BWIDth:VIDeo` `[:SENSe]:SEMask:OFFSet[1]|2:LIST:BWIDth:VIDeo:AUTO`

VBW/RBW

Selects the ratio between the video and resolution bandwidths.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values will remain unchanged. The query for this parameter returns 14 values for WLAN mode, 12 values for other modes.

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:VIDeo:RATio <real>, …`
	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:VIDeo:RATio?`
	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:VIDeo:RATio:AUTO OFF | ON | 0 | 1, …`
	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:VIDeo:RATio:AUTO?`

Example	`:SEM:OFFS2:LIST:BAND:VID:RAT 0.1, 0.1, 0.1, 0.1, 0.1, 0.1`
	`:SEM:OFFS2:LIST:BAND:VID:RAT?`
	`:SEM:OFFS2:LIST:BAND:VID:RAT:AUTO ON, ON, ON, ON, ON, ON`
	`:SEM:OFFS2:LIST:BAND:VID:RAT:AUTO?`

Notes	Comma separated list of values `OFFSet1` is for BTS, 2 for MS. Default is BTS

	Note that Offset sub op code 2 is supported only in non-SA modes. In the SA mode, Offset sub op code 1 is used for both BTS and MS

Preset	**Modes other than LTEAFDD, LTEATDD, 5G NR, MSR, WLAN:**
	When the max number of offsets is 6:
	0.01, 0.01, 0.01, 0.01, 0.01, 0.01|0.01, 0.01, 0.01, 0.01, 0.01, 0.01
	When the max number of offsets is 12, the preset value of Offset G ~ L is the same as the Offset F value
	LTEAFDD, LTEATDD, 5G NR, MSR Modes:
	0.01, 0.01, 0.01, 0.01, 0.01, 0.01, 0.01, 0.01, 0.01, 0.01, 0.01, 0.01|0.01, 0.01, 0.01, 0.01, 0.01, 0.01, 0.01, 0.01, 0.01, 0.01, 0.01, 0.01
	When the max number of offsets is 14 in these modes, the preset value of Offset G ~ N is the same as the Offset F value
	WLAN Mode:

Offset (Sweep)

Accesses a menu that enables you to set up the sweep measurement parameters for offset pairs.

Offset Freq Define

Same as "Offset Freq Define" on page 853 under Offset (Bandwidth).

Offset Detector

Same as "Offset Detector" on page 857 under Offset (Bandwidth).

Start Freq

Same as "Start Freq" on page 859 under Offset (Bandwidth).

Stop Freq

Same as "Stop Freq" on page 863 under Offset (Bandwidth).

Sweep Time

Specifies the **Sweep Time** for the currently selected offset and enables you to toggle the Sweep Time mode between Auto and Man.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values will remain unchanged. The query for this parameter returns 14 values for WLAN mode, 12 values for other modes.

NOTE

On non-sweeping hardware, this column is grayed out. The value shown on this column is an estimate. It is the turnaround time to complete the measurement of the entire offset span, which is the sum of signal acquisition time, FFT time, and other overhead time. If you need to specify the same “Sweep Time” as you would for sweeping hardware, send `[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:SWEep:TIME <time>`. The measurement emulates the “Sweep Time” effect, but this emulation is not straightforward, and therefore the behavior is not specified. Instead, we recommend using **Minimum Acquisition Time**, which provides better control.

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:SWEep:TIME <time>, …`
	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:SWEep:TIME?`
	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:SWEep:TIME:AUTO ON | OFF | 1 | 0, …`
	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:SWEep:TIME:AUTO?`

Example	`:SEM:OFFS2:LIST:SWE:TIME 1.0 ms, 3.4 ms, 2.08 ms, 1.0 ms, 1.0 ms, 1.0 ms`
	`:SEM:OFFS2:LIST:SWE:TIME?`
	`:SEM:OFFS2:LIST:SWE:TIME:AUTO ON, ON, ON, ON, OFF, OFF`
	`:SEM:OFFS2:LIST:SWE:TIME:AUTO?`

Notes	Comma separated list of values `OFFSet1` is for BTS, 2 for MS. Default is BTS Note that Offset sub op code 2 is supported only in non-SA modes. In the SA mode, Offset sub op code 1 is used for both BTS and MS
Dependencies	On non-sweeping hardware, this column is grayed out and the Auto/Man checkbox is invisible. The read-only value shows the estimated sweep time In those instruments, "Minimum Acquisition Time" on page 872 is available
Couplings	When you manually set a value when in the Auto state, the state automatically changes to Man

Preset	Automatically calculated
	Modes other than LTEAFDD, LTEATDD, 5G NR, MSR, WLAN:
	When the max number of offsets is 6:
	`ON,ON,ON,ON,ON,ON`
	When the max number of offsets is 12:
	`ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON`
	Modes LTEAFDD, LTEATDD, 5G NR, MSR:
	`ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON | ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON`
	When the max number of offsets is 14:
	Mode WLAN:
	`ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON`

State Saved	Saved in instrument state Saved in instrument state
Range	Auto|Man
Min	Other than non-sweeping hardware Depends on Sweep Type: – Sweep Type “Swept”: 1 ms – Sweep Type “FFT”: 100 ns Non-sweeping hardware: N/A
Max	Other than non-sweeping hardware: 4000 s Non-sweeping hardware: N/A
Backwards Compatibility SCPI	`[:SENSe]:SEMask:OFFSet[1]|2:LIST:SWEep[:TIME]` `[:SENSe]:SEMask:OFFSet[1]|2:LIST:SWEep[:TIME]:AUTO`

Minimum Acquisition Time

Available on non-sweeping hardware.

Specifies the minimum acquisition time for each “chunk” of the measurement result. The instrument automatically divides Span into multiple chunks if needed.

Therefore, the total signal acquisition time for the entire offset span is ~(>~Minimum Acquisition Time) * (The number of chunks).

When in Auto, this parameter’s value is determined by other parameters, such as Offset Start, Offset Stop, RBW and VBW.

You can manually increase this parameter value from this Auto value.

If increased, the instrument acquires signal for the specified time duration for each chunk. It performs additional FFTs, and averages or peak-holds the FFT results for a chunk, depending on Detector settings.

Note that the actual acquisition time for each chunk may exceed the Minimum Acquisition Time value, in order to satisfy FFT time required by other parameters, and to perform an integer number of FFTs.

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:SWEep:ACQuisition:TIME <time>, …`
	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:SWEep:ACQuisition:TIME?`
	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:SWEep:ACQuisition:TIME:AUTO ON | OFF | 1 | 0, …`
	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:SWEep:ACQuisition:TIME:AUTO?`

Example	`:SEM:OFFS2:LIST:SWE:ACQ:TIME 1.0 ms, 3.4 ms, 2.08 ms, 1.0 ms, 1.0 ms, 1.0 ms`
	`:SEM:OFFS2:LIST:SWE:ACQ:TIME?`
	`:SEM:OFFS2:LIST:SWE:ACQ:TIME:AUTO ON, ON, ON, ON, OFF, OFF`
	`:SEM:OFFS2:LIST:SWE:ACQ:TIME:AUTO?`

Dependencies	Available only on non-sweeping hardware
Couplings	Coupled to Offset Start Freq, Offset Stop Freq, RBW, and VBW when in the Auto state When you manually set a value when in the Auto state, the state automatically changes to Man
Preset	Automatically calculated `ON`
State Saved	Saved in instrument state
Min	100 ns
Max	4000 s

Sweep Time Annotation (Remote Query Only)

Returns the Sweep Time Annotation value. Available only on non-sweeping hardware.

The value returned is the estimated turnaround time of each acquisition, in seconds. The turnaround time is the sum of the signal acquisition time, FFT time, and other overhead time, to complete the entire offset span of each measurement cycle.

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:SWEep:ETIMe?`

Example	`:SEM:OFFS2:LIST:SWE:ETIM?`
Dependencies	Available only on non-sweeping hardware
Preset	Automatically calculated

Sweep Type

Specifies the **Sweep Type** for the currently selected offset, and enables you to toggle the **Sweep Type** mode between **Auto** and **Man**.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values will remain unchanged. The query for this parameter returns 14 values for WLAN mode, 12 values for other modes.

How to define Sweep Time and Sweep Type:

Sweep Type mode	Behavior
Auto	**Sweep Type** is automatically selected according to "Sweep Type Rules" on page 850 **Sweep Time** is automatically calculated according to the selected **Sweep Type**
Man	**Sweep Type** is user-selected

–

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:SWEep:TYPE SWEep | FFT, …`
	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:SWEep:TYPE?`
	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:SWEep:TYPE:AUTO ON | OFF | 1 | 0, …`
	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:SWEep:TYPE:AUTO?`

Example	`:SEM:OFFS2:LIST:SWE:TYPE FFT,FFT,SWE`
	`:SEM:OFFS2:LIST:SWE:TYPE?`
	`:SEM:OFFS2:LIST:SWE:TYPE:AUTO ON, ON, ON, ON, OFF, OFF`
	`:SEM:OFFS2:LIST:SWE:TYPE:AUTO?`

Notes	Comma-separated list of values `OFFSet1` is for BTS, 2 for MS. Default is BTS Note that Offset sub op code 2 is supported only in non-SA Modes In SA Mode, Offset sub op code 1 is used for both BTS and MS
Dependencies	Not available in modular products, such as VXT
Couplings	When **Sweep Type** is set manually, Sweep Type mode is set to `OFF` (**Manual**) When **Sweep Type** mode is **Auto**, **Sweep Type** is automatically selected according to **Sweep Type Rules**

Preset	Automatically calculated
	LTEAFDD, LTEATDD, 5G NR, MSR Modes:
	`ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON|`
	`ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON`
	When the max number of offsets is 14:
	WLAN Mode:
	`ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON`
	All Other Modes:
	When the max number of offsets is 6:
	`ON,ON,ON,ON,ON,ON`
	When the max number of offsets is 12:
	`ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON`

State Saved	Saved in instrument state
Range	Auto|Man

Offset Side

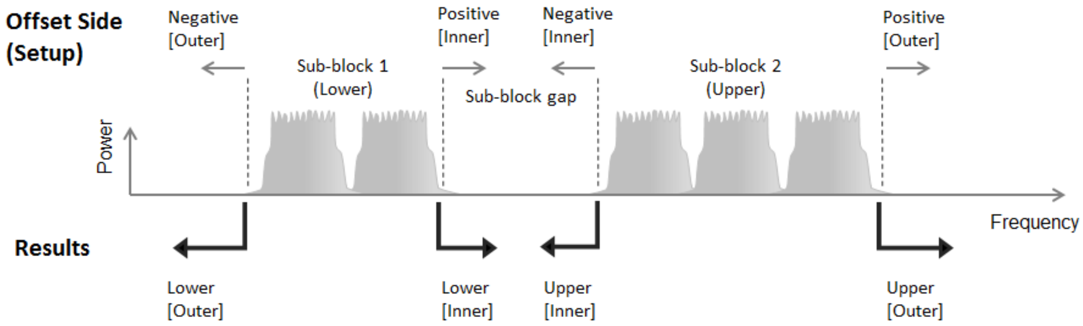
Specifies which offset side to measure.

You can turn off (not use) specific offsets with `[:SENSe]:SEMask:OFFSet[n][:OUTer]:LIST:STATe`.

`BOTH`	Both of the negative (lower) and positive (upper) sidebands
`NEGative`	Negative (lower) sideband only
`POSitive`	Positive (upper) sideband only

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query returns 14 values for WLAN Mode, and 12 values for other Modes.

The figure below shows the relation between the negative/positive offset side setups and the upper/lower results in the MSR, LTE-Advanced FDD/TDD and 5G NR Modes.



Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:SIDE BOTH | NEGative | POSitive, …` `[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:SIDE?`
Example	`:SEM:OFFS:LIST:SIDE BOTH, NEG, NEG, POS, POS, POS` `:SEM:OFFS:LIST:SIDE?`
Notes	Comma-separated list of values `OFFSet1` is for BTS, 2 for MS. Default is BTS Note that Offset sub op code 2 is supported only in Modes other than SA. In SA Mode, Offset sub op code 1 is used for both BTS and MS

Preset	**Modes LTEAFDD,LTEATDD, 5G NR, MSR:**
	`BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH | BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH`
	When the max number of offsets is 14:
	Mode WLAN:
	`BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH`
	All Other Modes:
	When the max number of offsets is 6:
	`BOTH, BOTH, BOTH, BOTH, BOTH, BOTH`
	When the max number of offsets is 12:
	`BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH, BOTH`

State Saved	Saved in instrument state
Range	`BOTH|NEGative|POSitive`

Limits

Enables you to set the power limits for start and stop frequencies of the selected offsets.

Start Freq

Same as "Start Freq" on page 859 under **Offset (Bandwidth)**.

Stop Freq

Same as "Stop Freq" on page 863 under **Offset (Bandwidth)**.

Abs Start

Sets the absolute power level limit at the start frequency for the selected offset. The absolute power level limit ranges from –200 to +50 dBm.

The fail condition for each offset channel is set remotely by `[:SENSe]:SEMask:OFFSet[n][:OUTer]:LIST:TEST`.

You can turn off (not use) specific offset channels remotely with `[:SENSe]:SEMask:OFFSet[n][:OUTer]:LIST:STATe`.

The query returns values currently set to the absolute power test limits.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query returns 14 values for WLAN Mode, or 12 values for other Modes.

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:STARt:ABSolute <real>, …` `[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:STARt:ABSolute?`
Example	`:SEM:OFFS2:LIST:STAR:ABS -12.50 dBm, -12.50 dBm, -24.50 dBm, -11.50 dBm, -11.50 dBm, -11.50 dBm` `:SEM:OFFS2:LIST:STAR:ABS?`
Notes	Comma-separated list of values `OFFSet1` is for BTS, 2 for MS. Default is BTS Note that Offset sub op code 2 is supported only in non-SA modes. In SA Mode, Offset sub op code 1 is used for both BTS and MS
Preset	When the max number of offsets is 6:

Mode	Values
SA	-14.00 dBm , -14.00 dBm , -26.00 dBm , -13.00 dBm , -13.00 dBm, -13.00 dBm
WCDMA	-12.50 dBm, -12.50 dBm, -24.50 dBm, -11.50 dBm, -11.50 dBm, -11.50 dBm|-69.6 dBm, -54.3 dBm, -54.3 dBm, -54.3 dBm, -54.3 dBm, -54.3 dBm
LTE, LTETDD	-5.5 dBm, -12.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm|-13.5 dBm, -8.5 dBm, -11.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm

When the max number of offsets is 12 in these modes, the preset value of Offset G ~ L is the same as the Offset F value

Mode	Values
LTEAFDD, LTEATDD	-5.5 dBm, -12.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm|-13.5 dBm, -8.5 dBm, -11.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm
5G NR	-5.5 dBm, -12.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm|-22.5 dBm, -8.5 dBm, -11.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm
MSR	-12.5 dBm, -12.5 dBm, -24.5 dBm, -11.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm| -12.5 dBm, -12.5 dBm, -24.5 dBm, -11.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm

When the max number of offsets is 14 in these Modes, the preset value of Offset G ~ N is the same as the Offset F value

Abs Stop

Sets the absolute power level limit at the stop frequency for the selected offset. The absolute power level limit ranges from –200 to +50 dBm. You can also toggle this function between **Couple** (`COUPle` = `ON`) and **Manual** (`COUPle` = `OFF`). If set to **Couple**, the **Abs Stop** power level limit is coupled to **Abs Start** to result in a flat limit line. If set to **Man**, Abs Start and Abs Stop take different values, resulting in a sloped limit line.

The query returns values currently set to the offset stop absolute power limits.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query returns 14 values for WLAN Mode, or 12 values for other Modes.

Remote Command

```
[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:STOP:ABSolute <real>, …
[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:STOP:ABSolute?
[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:STOP:ABSolute:COUPle ON | OFF | 1 |
0, …
[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:STOP:ABSolute:COUPle?
```

Example

```
:SEM:OFFS:LIST:STOP:ABS -12.50 dBm, -24.50 dBm, -24.50 dBm, -11.50 dBm, -
11.50 dBm, -11.50 dBm
:SEM:OFFS1:LIST:STOP:ABS?
:SEM:OFFS:LIST:STOP:ABS:COUP ON, OFF, ON, ON, ON, ON
:SEM:OFFS:LIST:STOP:ABS:COUP?
```

Notes

Comma-separated list of values

OFFSet 1 is for BTS, 2 for MS. Default is BTS

Note that Offset sub op code 2 is supported only in Modes other than SA. In SA Mode, Offset sub op code 1 is used for both BTS and MS

Couplings

Coupled to **Abs Start** if **Auto** is selected, that is, the Stop value is equal to the Start value

Preset

When the max number of offsets is 6:

Mode	Values
SA	-14.00 dBm, -26.00 dBm, -26.00 dBm, -13.00 dBm, -13.00 dBm, -13.00 dBm
WCDMA	-12.50 dBm, -24.50 dBm, -24.50 dBm, -11.50 dBm, -11.50 dBm, -11.50 dBm|-69.6 dBm, -54.3 dBm, -54.3 dBm, -54.3 dBm, -54.3 dBm, -54.3 dBm
LTE, LTETDD	-12.5 dBm, -12.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm| -13.5 dBm, -8.5 dBm, -11.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm

When the max number of offsets is 12 in these modes, the preset value of Offset G ~ L is the same as the Offset F value

Mode	Values
LTEAFDD, LTEATDD	-12.5 dBm, -12.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm| -13.5 dBm, -8.5 dBm, -11.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm
5G NR	-12.5 dBm, -12.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm| -22.5 dBm, -8.5 dBm, -11.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm
MSR	-12.5 dBm, -24.5 dBm, -11.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm| -12.5 dBm, -24.5 dBm, -11.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm

When the max number of offsets is 14 in these modes, the preset value of Offset G ~ N is the same as the Offset F value

WLAN Mode: See the table of "WLAN Mode Presets" on page 881 below

When the max number of offsets is 6:

Mode	Values
SA	ON, OFF, ON, ON, ON, ON
WCDMA	ON, OFF, ON, ON, ON, ON | ON, ON, ON, ON, ON, ON
LTE, LTETDD	OFF, ON, ON, ON, ON, ON | ON, ON, ON, ON, ON, ON

When the max number of offsets is 12 in these modes, the preset value of Offset G ~ L is the same as the Offset F value

Mode	Values
LTEAFDD, LTEATDD, 5G NR	OFF, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON | ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON
MSR	ON, OFF, OFF, OFF, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF | ON, OFF, OFF, OFF, ON, OFF, OFF, OFF, OFF, OFF, OFF, OFF

When the max number of offsets is 14 in these modes, the preset value of Offset G ~ N is the same as the Offset F value

Rel Start

Sets a relative power level limit at the start frequency for the selected offset. The relative power level limit ranges from –200 to +50 dBc.

The fail condition is set remotely by `[:SENSe]:SEMask:OFFSet[n][:OUTer]:LIST:TEST` for each offset channel test.

You can turn off (not use) specific offset channels remotely with `[:SENSe]:SEMask:OFFSet[n][:OUTer]:LIST:STATe`.

The query returns values currently set to the relative power test limits.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query returns 14 values for WLAN Mode, or12 values for other Modes.

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:STARt:RCARrier <rel_ampl>, …` `[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:STARt:RCARrier?`
Example	`:SEM:OFFS:LIST:STAR:RCAR -30, -30, -30, -30, -30, -30` `:SEM:OFFS:LIST:STAR:RCAR?`
Notes	Comma-separated list of values OFFSet 1 is for BTS, 2 for MS. Default is BTS Note that Offset sub op code 2 is supported only in Modes other than SA. In SA mode, Offset sub op code 1 is used for both BTS and MS
Preset	When the max number of offsets is 6:

Mode	Values
SA	-30.00 dB, -30.00 dB,-30.00 dB, -30.00 dB, -30.00 dB, -30.00 dB
WCDMA	-30.00 dB, -30.00 dB, -30.00 dB, -30.00 dB, -30.00 dB, -30.00 dB|-33.73 dB, -34.00 dB, -37.50 dB, -47.50 dB, -47.50 dB, -47.50 dB

When the max number of offsets is 12 in these modes, the preset value of Offset G ~ L is the same as the Offset F value

Mode	Values
LTEAFDD, LTEATDD, 5G NR, MSR	0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB|0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB

When the max number of offsets is 14 in these modes, the preset value of Offset G ~ N is the same as the Offset F value

WLAN Mode: See table of "WLAN Mode Presets" on page 884 below

State Saved	Saved in instrument state

Rel Stop

Sets a relative power level limit at the stop frequency for the selected offset. The relative power level limit ranges from –200 to +50 dBc.

The fail condition is set remotely by `[:SENSe]:SEMask:OFFSet[n][:OUTer]:LIST:TEST` for each offset channel.

You can turn off (not use) specific offset channels remotely with `[:SENSe]:SEMask:OFFSet[n][:OUTer]:LIST:STATe`.

The query returns values currently set to the offset stop relative power limits.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query returns 14 values for WLAN Mode, or 12 values for other Modes.

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:STOP:RCARrier <rel_ampl>, …`
	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:STOP:RCARrier?`
	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:STOP:RCARrier:COUPle ON | OFF | 1 | 0, …`
	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:STOP:RCARrier:COUPle?`

Example	`:SEM:OFFS:LIST:STOP:RCAR -30, -30, -30, -30, -30, -30`
	`:SEM:OFFS:LIST:STOP:RCAR?`
	`:SEM:OFFS:LIST:STOP:RCAR:COUP ON, ON, ON, ON, ON, ON`
	`:SEM:OFFS:LIST:STOP:RCAR:COUP?`

Notes	Comma-separated list of values OFFSet 1 is for BTS, 2 for MS. Default is BTS Note that Offset sub op code 2 is supported only in Modes other than SA. In SA mode, Offset sub op code 1 is used for both BTS and MS
Couplings	Coupled to Rel Start if "Auto" is selected, that is, Start is made the same as Stop
Preset	When the max number of offsets is 6:

Mode	Values
SA	-30.00 dB, -30.00 dB, -30.00 dB, -30.00 dB, -30.00 dB, -30.00 dB
WCDMA	-30.00 dB, -30.00 dB, -30.00 dB, -30.00 dB, -30.00 dB, -30.00 dB|-48.28 dB, -37.50 dB, -47.50 dB, -47.50 dB, -47.50 dB, -47.50 dB

When the max number of offsets is 12 in these modes, the preset value of Offset G ~ L is the same as the Offset F value

Mode	Values
LTEAFDD, LTEATDD, 5G NR, MSR	0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB|0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB

When the max number of offsets is 14 in these modes, the preset value of Offset G ~ N is the same as the Offset F value

WLAN Mode: See table of "WLAN Mode Presets" on page 886 below

When the max number of offsets is 6:

Mode	Values
SA	`ON, ON, ON, ON, ON, ON`
WCDMA	`ON, ON, ON, ON, ON, ON | OFF, OFF, OFF, ON, ON, ON`

When the max number of offsets is 12 in these modes, the preset value of Offset G ~ L is the same as the Offset F value

Mode	Values
LTEAFDD, LTEATDD, 5G NR, MSR	`ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON | ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON`

When the max number of offsets is 14 in these modes, the preset value of Offset G ~ N is the same as the Offset F value

Fail Mask

Selects one of the logics for fail conditions between the measurement results and the test limits:

- `ABSolute` and `RELative` both check the results against the respective limit
- `OR` checks against both limits, failing if either of the limits is broken
- `AND` only displays a fail if both of the limits are broken

The absolute or relative power limit value for each offset channel can be set remotely with `[:SENSe]:SEMask:OFFSet[n][:OUTer]:LIST:ABSolute` or `[:SENSe]:SEMask:OFFSet[n][:OUTer]:LIST:RCARrier`.

You can turn off (not use) specific offset channels remotely with `[:SENSe]:SEMask:OFFSet[n][:OUTer]:LIST:STATe`.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query returns 14 values for WLAN Mode, or 12 values for other Modes.

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:TEST ABSolute | AND | OR | RELative, …` `[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:TEST?`
Example	`:SEM:OFFS:LIST:TEST ABS, ABS, ABS, ABS, ABS, ABS` `:SEM:OFFS:LIST:TEST?`
Notes	Comma-separated list of values Note that Offset sub op code 2 is supported only in Modes other than SA. In SA Mode, Offset sub op code 1 is used for both BTS and MS
Preset	When the max number of offsets is 6:

Mode	Values
SA	ABS, ABS, ABS, ABS, ABS, ABS
WCDMA	ABS, ABS, ABS, ABS, ABS, ABS | AND, AND, AND, AND, AND, AND
LTE, LTETDD	ABS, ABS, ABS, ABS, ABS, ABS

When the max number of offsets is 12 in these modes, the preset value of Offset G ~ L is the same as the Offset F value

Mode	Values
LTEAFDD, LTEATDD, 5G NR, MSR	ABS, ABS, ABS, ABS, ABS, ABS, ABS, ABS, ABS, ABS, ABS, ABS | ABS, ABS, ABS, ABS, ABS, ABS, ABS, ABS, ABS, ABS, ABS, ABS

When the max number of offsets is 14 in these modes, the preset value of Offset G ~ N is the same as the Offset F value

WLAN Mode: See the table of "WLAN Mode Presets" on page 889 below

State Saved	Saved in instrument state

Show Abs2 Limit

Shows or hides Abs2 limit parameters.

Remote Command	`:DISPlay:SEMask:OFFSet:SABSolute ON | OFF | 1 | 0` `:DISPlay:SEMask:OFFSet:SABSolute?`
Example	`:DISP:SEM:OFFS:SABS 1` `:DISP:SEM:OFFS:SABS?`
Preset	0
State Saved	Yes
Range	`ON|OFF`

Abs2 Start

Sets the 2nd absolute power level limit at the start frequency for the selected offset, ranging from –200 to +50 dBm.

The fail condition for each offset channel is set remotely using:

`[:SENSe]:SEMask:OFFSet[n][:OUTer]:LIST:TEST:SABSolute`

You can turn off (not use) specific offset channels remotely using:

`[:SENSe]:SEMask:OFFSet[n][:OUTer]:LIST:STATe`

The query returns values currently set to the 2nd absolute power test limits.

When sending the command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query returns 14 values for WLAN Mode, or 12 values for other Modes.

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:STARt:SABSolute <real>, …` `[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:STARt:SABSolute?`
Example	`:SEM:OFFS:LIST:STAR:SABS -12.50 dBm, -12.50 dBm, -24.50 dBm, -11.50 dBm, -11.50 dBm, -11.50 dBm` `:SEM:OFFS:LIST:STAR:SABS?`
Notes	Comma-separated list of values `OFFSet1` is for BTS, 2 for MS. Default is BTS
Preset	For WLAN Mode: 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm For other Modes: 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm | 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm
State Saved	Saved in instrument state
Min	-200 dBm
Max	50 dBm

Abs2 Stop

Sets the 2nd absolute power level limit at the stop frequency for the selected offset, ranging from –200 to +50 dBm. You can also toggle this function between **Couple** and **Manual**. If **Couple** = `ON`, the **Abs2 Stop** power level limit is coupled to "Abs2 Start" on page 889, resulting in a flat limit line. If set to **Man** (**Couple** = `OFF`), **Abs2 Start** and **Abs2 Stop** take different values, resulting in a sloped limit line.

The query returns values currently set to the offset stop absolute2 power limits.

When sending the command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query returns 14 values for WLAN Mode, or 12 values for other Modes.

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:STOP:SABSolute <real>, …`
	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:STOP:SABSolute?`
	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:STOP:SABSolute:COUPle ON | OFF | 1 | 0, …`
	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:STOP:SABSolute:COUPle?`

Example	`:SEM:OFFS:LIST:STOP:SABS -12.50 dBm, -24.50 dBm, -24.50 dBm, -11.50 dBm, -11.50 dBm, -11.50 dBm`

	`:SEM:OFFS:LIST:STOP:SABS?`
	`:SEM:OFFS:LIST:STOP:SABS:COUP ON, ON, ON, ON, ON, ON`
	`:SEM:OFFS:LIST:STOP:SABS:COUP?`

Notes	Comma separated list of values `OFFSet` 1 is for BTS, 2 for MS. Default is BTS
Couplings	Coupled to Abs2 Start if **Auto** is selected, that is, the Stop value is equal to the Start value

Preset	For WLAN Mode:
	0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm
	For other Modes:
	0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm | 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm
	For WLAN Mode:
	`ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON`
	For other Modes:
	`ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON | ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON`

State Saved	Saved in instrument state Saved in instrument state
Range	Auto|Man
Min	-200 dBm
Max	50 dBm

Fail Mask2

Selects the logic operation for fail conditions between the measurement results and the test limits:

(Primary Fail Mask selection) OR Abs2	`OR`	Checks against both Primary and Abs2 limits. The test fails if either of the limits is broken
(Primary Fail Mask selection) AND Abs2	`AND`	Checks against both Primary and Abs2 limits. The test fails if both of the limits are broken
Abs2 Disabled	`OFF`	Fail Mask2 is disabled

Note that the Primary Fail Mask selection is set by "Fail Mask" on page 887.

Examples:

- when Fail Mask is Abs **AND** Rel and Fail Mask2 is **OR** Abs2, “(Abs AND Rel) OR Abs2” is displayed in the column
- when Fail Mask is Absolute and Fail Mask2 is And Abs2, “(Absolute) AND Abs2” is displayed in the column

You can turn off (not use) specific offset channels remotely using:

`[:SENSe]:SEMask:OFFSet[n][:OUTer]:LIST:STATe`

When sending the command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query returns 14 values for WLAN Mode, or 12 values for other Modes.

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:TEST:SABSolute AND | OR | OFF, …` `[:SENSe]:SEMask:OFFSet[1]|2[:OUTer]:LIST:TEST:SABSolute?`
Example	`:SEM:OFFS:LIST:TEST:SABS AND, AND, OR, OFF, OFF, OFF` `:SEM:OFFS:LIST:TEST:SABS?`
Notes	Comma-separated list of values

Preset	For WLAN:
	`OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF`
	For other Modes:
	`OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF | OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF`

State Saved	Saved in instrument state
Range	OR Abs2|AND Abs2|Abs2 Disabled

Inner Offset (BW)

Accesses a menu that enables you to set up the bandwidth measurement parameters for inner offset pairs.

Offset Freq Define

Enables you to select offset frequency definition. Each standard defines each offset frequency from Carrier.

For example, 3GPP2 requires the “Carrier Center to Meas BW Edge” definition, and LTE conformance test requires “Carrier Edge to Meas BW Center” and/or “Carrier Edge to Meas BW Edge” definition. MSR standard requires “RF BW Edge to Meas BW Center” and/or “RF BW Edge to Meas Edge” definition.

“Meas BW Edge” means the edge frequency of resolution bandwidth closer to the carrier that is represented by Meas BW and Res BW settings. Actual center frequency of Meas BW and the limit line have ½ Meas BW offset when the Meas BW Edge is selected.

Option	SCPI	Definition
Carrier Center to	`CTOCenter`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the

Option	SCPI	Definition
Meas BW Center		center of offset measuring filter*
Carrier Center to Meas BW Edge	`CTOEdge`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the nominal -3 dB point of the offset measuring filter* closer to the carrier
Carrier Edge to Meas BW Center	`ETOCenter`	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the center frequency of offset measuring filter*
Carrier Edge to Meas BW Edge	`ETOEdge`	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the nominal -3 dB point of the offset measuring filter* closer to the carrier
Sub-block Edge to Meas BW Center	`STOCenter`	From either the lower or upper sub-block edge frequency to the center frequency of offset measuring filter*
Sub-block Edge to Meas BW Edge	`STOEdge`	From either the lower or upper sub-block edge frequency to the nominal -3 dB point of the offset measuring filter* closer to the carrier
Sub-block Center to Meas BW Center 5G NR Mode only	`SCTOCenter`	**From the center frequency of sub-block to** the center frequency of offset measuring filter*

*Measuring filter = Meas BW (N) x Res BW

** sub-block (bandwidth) = $BW_{channel,block}$ which is defined in each 3GPP standard, regardless of “Measure Carrier” for the uppermost and the lowermost carriers being Enabled or Disabled. When the **Number of Component Carriers** within each sub-block = 1, sub-block (bandwidth) = $BW_{channel}$ = 2 x $F_{offset,RAT}$.

See "Diagrams for Offset Freq Define" on page 895.

Mode: MSR, LTEAFDD, LTEATDD

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:TYPE CTOCenter | CTOEdge | ETOCenter | ETOEdge | STOCenter | STOEdge` `[:SENSe]:SEMask:OFFSet[1]|2:INNer:TYPE?`

Example	`:SEM:OFFS:INN:TYPE ETOC` `:SEM:OFFS:INN:TYPE?`
Preset	`STOCenter`
State Saved	Saved in instrument state
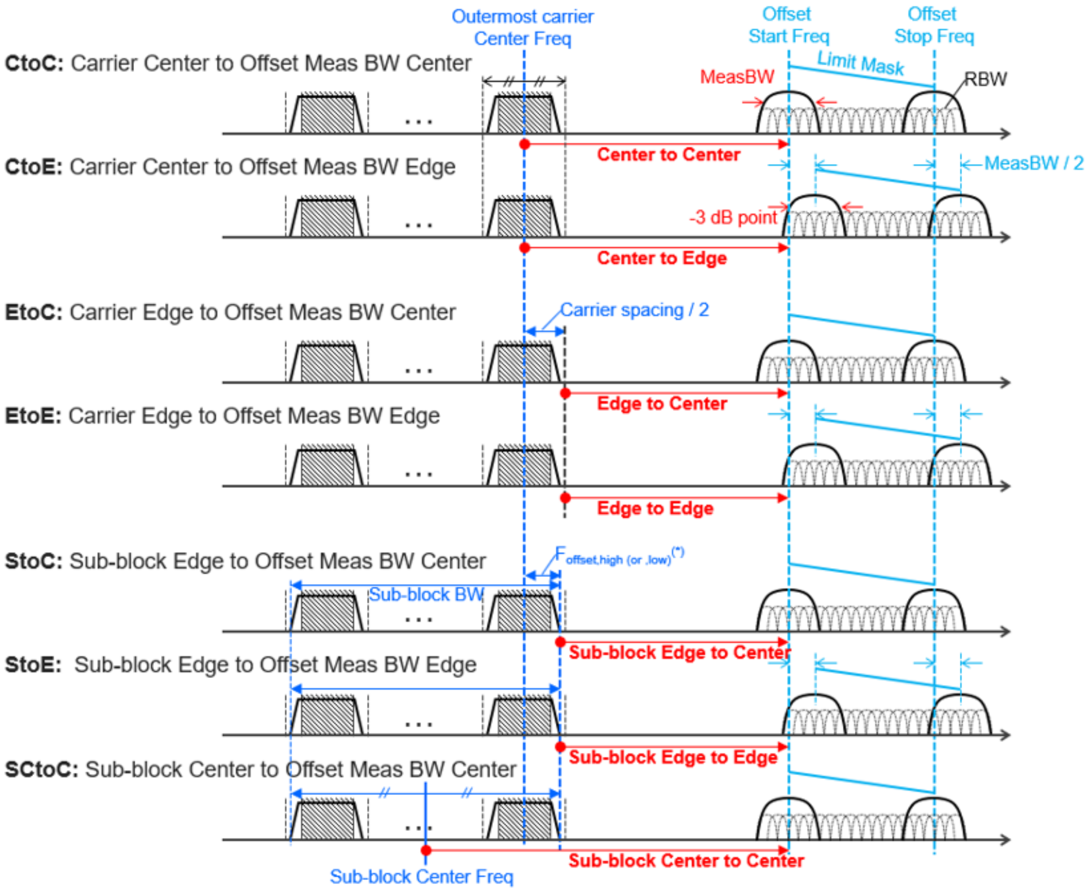
Range	Carrier Center to Meas BW Center | Carrier Center to Meas BW Edge | Carrier Edge to Meas BW Center | Carrier Edge to Meas BW Edge | Sub-block Edge to Meas BW Center | Sub-block Edge to Meas BW Edge | Sub-block Center to Meas BW Center

Diagrams for Offset Freq Define



Notes:

- *MeasBW = N x RBW*
- *Sub-block Edge and Outermost Carrier Edge in the Sub-block are not always same. e.g.) 5G NR (3GPP) defines BW_channel,block which calculates F_offset,high and F_offset,low asymmetrically with SCS shift.*
  (*) For MSR, F_offset,high (or ,low) = F_offset,RAT,high (or ,low)

Offset Detector

See "Offset Detector" on page 857.

Cumulate Mask

Selects whether inner offset limit masks are cumulated or not.

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:CMASk[:STATe] ON | OFF | 0 | 1` `[:SENSe]:SEMask:OFFSet[1]|2:INNer:CMASk[:STATe]?`
Example	`:SEM:OFFS:INN:CMAS 0` `:SEM:OFFS:INN:CMAS?`
Notes	OFFSet 1 is for BTS, 2 for MS. Default is BTS
Preset	1|0
State Saved	Yes
Range	`ON|OFF`

Cumulate Mask Stop Frequency

Specifies stop frequency of summing limit masks. For outside of the stop frequency, the limit masks are not cumulated.

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:CMASk:FREQuency:STOP <freq>` `[:SENSe]:SEMask:OFFSet[1]|2:INNer:CMASk:FREQuency:STOP?`
Example	`:SEM:OFFS:INN:CMAS:FREQ:STOP 500E6` `:SEM:OFFS:INN:CMAS:FREQ:STOP?`
Notes	OFFSet 1 is for BTS, 2 for MS. Default is BTS
Dependencies	Valid only when "Cumulate Mask " on page 895 is ON
Preset	10.5 MHz
State Saved	Yes
Min/Max	0 Hz/10 GHz

Start Freq

Specifies the start frequency for the currently selected offset. Also, enables you to toggle that offset between On and Off. When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:FREQuency:STARt <freq>, …`
	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:FREQuency:STARt?`
	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:STATe ON | OFF | 1 | 0, …`
	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:STATe?`

Example	`:SEM:OFFS2:INN:LIST:FREQ:STAR 2.515 MHz, 2.715 MHz, 3.515 MHz, 4.00 MHz, 8.00 MHz, 12.50 MHz` `:SEM:OFFS2:INN:LIST:FREQ:STAR?`

	`:SEM:OFFS:INN:LIST:STAT ON, ON, ON, OFF, OFF, OFF` `:SEM:OFFS:INN:LIST:STAT?`
Notes	Comma-separated list of values OFFSet 1 is for BTS, 2 for MS. Default is BTS If the offset is outside the frequency range, the result spectrum will be invalid
Couplings	Coupled to "Stop Freq" on page 897. If **Start Freq** exceeds **Stop Freq**, **Stop Freq** is automatically adjusted to (**Start Freq** + 100 Hz)

Preset

Mode	Values
MSR	15 kHz, 215 kHz, 1.015 MHz, 1.5 MHz, 10.5 MHz, 15.00 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz | 15 kHz, 215 kHz, 1.015 MHz, 1.5 MHz, 10.5 MHz, 15.00 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz
5G NR	50 kHz, 5.05 MHz, 10.5 MHz, 40.00 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz | 15.00 kHz, 1.5 MHz, 5.5 MHz, 100.50 MHz, 105.00 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz, 100 MHz

Res BW

Specifies which Resolution BW filter to use when measuring the currently selected offset.

Offset Res BW Mode allows the instrument to determine the optimum Resolution BW filter to use when measuring the currently selected offset. using front panel and all the offsets using SCPI. When changing the Meas BW parameter, if the Res BW needs to be changed to adhere to the rule:

(N x Res BW) <= (Stop freq of the offset - Start freq of the offset),

where N is the multiplier, this setting will automatically be changed to manual.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:BANDwidth[:RESolution] <bandwidth>, …`

<table>

Meas BW

Allows you to specify a multiplier of Res BW for the measurement integration bandwidth.

Meas BW is multiplier integer, which defines a ratio between Integration BW and **Res BW** of the measurement result:

Integration BW = Meas BW * "Res BW" on page 898

Integration BW is the desired resolution bandwidth, and **Res BW** is the actual bandwidth for sweep. Measurement sweeps with **Res BW**, and **Meas BW** compensates sweep resolution bandwidth to Integration BW.

If you set this parameter greater than 1, you can set **Res BW** narrower to avoid carrier power leakage effect to the offset power integration.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:BANDwidth:IMULti <integer>, …` `[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:BANDwidth:IMULti?`
Example	`:SEM:OFFS2:INN:LIST:BAND:IMUL 1,1,1,1,1,1` `:SEM:OFFS2:INN:LIST:BAND:IMUL?`
Notes	Comma-separated list of values OFFSet 1 is for BTS, 2 for MS. Default is BTS
Couplings	This parameter must adhere to the rule: (N x Res BW) <= (Stop freq of the offset - Start freq of the offset), where N is the multiplier If **Res BW** is changed, the multiplier changes to conform to the rule

Preset

Mode	Values
MSR	1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1 | 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1

Min/Max	0.00001/3000000

Inner Offset (Sweep)

Accesses a menu that enables you to set up the sweep measurement parameters for inner offset pairs.

Offset Freq Define

Same as "Offset Freq Define" on page 892 under **Inner Offset (BW)**

Offset Detector

Same as "Offset Detector" on page 857 under **Inner Offset (BW)**

Cumulate Mask

Same as "Cumulate Mask " on page 895 under **Inner Offset (BW)**

Cumulate Mask Stop Frequency

Same as "Cumulate Mask Stop Frequency" on page 896, under **Inner Offset (BW)**

Start Freq

Same as "Start Freq" on page 896, under **Inner Offset (BW)**

Stop Freq

Same as "Stop Freq" on page 897, under **Inner Offset (BW)**

Sweep Time

Specifies the sweep time for the currently selected offset and enables you to toggle the **Sweep Time** mode between **Auto** and **Man**.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

NOTE

On non-sweeping hardware, this column is grayed-out. The value shown on this column is an estimate of the turnaround time to complete the measurement of the entire offset span, which is the sum of signal acquisition time, FFT time, and other overhead time. If you need to specify the same **Sweep Time** as you would for sweeping hardware, send `[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:SWEep:TIME <time>`. The measurement emulates the **Sweep Time** effect, but this emulation is not straightforward, and therefore the behavior is not specified. Instead, we recommend using "Minimum Acquisition Time" on page 904, which provides better control.

<table>
<tr><td>Remote Command</td><td>[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:SWEep:TIME <time>, …

<tr><td>FFT</td><td>100ns/10 s</td></tr>
</table></td></tr>
</table>

Minimum Acquisition Time

Available on non-sweeping hardware.

Specifies the minimum acquisition time for each “chunk” of the measurement result. The instrument automatically divides **Span** into multiple chunks if needed. Therefore, the total signal acquisition time for the entire offset span is:

~(>~Minimum Acquisition Time) * (The number of chunks).

When in **Auto**, this parameter’s value is determined by other parameters, such as **Offset Start**, **Offset Stop**, **RBW** and **VBW**.

You can manually increase this parameter value from this **Auto** value.

If increased, the instrument acquires signal for the specified time duration for each chunk. It performs additional FFTs, and averages or peak-holds the FFT results for a chunk, depending on **Detector** settings.

Note that the actual acquisition time for each chunk may exceed the **Minimum Acquisition Time** value, in order to satisfy FFT time required by other parameters, and to perform an integer number of FFTs.

<table>
<tr><td>Remote Command</td><td><code>[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:SWEep:ACQuisition:TIME <time>, …</code>
<code>[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:SWEep:ACQuisition:TIME?</code>
<code>[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:SWEep:ACQuisition:TIME:AUTO ON | OFF | 1 | 0, …</code>

<tr><td>Couplings</td><td>Coupled to Offset Start Freq, Offset Stop Freq, RBW, and VBW when in the Auto state
When you manually set a value while in Auto, the state automatically changes to Man</td></tr>
</table>

Preset	Automatically calculated `ON`
State Saved	Saved in instrument state
Min	100 ns
Max	4000 s

Sweep Time Annotation (Remote Query Only)

Returns the **Sweep Time Annotation** value. Available only on non-sweeping hardware.

The value returned is the estimated turnaround time of each acquisition, in seconds. The turnaround time is the sum of the signal acquisition time, FFT time, and other overhead time, to complete the entire offset span of each measurement cycle.

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:SWEep:ETIMe?`
Example	`:SEM:OFFS2:INN:LIST:SWE:ETIM?`
Dependencies	Available only on non-sweeping hardware
Preset	Automatically calculated

Sweep Type

Specifies the **Sweep Type** for the currently selected offset and enables you to toggle **Sweep Type** mode between **Auto** and **Man**.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

How to define Sweep Time and Sweep Type

Sweep Type Mode	Behavior
Auto	**Sweep Type** is automatically selected depending on Rules **Sweep Time** is automatically calculated, according to the selected **Sweep Type**
Man	**Sweep Type** is user-selected

–

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:SWEep:TYPE SWEep | FFT, …`
	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:SWEep:TYPE?`
	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:SWEep:TYPE:AUTO ON | OFF | 1 | 0, …`
	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:SWEep:TYPE:AUTO?`

Example	`:SEM:OFFS2:INN:LIST:SWE:TYPE FFT,FFT,SWE`
	`:SEM:OFFS2:INN:LIST:SWE:TYPE?`
	`:SEM:OFFS2:INN:LIST:SWE:TYPE:AUTO ON, ON, ON, ON, OFF, OFF`
	`:SEM:OFFS2:INN:LIST:SWE:TYPE:AUTO?`

Notes	Comma-separated list of values OFFSet 1 is for BTS, 2 for MS. Default is BTS
Dependencies	Not available in modular products, such as VXT
Couplings	When **Sweep Type** is set manually, **Sweep Type** Mode is set to `MANual` When **Sweep Type** Mode is **Auto**, **Sweep Type** is automatically selected according to "Sweep Type Rules" on page 850
Preset	Automatically calculated `ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON`
State Saved	Saved in instrument state
Range	Auto|Man

Offset Side

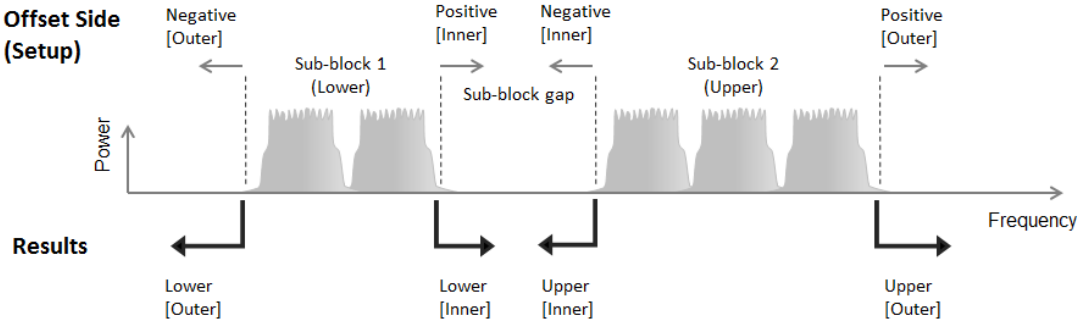
Specifies which offset side to measure.

You can turn off (not use) specific offsets with `[:SENSe]:SEMask:OFFSet[n]:INNer:LIST:STATe`.

`BOTH`	Both sides in the sub-block gap are enabled.
`NEGative`	The upper side in the sub-block gap only (i.e., negative sideband of the upper sub-block) is enabled
`POSitive`	The lower side in the sub-block gap only (i.e., positive sideband of the lower sub-block) is enabled.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

The figure below shows the relation between the negative/positive offset side setups and the upper/lower results in the MSR and LTE-Advanced FDD/TDD Modes.



<table>
<tr><td>Remote Command</td><td>[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:SIDE BOTH | NEGative | POSitive, …

Inner Offset (Limits)

Accesses a menu that enables you to set the power limits for start and stop frequencies of the selected inner offsets.

Start Freq

Same as "Start Freq" on page 896 under **Inner Offset (BW)**

Stop Freq

Same as "Stop Freq" on page 897 under **Inner Offset (BW)**

Abs Start

Sets the absolute power level limit at the start frequency for the selected inner offset, ranging from –200 to +50 dBm.

The fail condition for each inner offset channel is set remotely by `[:SENSe]:SEMask:OFFSet[n]:INNer:LIST:TEST`.

You can turn off (not use) specific inner offset channels remotely with `[:SENSe]:SEMask:OFFSet[n]:INNer:LIST:STATe`.

The query returns values currently set to the absolute power test limits.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:STARt:ABSolute <real>, …` `[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:STARt:ABSolute?`
Example	`:SEM:OFFS2:INN:LIST:STAR:ABS -12.50 dBm, -12.50 dBm, -24.50 dBm, -11.50 dBm, -11.50 dBm, -11.50 dBm` `:SEM:OFFS2:INN:LIST:STAR:ABS?`
Notes	Comma-separated list of values OFFSet 1 is for BTS, 2 for MS. Default is BTS
Preset	see table below
State Saved	Saved in instrument state
Min/Max	-200 dBm/50 dBm

Preset:

Mode	Values
MSR	-12.5 dBm, -12.5 dBm, -24.5 dBm, -11.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm| -12.5 dBm, -12.5 dBm, -24.5 dBm, -11.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm
5G NR	-5.5 dBm, -12.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm|-22.5 dBm, -8.5 dBm, -11.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm
LTEAFDD, LTEATDD	-5.5 dBm, -12.5 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm, -15.0 dBm|-13.5 dBm, -8.5 dBm, -11.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm, -23.5 dBm

Abs Stop

Sets the absolute power level limit at the stop frequency for the selected inner offset, ranging from –200 to +50 dBm. You can also toggle this function between **Couple** (`COUPle = ON`) and **Manual** (`COUPle = OFF`). If set to **Couple**, the Abs Stop power level limit is coupled to Abs Start to result in a flat limit line. If set to **Man**, Abs Start and Abs Stop take different values to result in a sloped limit line.

The query returns values currently set to the inner offset stop absolute power limits.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

Range	Auto|Man
Min/Max	-200 dBm/50 dBm

Rel Start

Sets a relative power level limit at the start frequency for the selected inner offset, ranging from –200 to +50 dBc.

The fail condition is set remotely by `[:SENSe]:SEMask:OFFSet[n]:INNer:LIST:TEST` for each inner offset channel test.

You can turn off (not use) specific inner offset channels remotely with `[:SENSe]:SEMask:OFFSet[n]:INNer:LIST:STATe`.

The query returns values currently set to the relative power test limits.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:STARt:RCARrier <rel_ampl>, …` `[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:STARt:RCARrier?`
Example	`:SEM:OFFS:INN:LIST:STAR:RCAR -30, -30, -30, -30, -30, -30` `:SEM:OFFS:INN:LIST:STAR:RCAR?`
Notes	Comma-separated list of values OFFSet 1 is for BTS, 2 for MS. Default is BTS
Preset	0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB | 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB
State Saved	Saved in instrument state
Min/Max	-200 dB/50 dB

Rel Stop

Sets a relative power level limit at the stop frequency for the selected inner offset, ranging from –200 to +50 dBc.

The fail condition is set remotely by `[:SENSe]:SEMask:OFFSet[n]:INNer:LIST:TEST` for each inner offset channel.

You can turn off (not use) specific inner offset channels remotely with `[:SENSe]:SEMask:OFFSet[n]:INNer:LIST:STATe`.

The query returns values currently set to the inner offset stop relative power limits.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:STOP:RCARrier <rel_ampl>, …`
	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:STOP:RCARrier?`
	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:STOP:RCARrier:COUPle ON | OFF | 1 | 0, …`
	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:STOP:RCARrier:COUPle?`

Example	`:SEM:OFFS:INN:LIST:STOP:RCAR -30, -30, -30, -30, -30, -30`
	`:SEM:OFFS:INN:LIST:STOP:RCAR?`
	`:SEM:OFFS:INN:LIST:STOP:RCAR:COUP ON, ON, ON, ON, ON, ON`
	`:SEM:OFFS:INN:LIST:STOP:RCAR:COUP?`

Notes	Comma-separated list of values OFFSet 1 is for BTS, 2 for MS. Default is BTS
Couplings	Coupled to Rel Start if “Auto” is selected, that is, Start is made the same as Stop
Preset	0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB | 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB, 0 dB `ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON | ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON`
State Saved	Saved in instrument state Saved in instrument state
Range	Auto|Man
Min/Max	-200 dB/50 dB

Fail Mask

Selects one of the logics for fail conditions between the measurement results and the test limits:

- `ABSolute` and `RELative` both check the results against the respective limit
- `OR` checks against both limits, failing if either of the limits is broken
- `AND` only displays a fail if both of the limits are broken

The absolute or relative power limit value for each inner offset channel can be set remotely with `[:SENSe]:SEMask:OFFSet[n]:INNer:LIST:ABSolute` or `[:SENSe]:SEMask:OFFSet[n]:INNer:LIST:RCARrier`.

You can turn off (not use) specific inner offset channels remotely with `[:SENSe]:SEMask:OFFSet[n]:INNer:LIST:STATe`.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query for this parameter always returns 12 values.

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:TEST ABSolute | AND | OR | RELative, …` `[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:TEST?`
Example	`:SEM:OFFS:INN:LIST:TEST ABS, ABS, ABS, ABS, ABS, ABS` `:SEM:OFFS:INN:LIST:TEST?`
Notes	Comma-separated list of values
Preset	`ABS, ABS, ABS, ABS, ABS, ABS, ABS, ABS, ABS, ABS, ABS, ABS`
State Saved	Saved in instrument state
Range	Absolute | Relative | Abs AND Rel | Abs OR Rel

Show Abs2 Limit

Same as "Show Abs2 Limit" on page 912 under Limits.

Abs2 Start

Sets the 2nd absolute power level limit at the start frequency for the selected inner offset, ranging from –200 to +50 dBm.

The fail condition for each inner offset channel is set remotely using:

`[:SENSe]:SEMask:OFFSet[n]:INNer:LIST:TEST:SABSolute`

You can turn off (not use) specific inner offset channels remotely using:

`[:SENSe]:SEMask:OFFSet[n]:INNer:LIST:STATe`

The query returns values currently set to the 2nd absolute power test limits.

When sending the command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query always returns 12 values.

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:STARt:SABSolute <real>, …` `[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:STARt:SABSolute?`
Example	`:SEM:OFFS:INN:LIST:STAR:SABS -12.50 dBm, -12.50 dBm, -24.50 dBm, -11.50 dBm, -11.50 dBm, -11.50 dBm` `:SEM:OFFS:INN:LIST:STAR:SABS?`
Notes	Comma-separated list of values `OFFSet` 1 is for BTS, 2 for MS. Default is BTS
Preset	0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm|0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm
State Saved	Saved in instrument state
Min	-200 dBm
Max	50 dBm

Abs2 Stop

Sets the 2nd absolute power level limit at the stop frequency for the selected inner offset, ranging from –200 to +50 dBm. You can also toggle this function between **Couple** and **Manual**. If set to **Couple** = `ON`, the **Abs2 Stop** power level limit is coupled to "Abs2 Start" on page 912, resulting in a flat limit line. If set to **Man** (**Couple** = `OFF`), **Abs2 Start** and **Abs2 Stop** take different values, resulting in a sloped limit line.

The query returns values currently set to the offset stop 2nd absolute power limits.

When sending the command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query always returns 12 values.

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:STOP:SABSolute <real>, …`
	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:STOP:SABSolute?`
	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:STOP:SABSolute:COUPle ON | OFF | 1 | 0, …`
	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:STOP:SABSolute:COUPle?`

Example	`:SEM:OFFS:INN:LIST:STOP:SABS -12.50 dBm, -24.50 dBm, -24.50 dBm, -11.50 dBm, -11.50 dBm, -11.50 dBm`
	`:SEM:OFFS:INN:LIST:STOP:SABS?`
	`:SEM:OFFS:INN:LIST:STOP:SABS:COUP ON, ON, ON, ON, ON, ON`
	`:SEM:OFFS:INN:LIST:STOP:SABS:COUP?`

Notes	Comma-separated list of values `OFFSet` 1 is for BTS, 2 for MS. Default is BTS

Couplings	Coupled to Abs Start if **Auto** is selected, that is, the Stop value is equal to the Start value
Preset	0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm|0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm `ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON | ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON`
State Saved	Saved in instrument state Saved in instrument state
Range	Auto|Man
Min	-200 dBm
Max	50 dBm

Fail Mask2

Selects one of the logical operations for fail conditions between the measurement results and the test limits:

(Primary Fail Mask selection) OR Abs2	`OR`	Checks against both Primary and Abs2 limits. The test fails if either of the limits is broken
(Primary Fail Mask selection) AND Abs2	`AND`	Checks against both Primary and Abs2 limits. The test fails if both of the limits are broken
Abs2 Disabled	`OFF`	Fail Mask2 is disabled

For examples, see "Fail Mask2" on page 891.

Note that the Primary Fail Mask selection is set by "Fail Mask" on page 911.

You can turn off (not use) specific inner offset channels remotely using:

`[:SENSe]:SEMask:OFFSet[n]:INNer:LIST:STATe`

When sending the command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged. The query always returns 12 values.

Remote Command	`[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:TEST:SABSolute AND | OR | OFF, …` `[:SENSe]:SEMask:OFFSet[1]|2:INNer:LIST:TEST:SABSolute?`
Example	`:SEM:OFFS:INN:LIST:TEST:SABS AND, AND, OR, OFF, OFF, OFF` `:SEM:OFFS:INN:LIST:TEST:SABS?`
Notes	Comma-separated list of values
Preset	`OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF | OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF`
State Saved	Saved in instrument state
Range	OR Abs2 | AND Abs2 | Abs2 Disabled

Meas Setup Summary Table

Lets you view and access many of the parameters in the **Meas Setup** menus on one screen.

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "Measurement-Specific Details" on page 916 below.

Remote Command	`:COUPle ALL`
Example	`:COUP ALL`
Backwards Compatibility SCPI	`:COUPLE ALL | NONE`
Backwards Compatibility Notes	`:COUP:NONE` puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is *not* recommended for making measurements or new designs

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple***does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all the measurement parameters to their default values.

Remote Command	`:CONFigure:SEMask`
Example	`:CONF:SEM`
Couplings	Restores all measurement parameters to their default values

3.5.23.2 Carrier

Used to set up parameters that define how the reference channel is measured.

Integ BW

Specifies the integration bandwidth used to calculate the power in the reference channel.

Remote Command	`[:SENSe]:SEMask:BANDwidth[1]|2:INTegration <bandwidth>` `[:SENSe]:SEMask:BANDwidth[1]|2:INTegration?`
Example	`:SEM:BAND:INT 10 MHz` `:SEM:BAND:INT?`
Notes	10% . 100% of Channel Span Parameter Value Bandwidth sub op code, 1 is for BTS, 2 for MS. Default is BTS Note that Bandwidth sub op code 2 is supported only in non-SA Modes. In SA Mode, Bandwidth sub op code 1 is used for both BTS and MS If the ref channel is outside the frequency range, the result spectrum will be invalid
Dependencies	Not shown in MSR, LTE-Advanced FDD/TDD and 5G NR Modes In order to maintain backwards compatible with legacy LTE FDD/TDD Modes, the remote command is supported in LTE & LTE-A converged application
Couplings	Cannot be higher than the channel **Span**. If lower than 1/10 of channel **Span**, then the channel **Span** is reduced to be 10 times the Integ BW
Preset	<table><tr><th>Mode</th><th>Value</th></tr><tr><td>SA</td><td>3.84 MHz</td></tr><tr><td>WCDMA</td><td>3.84 MHz|3.84 MHz</td></tr><tr><td>WLAN</td><td>See the table of "WLAN Mode Presets" on page 918 below</td></tr></table>
State Saved	Saved in instrument state
Min/Max	1 kHz/Depends on instrument maximum frequency

Backwards Compatibility SCPI	`[:SENSe]:SEMask:BWIDth[1]|2:INTegration`

WLAN Mode Presets

Radio Std	Presets
802.11a/g (OFDM/DSSS-OFDM) 802.11n/ac (20 MHz)	18 MHz
802.11b/g (DSSS/CCK/PBCC)	22 MHz
802.11n (40MHz)/ 802.11ac (40 MHz)	38 MHz
802.11ac (80 MHz)	78 MHz
802.11ac (160 MHz)	158 MHz
802.11ac (80 MHz + 80 MHz)	78 MHz
802.11ah (1 MHz)	0.9 MHz
802.11ah (2 MHz)	1.8 MHz
802.11ah (4 MHz)	3.8 MHz
802.11ah (8 MHz)	7.8 MHz
802.11ah (16 MHz)	15.8 MHz
802.11j/p (20 MHz)	18 MHz
802.11j/p (10 MHz)	9 MHz
802.11p (5 MHz)	4.5 MHz
802.11ax/be (20 MHz)	19.5 MHz
802.11ax/be (40 MHz)	39.0 MHz
802.11ax/be (80 MHz)	79.0 MHz
802.11ax/be (160 MHz)	159.0 MHz
802.11be (320 MHz)	319.0 MHz
802.11ax (80 MHz + 80 MHz)	79.0 MHz
802.11af (6 MHz)	5.7 MHz
802.11af (7 MHz)	6.65 MHz
802.11af (8 MHz)	7.6 MHz

Span

Specifies the span used to calculate the power in the reference channel.

Remote Command

```
[:SENSe]:SEMask:FREQuency[1]|2:SPAN <freq>
[:SENSe]:SEMask:FREQuency[1]|2:SPAN?
[:SENSe]:SEMask:FREQuency[1]|2:SPAN:AUTO ON | OFF | 1 | 0
```

	`[:SENSe]:SEMask:FREQuency[1]|2:SPAN:AUTO?`

Example	`:SEM:FREQ:SPAN 3MHz`
	`:SEM:FREQ:SPAN?`
	`:SEM:FREQ:SPAN:AUTO OFF`
	`:SEM:FREQ:SPAN:AUTO?`

Notes	Frequency sub op code, 1 is for BTS, 2 for MS. Default is BTS Note that Frequency sub op code 2 is supported only in non-SA Modes. In SA Mode, Frequency sub op code 1 is used for both BTS and MS If the ref channel is outside the frequency range, the result spectrum will be invalid
Dependencies	Not shown in MSR Mode In order to maintain backwards compatible with legacy LTE FDD/TDD Modes, the channel span key is supported in LTE & LTE-A converged application. The **Auto/Man** toggle is added to this key. This key is enabled and can be changed only in single carrier. The span state is always **Auto** in Multi-carriers Span **Auto/Man** state is only available in LTE/LTE-Advanced FDD/TDD and 5G NR Modes
Couplings	Range 1 kHz to 50 MHz (although restricted by Chan Integ BW). If you set the channel **Span** lower than channel **Integ BW**, they will both track each other. As you increase the channel **Span**, **Integ BW** also increases if it is less than 1/10 of the channel **Span** For WLAN 802.11ac (80 + 80 MHz), the channel span is coupled with the difference between the center frequencies of the two carriers. When the difference is either less than 80 MHz, or greater than 565 MHz, a “setting conflict” error message is displayed Chan Span = Carrier Spacing + Chan IntegBW When the state of Span is **Auto**, the span value is automatically determined by multi-carrier configuration. Otherwise, the span value depends on user input When the span value is set manually, the state of span is automatically changes to **Man** This key is enabled and can be changed only in single carrier. The span state is always **Auto** in Multi-carriers
Preset	see table below `ON`
State Saved	Saved in instrument state Yes
Range	Auto|Man
Min/Max	1 kHz/Depends on instrument maximum frequency

Preset:

Mode	Value
`SA`	5.0 MHz
`WCDMA`	5.0 MHz|5.0 MHz
`LTEAFDD, LTEATDD`	5 MHz
`5GNR`	Automatically calculated
`WLAN`	See the table of "WLAN Mode Presets" on page 920 below

WLAN Mode Presets

Radio Std	Presets
802.11a/g (OFDM/DSSS-OFDM) 802.11n/ac (20 MHz)	18 MHz
802.11b/g (DSSS/CCK/PBCC)	22 MHz
802.11n/ac (40 MHz)	38 MHz
802.11ac (80 MHz)	78 MHz
802.11ac (160 MHz)	158 MHz
802.11ac (80 MHz + 80 MHz)	320 MHz
802.11ah (1 MHz)	0.9 MHz
802.11ah (2 MHz)	1.8 MHz
802.11ah (4 MHz)	3.8 MHz
802.11ah (8 MHz)	7.8 MHz
802.11ah (16 MHz)	15.8 MHz
802.11j/p (20 MHz)	18 MHz
802.11j/p (10 MHz)	9 MHz
802.11p (5 MHz)	4.5 MHz
802.11ax/be (20 MHz)	19.5 MHz
802.11ax/be (40 MHz)	39.0 MHz
802.11ax/be (80 MHz)	79.0 MHz
802.11ax/be (160 MHz)	159.0 MHz
802.11be (320 MHz)	319.0 MHz
802.11ax (80 MHz + 80 MHz)	320.0 MHz
802.11af (6 MHz)	5.7 MHz
802.11af (7 MHz)	6.65 MHz
802.11af (8 MHz)	7.6 MHz

Sweep Time

Used to calculate the power in the reference channel. **Sweep Time** can be set manually or put into **Auto** mode.

For instruments with non-sweeping acquisitions, such as VXT, the time value is the acquisition time for an individual FFT segment, not the cumulated time for all FFT segments in the channel.

NOTE On non-sweeping hardware, this control is grayed-out. The value shown on this control is an estimate, which is the turnaround time to complete the measurement of the entire carrier span, which is the sum of signal acquisition time, FFT time, and other overhead time. If you need to specify the same **Sweep Time** as you would for sweeping hardware, send `[:SENSe]:SEMask:SWEep[1]|2:TIME <time>`. The measurement emulates the **Sweep Time** effect, but this emulation is not straightforward, and therefore the behavior is not specified. Instead, we recommend using "Minimum Acquisition Time" on page 922, which provides better control.

Remote Command	`[:SENSe]:SEMask:SWEep[1]|2:TIME <time>`
	`[:SENSe]:SEMask:SWEep[1]|2:TIME?`
	`[:SENSe]:SEMask:SWEep[1]|2:TIME:AUTO OFF | 0 | ON | 1`
	`[:SENSe]:SEMask:SWEep[1]|2:TIME:AUTO?`

Example	`:SEM:SWE:TIME 9ms`
	`:SEM:SWE:TIME?`
	`:SEM:SWE:TIME:AUTO OFF`
	`:SEM:SWE:TIME:AUTO?`

Notes	Sub op code 1 is for BTS, 2 for MS. Default is BTS Note that Sweep sub op code 2 is supported only in non-SA Modes. In SA Mode, Sweep sub op code 1 is used for both BTS and MS
Dependencies	On non-sweeping hardware, this control is grayed out and the **Auto/Man** checkbox is invisible. The read-only value shows the estimated sweep time In those instruments, "Minimum Acquisition Time" on page 922 is available
Couplings	When the time is set manually, **Auto** is set to `OFF` If state is **Auto**, coupled with **Channel Detector** selection, **Channel Resolution BW**, **Channel Video BW** When set to **Auto**, the Time is automatically calculated
Preset	Automatically calculated `ON`
State Saved	Saved in instrument state Yes
Range	`OFF|ON`
Min	Sweeping hardware Depends on Channel "Sweep Type" on page 923:

Sweep Type	Min
Swept	1 ms
FFT	100 ns

Non-sweeping hardware: N/A

Max	Sweeping hardware: 4000 s Non-sweeping hardware: N/A
Backwards Compatibility SCPI	`[:SENSe]:SEMask:SWEep[1]|2[:TIME]` `[:SENSe]:SEMask:SWEep[1]|2[:TIME]:AUTO`

Minimum Acquisition Time

Available on non-sweeping hardware.

Specifies the minimum acquisition time for each “chunk” of the measurement result. The instrument automatically divides **Span** into multiple chunks if needed. Therefore, the total signal acquisition time for the entire carrier span is:

~(>~Minimum Acquisition Time) * (The number of chunks)

When in **Auto**, this parameter’s value is determined by other parameters, such as **Span**, **RBW** and **VBW**.

You can manually increase this parameter value from this **Auto** value.

If increased, the instrument acquires signal for the specified time duration for each chunk. It performs additional FFTs, and averages or peak-holds the FFT results for a chunk, depending on **Detector** settings.

Note that the actual acquisition time for each chunk may exceed the **Minimum Acquisition Time** value, in order to satisfy FFT time required by other parameters, and to perform an integer number of FFTs.

Remote Command	`[:SENSe]:SEMask:SWEep:ACQuisition:TIME <time>`
	`[:SENSe]:SEMask:SWEep:ACQuisition:TIME?`
	`[:SENSe]:SEMask:SWEep:ACQuisition:TIME:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:SEMask:SWEep:ACQuisition:TIME:AUTO?`

Example	`:SEM:SWE:ACQ:TIME 500 ms`
	`:SEM:SWE:ACQ:TIME?`
	`:SEM:SWE:ACQ:TIME:AUTO OFF`
	`:SEM:SWE:ACQ:TIME:AUTO?`

Dependencies	Available only on non-sweeping hardware
Couplings	Coupled to **Span**, **RBW**, and **VBW** when in the **Auto** state If you manually set a value when in the **Auto** state, the state automatically changes to **Man**
Preset	Automatically calculated `ON`
State Saved	Saved in instrument state
Min	100 ns
Max	4.00 ks

Sweep Time Annotation (Remote Query Only)

Returns the **Sweep Time Annotation** value. Available only on non-sweeping hardware.

The value returned is the estimated turnaround time of each acquisition, in seconds. The turnaround time is the sum of the signal acquisition time, FFT time, and other overhead time, to complete the entire carrier span of each measurement cycle.

Remote Command	`[:SENSe]:SEMask:SWEep:ETIMe?`
Example	`:SEM:SWE:ETIM?`
Dependencies	Available only on non-sweeping hardware
Preset	Automatically calculated

Sweep Type

Sets the **Sweep Type** used to calculate the power in the reference channel. **Sweep Type** can be set manually or put into **Auto** mode.

How to define Channel Sweep Time and Channel Sweep Type:

Channel Sweep Type Mode	Behavior
Auto	Channel **Sweep Type** is automatically selected depending on Sweep Type Rules Channel **Sweep Time** is automatically calculated depending on the selected sweep type
Man	Channel **Sweep Type** is user-selected

–

Remote Command	`[:SENSe]:SEMask:SWEep[1]|2:TYPE SWEep | FFT`
	`[:SENSe]:SEMask:SWEep[1]|2:TYPE?`
	`[:SENSe]:SEMask:SWEep[1]|2:TYPE:AUTO OFF | 0 | ON | 1`
	`[:SENSe]:SEMask:SWEep[1]|2:TYPE:AUTO?`

Example	`:SEM:SWE:TYPE FFT`
	`:SEM:SWE:TYPE?`
	`:SEM:SWE:TYPE:AUTO OFF`
	`:SEM:SWE:TYPE:AUTO?`

Notes	Sub op code, 1 is for BTS, 2 for MS. Default is BTS Note that Sweep sub op code 2 is supported only in non-SA Modes. In SA Mode, Sweep sub op code 1 is used for both BTS and MS

Dependencies	Grayed-out in VXT models M9410A/11A
Couplings	If **Sweep Type** is set manually, **Sweep Type** mode is set to `MANual` When **Channel Sweep Type** mode is **Auto**, **Sweep Type** is automatically selected according to **Sweep Type Rules**
Preset	Automatically calculated `ON`
State Saved	Saved in instrument state Yes
Range	`OFF`|`ON`

Res BW

Sets the resolution bandwidth used to calculate the power in the reference channel. The Channel Resolution BW can be set manually or put into auto mode.

MSR Auto RBW:

In the MSR Mode, resolution bandwidth is predefined for each radio format. When carriers are configured with multiple radio formats, the narrowest RBW is selected.

Radio Format		RBW (kHz)
LTE	1.4 MHz	13 kHz
	3 MHz	27 kHz
	5 MHz	47 kHz
	10 MHz	91 kHz
	15 MHz	150 kHz
	20 MHz	180 kHz
	200 kHz (NB-IoT, only available in FDD)	10 kHz
W-CDMA		75 kHz

5G NR Auto RBW:

Radio Format		**RBW**
5G NR	5 MHz	47 kHz
	10 MHz	91 kHz
	15 MHz	150 kHz
	20 MHz	180 kHz
	25 MHz	240 kHz
	30 MHz	270 kHz
	35 MHz	330 kHz
	40 MHz	390 kHz
	45 MHz	430 kHz
	50 MHz	470 kHz
	60 MHz	560 kHz
	70 MHz	680 kHz
	80 MHz	750 kHz
	90 MHz	820 kHz
	100 MHz	910 kHz
	200MHz	1.8 MHz
	400 MHz	3 MHz
	800 MHz	3 MHz
	1600 MHz	3 MHz
	2000 MHz	3 MHz

In the LTE-Advanced (both FDD and TDD) and 5G NR modes, the resolution bandwidth is predefined based on the corresponding bandwidth of the single carrier, which is listed above. When **Res BW** mode is **Auto**, the narrowest RBW is selected.

Remote Command	`[:SENSe]:SEMask:BANDwidth[1]|2[:RESolution] <bandwidth>`
	`[:SENSe]:SEMask:BANDwidth[1]|2[:RESolution]?`
	`[:SENSe]:SEMask:BANDwidth[1]|2[:RESolution]:AUTO OFF | ON | 1 | 0`
	`[:SENSe]:SEMask:BANDwidth[1]|2[:RESolution]:AUTO?`

Example	`:SEM:BAND 100 kHz`
	`:SEM:BAND?`
	`:SEM:BAND:AUTO ON`
	`:SEM:BAND:AUTO?`

Notes	Bandwidth sub op code, 1 is for BTS, 2 for MS. Default is BTS Note that Bandwidth sub op code 2 is supported only in non-SA modes. In SA Mode, Bandwidth sub op code 1 is used for both BTS and MS
Couplings	If **Res BW** is set manually, **Channel Resolution BW** mode is set to `MANual`

<table>
<tr><td></td><td>Coupled with Channel Detector selection, Channel Sweep Time and Channel Video BW

</table>

Video BW

Sets the video bandwidth used to calculate the power in the reference channel. The **Channel Video BW** can be set manually or put into **Auto** mode.

Remote Command	`[:SENSe]:SEMask:BANDwidth[1]|2:VIDeo <bandwidth>`
	`[:SENSe]:SEMask:BANDwidth[1]|2:VIDeo?`
	`[:SENSe]:SEMask:BANDwidth[1]|2:VIDeo:AUTO OFF | ON | 1 | 0`
	`[:SENSe]:SEMask:BANDwidth[1]|2:VIDeo:AUTO?`

Example	`:SEM:BAND:VID 100 kHz`
	`:SEM:BAND:VID?`
	`:SEM:BAND:VID:AUTO ON`
	`:SEM:BAND:VID:AUTO?`

Notes	Bandwidth sub op code, 1 is for BTS, 2 for MS. Default is BTS Note that Bandwidth sub op code 2 is supported only in non-SA Modes. In SA Mode, Bandwidth sub op code 1 is used for both BTS and MS
Couplings	If **Video BW** is set manually, **Channel Video BW** mode is set to `MANual` Coupled with **Channel Detector** selection, **Channel Sweep Time** and **Channel Resolution BW** When set to **Auto**, the video bandwidth is automatically calculated

Preset	**Mode** / **Values** SA: 100 kHz WCDMA: 75 kHz LTE, LTEAFDD, LTETDD, LTEATDD, 5G NR, WLAN, MSR: Auto `ON`
State Saved	Saved in instrument state Yes
Range	Auto | Man
Min/Max	1 Hz/50 MHz
Backwards Compatibility SCPI	`[:SENSe]:SEMask:BWIDth[1]|2:VIDeo` `[:SENSe]:SEMask:BWIDth[1]|2:VIDeo:AUTO`

VBW/RBW

Sets the Video BW/Resolution BW ratio to calculate the Channel Resolution BW and Channel Video BW. The VBW/RBW Ratio can be set manually or put into **Auto** mode.

Remote Command	`[:SENSe]:SEMask:BANDwidth[1]|2:VIDeo:RATio <real>`
	`[:SENSe]:SEMask:BANDwidth[1]|2:VIDeo:RATio`
	`[:SENSe]:SEMask:BANDwidth[1]|2:VIDeo:RATio:AUTO OFF | ON | 1 | 0`
	`[:SENSe]:SEMask:BANDwidth[1]|2:VIDeo:RATio:AUTO?`

Example	`:SEM:BAND:VID:RAT 0.1`
	`:SEM:BAND:VID:RAT?`
	`:SEM:BAND:VID:RAT:AUTO ON`
	`:SEM:BAND:VID:RAT:AUTO?`

Notes	Bandwidth sub op code, 1 is for BTS, 2 for MS. Default is BTS Note that Bandwidth sub op code 2 is supported only in non-SA Modes. In SA Mode, Bandwidth sub op code 1 is used for both BTS and MS
Couplings	When **Video BW/Res BW** is set manually, **Channel VBW/RBW Ratio** mode is set to `MANual` When set to **Auto**, the **VBW/RBW Ratio** is automatically calculated
Preset	SA, WCDMA: 1.0 LTE, LTETDD, LTEAFDD, LTEATDD, 5G NR, WLAN, MSR: Auto `ON`
State Saved	Saved in instrument state Saved in instrument state
Range	Auto | Man

Min/Max	0.00001/3000000
Backwards Compatibility SCPI	`[:SENSe]:SEMask:BWIDth[1]|2:VIDeo:RATio` `[:SENSe]:SEMask:BWIDth[1]|2:VIDeo:RATio:AUTO`

Channel Detector

Accesses a menu of functions that enable you to control the detectors for reference channel. The following choices are available:

`AUTO`	The detector selected depends on marker functions, trace functions, average type, and the trace averaging function
`NORMal`	The detector determines the peak of the CW-like signals, and it yields alternating maximums and minimums of noise-like signals. This is also referred to as Rosenfell detection
`AVERage`	The detector determines the average of the signal within the sweep points. The averaging method depends upon the Average Type selection (voltage, power or log scales)
`POSitive` Peak	The detector determines the maximum of the signal within the sweep points
`SAMPle`	The detector indicates the instantaneous level of the signal at the center of the sweep points represented by each display point
`NEGative` Peak	The detector determines the minimum of the signal within the sweep points

Remote Command	`[:SENSe]:SEMask:DETector:CARRier[:FUNCtion] AVERage | NEGative | NORMal | POSitive | SAMPle`
	`[:SENSe]:SEMask:DETector:CARRier[:FUNCtion]?`
	`[:SENSe]:SEMask:DETector:CARRier:AUTO ON | OFF | 1 | 0`
	`[:SENSe]:SEMask:DETector:CARRier:AUTO?`

Example	`:SEM:DET:CARR NEG`
	`:SEM:DET:CARR?`
	`:SEM:DET:CARR:AUTO OFF`
	`:SEM:DET:CARR:AUTO?`

Notes	When you manually select a detector (instead of selecting **Auto**), that detector is used regardless of other instrument settings Note: This detector setting affects the reference channel. There is no per-trace detector
Couplings	See Couplings in "Trace Type" on page 2137
Preset	`AVERage` `ON`
State Saved	Saved in instrument state
Range	`AVERage|NEGative|NORMal|POSitive|SAMPle`

Reference Carrier Average Type (Remote Command Only)

Select trace average type for the reference carrier.

Remote Command	`[:SENSe]:SEMask:AVERage:CARRier:TYPE RMS | LOG` `[:SENSe]:SEMask:AVERage:CARRier:TYPE?`
Example	`:SEM:AVER:CARR:TYPE LOG` `:SEM:AVER:CARR:TYPE?`
Preset	`RMS`
State Saved	Saved in instrument state

Offset/Limits Config Table

This function is the same as "Offset/Limits Config Table" on page 852 under the "Settings" on page 848 tab.

Sets the power reference in the carrier that will be used to compute the relative values for the offsets.

3.5.23.3 Reference

Lets you set the Reference Power and parameters related to the Reference Power for SEM measurements.

Measurement Type

Accesses a menu that enables you to select one of the following measurement reference types:

Total Pwr Ref	`TPRef`	Sets the reference to the total carrier power and the measured data is shown in dBc and dBm
PSD Ref	`PSDRef`	Sets the reference to the mean power spectral density of the carrier and the measured data is shown in dB and dBm/Hz
Spectrum Peak Ref	`SPRef`	Sets the reference to the spectrum peak power of the carrier and the measured data is shown in dB and dBm

Remote Command	`[:SENSe]:SEMask:TYPE PSDRef | TPRef | SPRef` `[:SENSe]:SEMask:TYPE?`
Example	`:SEM:TYPE PSDR` `:SEM:TYPE?`
Preset	WLAN Mode: `SPRef`

	All other Modes: `TPRef`
State Saved	Saved in instrument state
Range	Total Pwr Reference | PSD Reference | Spectrum Peak Reference

Power Ref

Selects the power reference type:

Option	SCPI	Description
Left & Right Carriers	`LRCarriers`	Powers of leftmost and rightmost carriers with Measure Carrier On in a sub-block are the references of left and right sides respectively. Only the frequency ranges of leftmost and rightmost carriers are swept and measured. Other frequency ranges in the RFBW are not measured. Left and right carriers are determined based on the carrier center frequencies If Measure Carriers of all the carriers in a sub-block are off, the reference power in a sub-block and all the relative power results are `NaN`. Relative limits are not evaluated
Max Power Carrier	`MPCarrier`	Maximum carrier power is the reference of measurement. All the configured carriers are measured If Measure Carriers of all the carriers are off, the reference power and all the relative power results are `NaN`. Relative limits are not evaluated
Carrier Index	`CINDex`	Power of the specified carrier is the reference of measurement. Only the frequency range of the specified carrier is swept and measured, and other frequency ranges in the RFBW are not measured If Measure Carriers of this carrier index is off, the reference power and all the relative power results are `NaN`. Relative limits are not evaluated
Manual	`MANual`	Power or PSD specified by the user is the reference of measurement. No carriers are measured and the manually specified value is used as reference
Max Power Carrier in Sub-block	`MPCSubblock`	Maximum carrier power among the sub-block carriers with Measure Carrier On is the reference of measurement. All the configured carriers are measured If Measure Carriers of all the carriers in a sub-block are off, the reference power of the sub-block and all the relative power results referring to this sub-block are `NaN`, and these relative limits are not evaluated
RF Bandwidth	`RFBandwidth`	Power or PSD of total of the RF bandwidth is the reference of measurement. Power not only in the carrier bands but also carrier gaps is integrated into the reference power. Measure Carrier On/Off does not affect the reference power frequency range because RF bandwidth is determined by the carrier configuration
Aggregated Chan BW LTE-A and 5G NR Modes only	`ACBandwidth`	The assigned aggregated channel bandwidth power which is measured with a rectangular filter with measurement bandwidth specified as aggregated channel bandwidth based on the definition of each 3GPP standard. Calculated from the carrier configuration including SCS (Power Meas), the smallest SCS among the enabled SCSs of the selected component carrier. Measure Carrier On/Off affects the reference power frequency range

<table>
<tr><th>Option</th><th>SCPI</th><th>Description</th></tr>
<tr><td></td><td></td><td>If Measure Carriers of all the carriers are off, the reference power and all the relative power results are <code>NaN</code> and Relative limits are not evaluated</td></tr>
<tr><td>Left & Right Sub-blocks
5G NR Mode only</td><td><code>LRSubblocks</code></td><td>The reference depends on the Number of Component Carriers (CC) and Carrier Allocation as follows:
<table>
<tr><th>Number of CCs</th><th>Reference</th></tr>
<tr><td>1</td><td>The carrier power is the reference</td></tr>
<tr><td>2 or more, <i>and</i>
Carrier Allocation is Contiguous</td><td>Aggregated Channel power is the reference</td></tr>
<tr><td>2 or more, <i>and</i>
Carrier Allocation is Non-Contiguous</td><td>Aggregated powers of left and right sub-blocks are the references. Left and right sub-blocks are determined by component carrier configuration</td></tr>
</table>
</td></tr>
</table>

The powers of carriers are not included in the reference power when their Measure Carriers are **Off**. When Measure Carriers of all the carriers in a sub-block are **Off**, the reference power and all the relative power results are `NaN`. Therefore, relative limits are not evaluated.

Meas Type = Total Power Ref

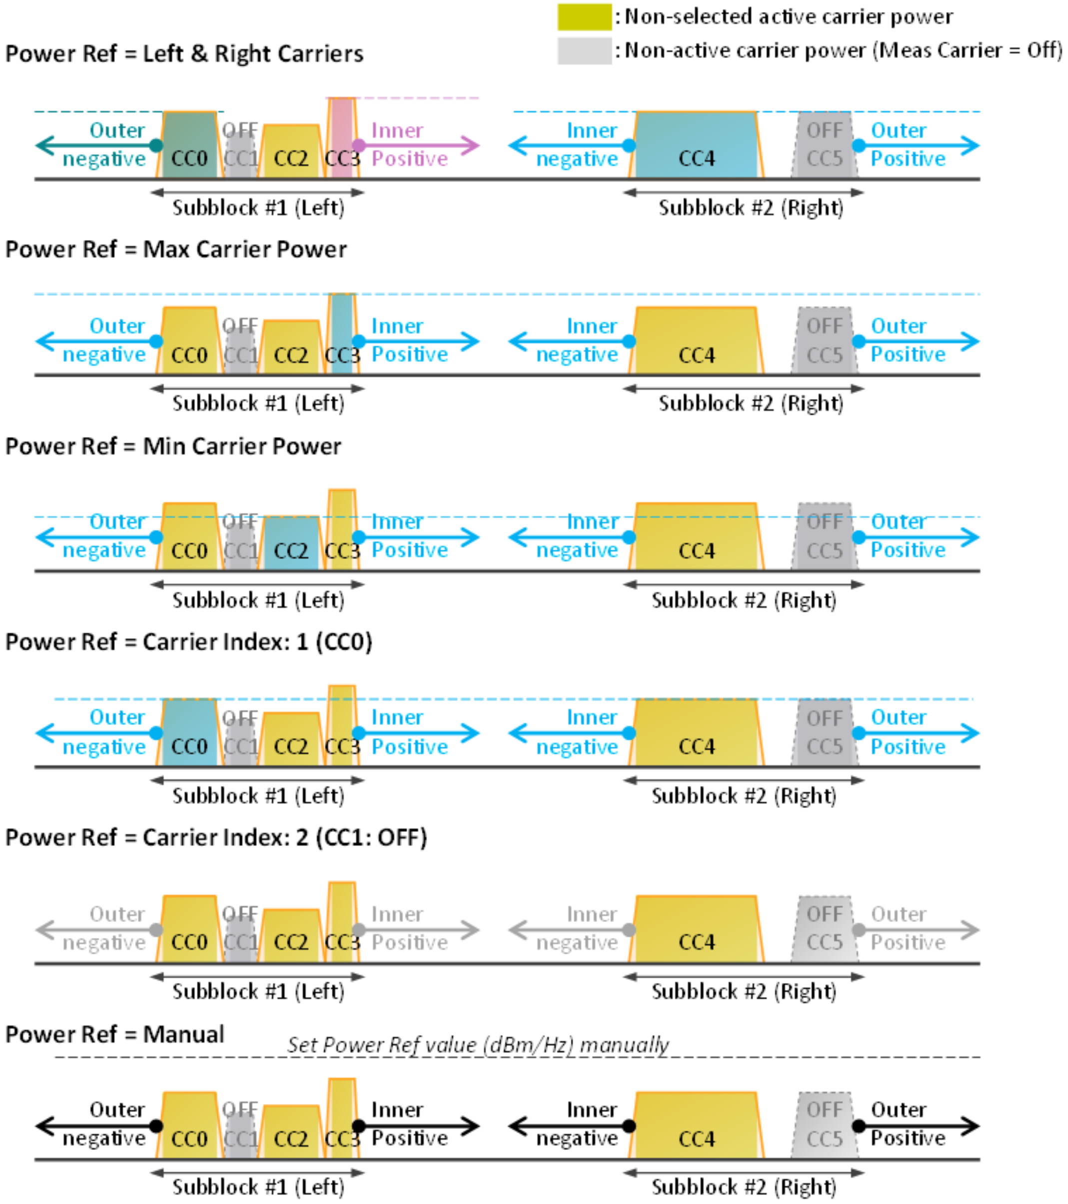
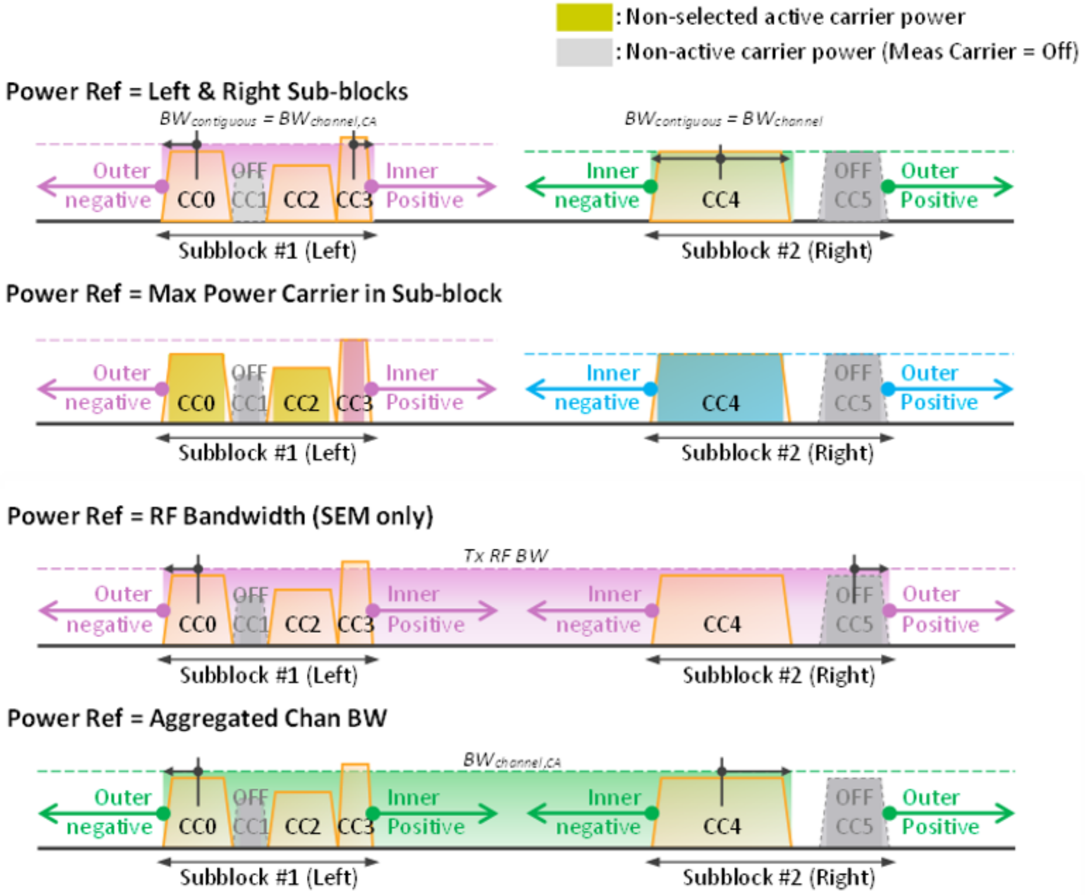
Meas Type = PSD Ref





Remote Command	`[:SENSe]:SEMask:CARRier:PREFerence:TYPE LRCarriers | MPCarrier | CINDex | MANual | MPCSubblock | RFBandwidth | ACBandwidth | LRSubblocks`
	For option details, see above
	`[:SENSe]:SEMask:CARRier:PREFerence:TYPE?`

Example	`:SEM:CARR:PREF:TYPE CIND` `:SEM:CARR:PREF:TYPE?`
Notes	`LRSubblocks` is available only in 5G NR Mode `ACBandwidth` is available only in LTE-A and 5G NR Modes
Dependencies	Only available in MSR, LTE-A and 5G NR Modes
Preset	`MPCarrier`
State Saved	Saved in instrument state
Range	Left & Right Carriers | Max Power Carriers | Carrier Index | Manual | Max Power Carrier in Sub-block | RF Bandwidth | Aggregated Chan BW | Left & Right Sub-blocks

Remote Command	`[:SENSe]:SEMask:CARRier:AUTO[:STATe] OFF | ON | 1 | 0` `[:SENSe]:SEMask:CARRier:AUTO[:STATe]?`

Example	`:SEM:CARR:AUTO OFF` `:SEM:CARR:AUTO?`
Preset	`ON`
State Saved	Saved in instrument state
Range	Auto|Man

Carrier Index

Sets carrier index of the reference power. The power of the carrier selected by this index becomes reference power when "Power Ref" on page 930 is Carrier Index.

Remote Command	`[:SENSe]:SEMask:CARRier:INDex <integer>` `[:SENSe]:SEMask:CARRier:INDex?`
Example	`:SEM:CARR:IND 1` `:SEM:CARR:IND?`
Dependencies	Available only in MSR, LTE-A and 5G NR Modes
Preset	1
State Saved	Saved in instrument state
Min/Max	MSR Mode: 1/100 LTEAFDD,LTEATDD Mode:1/5 5G NR Mode: 16

Total Power Ref

Sets the power in the carrier (ref channel) that is used to compute the relative power values for the offsets. For modes other than MSR, LTEAFDD, LTEATDD, and 5GNR, when **Reference Power** is set to Measured, this value is set to the measured carrier reference power. When set to Manual, the result takes on the last measured value, or can be manually entered.

For WLAN 802.11ac (80 MHz + 80 MHz), the higher of the power readouts of the two carriers is used for computing the relative power values for the offset.

Remote Command	`[:SENSe]:SEMask:CARRier[:POWer] <real>` `[:SENSe]:SEMask:CARRier[:POWer]?`
Example	`:SEM:CARR 100dBm` `:SEM:CARR?`
Notes	The min and max values given are for "Measurement Type" on page 929 = Total Pwr Ref
Couplings	Coupled with **Measurement Type**. Active when **Measurement Type** is set to Total Power Ref. Otherwise, grayed-out

	In MSR, LTE-A and 5G NR Modes, the control is active when **Measurement Type** is set to Total Power and **Power Ref** is set to Manual
Preset	Measured carrier reference power
State Saved	Saved in instrument state
Min/Max	-200 dBm/200 dBm
Annotation	Value is displayed on the left top of the Results window with the Channel Integ BW

PSD Ref

Sets the power spectral density in the carrier that is used to compute the relative power spectral density values for the offsets when "Measurement Type" on page 929 is set to PSD Ref. When the state is set to **Auto**, this will be set to the measured carrier power spectral density.

For WLAN 802.11ac (80 MHz + 80 MHz), the higher of the power density readouts of the two carriers is used for computing the relative PSD values for the offset.

Remote Command	`[:SENSe]:SEMask:CARRier:CPSD <real>` `[:SENSe]:SEMask:CARRier:CPSD?`
Example	`:SEM:CARR:CPSD -80` `:SEM:CARR:CPSD?`
Notes	Although the default value is defined, the value is recalculated by the measurement result just after completing the measurement Carrier sub op code. 1 for BTS, 2 for MS. Default is BTS
Couplings	Coupled with "Measurement Type" on page 929. Active if **Measurement Type** is PSD. Otherwise, grayed-out In MSR, LTE-A and 5G NR Modes, active when **Measurement Type** is PSD and **Power Ref** is Manual
Preset	Measured carrier PSD reference power
State Saved	Saved in instrument state
Min/Max	-200/200
Annotation	Value is displayed on the right top of the Results window. If Meas Type selection is PSD Ref, the string is “PSD Ref” with BOLD font, otherwise, hide annotation

Spectrum Pk Ref

Sets the spectrum peak power in the carrier that is used to compute the relative power spectral density values for the offsets when "Measurement Type" on page 929 is Spectrum Peak. When the state is set to **Auto**, this is set to the measured carrier spectrum peak power. When set to **Manual**, the result takes on the last measured value, or can be manually entered

Remote Command	`[:SENSe]:SEMask:CARRier:PEAK[:POWer] <real>` `[:SENSe]:SEMask:CARRier:PEAK[:POWer]?`
Example	`:SEM:CARR:PEAK -80` `:SEM:CARR:PEAK:POWER?`
Notes	Although the default value is defined, the value is recalculated by the measurement result just after completing the measurement Carrier sub op code. 1 for BTS, 2 for MS. Default is BTS
Couplings	Coupled with "Measurement Type" on page 929. Active when **Measurement Type** is "Spectrum Peak Ref". Otherwise, grayed-out In MSR, LTE-A and 5G NR Modes, active when **Measurement Type** is Spectrum Peak Ref and **Power Ref** is Manual
Preset	Measured carrier Spectrum Peak reference power
State Saved	Saved in instrument state
Min/Max	-200/200
Annotation	Value is displayed on the right top of the Results window. If Meas Type selection is Spectrum Peak Ref, the string is “Spectrum Peak Ref” with BOLD font, otherwise, hide annotation

Measure All Ref Carriers

When ON, all reference carriers configured are always measured irrespective of Measure Carrier on/off settings.

Remote Command	`[:SENSe]:SEMask:CARRier:MEASure:ALL ON | OFF | 1 | 0` `[:SENSe]:SEMask:CARRier:MEASure:ALL?`
Example	`:SEM:CARR:MEAS:ALL 1` `:SEM:CARR:MEAS:ALL?`
Dependencies	Only available in MSR, LTE-A and 5G NR Modes
Preset	0
State Saved	Saved in instrument state

Offset/Limits Config Table

This function is the same as "Offset/Limits Config Table" on page 852 under the "Settings" on page 848 tab.

Sets the power reference in the carrier that will be used to compute the relative values for the offsets.

3.5.23.4 Radio

Contains controls to select link direction.

Direction

Specifies whether the LTE-Advanced signal is an uplink signal or a downlink signal.

The choice of link direction determines the Sync/Format, Chan Profile and Time. Advanced menus all change based on the link direction selected. Also, since downlink and uplink signals use OFDMA and SC-FDMA respectively, the list of trace results available and the default traces presented change based on the link direction parameter.

Remote Command	`[:SENSe]:RADio:STANdard:DIRection DLINk | ULINk` `[:SENSe]:RADio:STANdard:DIRection?`
Example	`:RAD:STAN:DIR DLIN`
Couplings	TDD: Changing direction affects the sync source of periodic trigger source or gate source If Direction is uplink, the sync source is RF burst If Direction is downlink, the sync source is External1 If direction is downlink, the menu Measure PRACH/SRS is disabled and the value is off FDD/TDD: Changing Direction affects many other modulation analysis setup parameters
Preset	DLIN ULIN on E6640A DLIN on E6650A
State Saved	Yes
Range	Downlink|Uplink For E6640A, Direction is restricted to Uplink only, Downlink is not selectable For E6650A, Direction is restricted to Downlink only, Uplink is not selectable

Interfering Signal Present

Sets whether interfering signal for the intermodulation tests exists or not. If exists, limits are not evaluated over the interference signal frequency range specified by the span and the center frequency parameters in ACP, SEM and Spurious Emissions.

Remote Command	`[:SENSe]:RADio:IMODulation:INTerference[:STATe] OFF | ON | 0 | 1` `[:SENSe]:RADio:IMODulation:INTerference[:STATe]?`
Example	`:RAD:IMOD:INT 1` `:RAD:IMOD:INT?`
Preset	OFF
State Saved	Saved in instrument state
Range	Yes|No

Freq Offset from Edge

Sets the center frequency of the interference signal for intermodulation tests. The frequency is set as offset frequency from the BS RF bandwidth edge. Interference Offset Side determines on which side of the BS RF bandwidth the interference signal exists.

Remote Command	`[:SENSe]:RADio:IMODulation:INTerference:FREQuency:OFFSet <freq>` `[:SENSe]:RADio:IMODulation:INTerference:FREQuency:OFFSet?`
Example	`:RAD:IMOD:INT:FREQ:OFFS 5MHz` `:RAD:IMOD:INT:FREQ:OFFS?`
Preset	5MHz
State Saved	Saved in instrument state
Min/Max	0 Hz / 20.0 MHz

Span

Sets the span of the interference signal for intermodulation tests.

Remote Command	`[:SENSe]:RADio:IMODulation:INTerference:SPAN <freq>` `[:SENSe]:RADio:IMODulation:INTerference:SPAN?`
Example	`:RAD:IMOD:INT:SPAN 5MHz` `:RAD:IMOD:INT:SPAN?`
Preset	5 MHz
State Saved	Saved in instrument state
Min/Max	200 kHz / 20.0 MHz

Offset Side

Sets which side of the BS RF bandwidth the interference signal exists on.

Remote Command	`[:SENSe]:RADio:IMODulation:INTerference:SIDE NEGative | POSitive` `[:SENSe]:RADio:IMODulation:INTerference:SIDE?`
Example	`:RAD:IMOD:INT:SIDE POS` `:RAD:IMOD:INT:SIDE?`
Preset	POSitive
State Saved	Saved in instrument state

Non-Contiguous Interference Region

Sets the region the interfering signal exists at in the Non-Contiguous mode:

- INNer – The interfering signal exists at the inner region. This setting is only effective when Carrier Alloc is Non-Contiguous. When in Contiguous, the interference region is always outside regardless of the selection of this parameter
- OUTer – The interfering signal exists at either of the outer regions

Remote Command	`[:SENSe]:RADio:IMODulation:INTerference:REGion INNer | OUTer` `[:SENSe]:RADio:IMODulation:INTerference:REGion?`
Example	`:RAD:IMOD:INT:REG OUT` `:RAD:IMOD:INT:REG?`
Preset	OUTer
State Saved	Saved in instrument state

3.5.23.5 Component Carriers

Contains settings that let you configure the analyzer to match the component carriers in your LTE-A signal.

Number of Component Carriers

Specifies how many component carriers are included in LTE-Advanced TDD/FDD measurements. Each component carrier complies with the LTE specifications.

LTE-Advanced TDD/FDD supports a maximum of five component carriers, so the maximum transmission bandwidth is up to 100 MHz.

Remote Command	`[:SENSe]:CCARrier:COUNt <integer>` `[:SENSe]:CCARrier:COUNt?`
Example	`:CCAR:COUN 1` `:CCAR:COUN?`
Notes	The max number of Component carriers can be set greater than one with 9080B/9082B-2FP license
Preset	1
State Saved	Yes
Min	1
Max	5

Carrier Allocation

Specifies the carrier frequency allocation. There are two types of allocation, contiguous and non-contiguous. Non-Contiguous frequency allocation is defined as an allocation where two sub-blocks are separated with a sub-block gap:

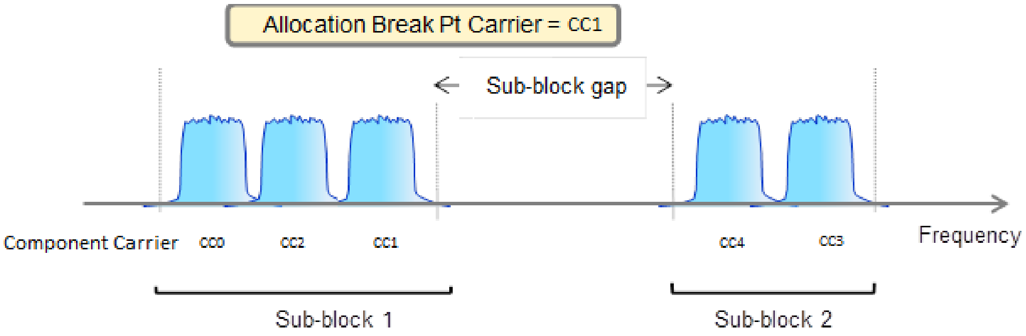
- CONTiguous – All the component carriers belong to one block and no sub-block gap exists
- NCONtiguous – Component carriers are separated into two sub-blocks. Allocation Break Pt Carrier determines how sub-blocks are configured

Remote Command	`[:SENSe]:CCARrier:CONFig:ALLocation CONTiguous | NCONtiguous` `[:SENSe]:CCARrier:CONFig:ALLocation?`
Example	`:CCAR:CONF:ALL CONT` `:CCAR:CONF:ALL?`
Preset	CONTiguous
State Saved	Saved in instrument state
Range	Contiguous|Non-Contiguous

Non-Contiguous Break at

Specifies an allocation break point in non-contiguous carrier allocation. First sub-block starts from the lowest frequency carrier and stops at the allocation break point carrier. Next sub-block starts from the next upper frequency carrier and ends at the highest frequency carrier.

one example is shown below. In the example carrier indices are not in the order of carrier frequency. In the example, Allocation Break Pt Carrier is CC1. It means that sub-block 1 ends at carrier CC1 and sub-block 2 starts at carrier CC4. Sub-block gap is located between carrier CC1 and CC4.



Remote Command	`[:SENSe]:CCARrier:CONFig:ALLocation:NCONtiguous:ABPoint CC0 | … | CC4`

	`[:SENSe]:CCARrier:CONFig:ALLocation:NCONtiguous:ABPoint?`
Example	`:CCAR:CONF:ALL:NCON:ABP CC0` `:CCAR:CONF:ALL:NCON:ABP?`
Notes	The options CC1~CC4 can be enabled with 9080B/9082B-2FP license
Dependencies	Allocation Break Point is coupled to Number of Component Carriers. For example, Allocation Break Point list will include CC0~CC1 if the number of Component Carriers is 2
Preset	CC0
State Saved	Saved in instrument state
Range	CC0|CC1|CC2|CC3|CC4

Configure Comp Carriers

Lets you perform a detailed configuration of your component carriers, including number of carriers, presets, bandwidth, offset, integration bandwidth, etc.

Configure CCs

Lets you configure System Bandwidth, frequency offsets, and integration bandwidth, and also lets you exclude certain carriers from the measurement.

Number of Component Carriers

See "Number of Component Carriers" on page 2245.

Carrier Allocation

See "Carrier Allocation" on page 2245.

Non-Contiguous Break at

See "Non-Contiguous Break at" on page 2246.

System BW

Enables you to set the system bandwidth of each component carrier for LTE-Advanced / NB-IoT signal (which also determines the total number of resource blocks for Modulation Analysis measurement).

Remote Command	`[:SENSe]:CCARrier0|…|4:RADio:STANdard:BANDwidth B1M4 | B3M | B5M | B10M | B15M | B20M | B200K`

	`[:SENSe]:CCARrier0|…|4:RADio:STANdard:BANDwidth?`
Example	`:CCAR4:RAD:STAN:BAND B5M`
Preset	B5M
State Saved	Yes
Range	1.4 MHz (6 RB) | 3 MHz (15 RB) | 5 MHz (25 RB) | 10 MHz (50 RB) | 15 MHz (75 RB) | 20 MHz (100 RB) | 200kHz (NB-IoT)
Backwards Compatibility SCPI	`[:SENSe]:RADio:STANdard:BANDwidth`

Measure Carrier

Sets whether to measure this component carrier or not.

Remote Command	`[:SENSe]:CCARrier0|…|4[:STATe] OFF | ON | 0 | 1` `[:SENSe]:CCARrier0|…|4[:STATe]?`
Example	`:CCAR0 ON` `:CCAR0?`
Notes	The command is used with a sub-op code <n> (default=0) to specify the component carrier for configuration. The range of the sub-op code is determined by the number of component carriers
Preset	ON
State Saved	Saved in instrument state
Range	On|Off

Frequency Offset

Sets the component carrier center frequency as offset from the Carrier Ref Frequency.

Remote Command	`[:SENSe]:CCARrier<n>:FREQuency:OFFSet <freq>` `[:SENSe]:CCARrier<n>:FREQuency:OFFSet?`
Example	`:CCAR4:FREQ:OFFS 10MHz` `:CCAR4:FREQ:OFFS?`
Notes	Used with a sub-op code <n> (default=0) to specify the component carrier for configuration. The range of the sub-op code is determined by the number of component carriers
Preset	0Hz
State Saved	Saved in instrument state
Min	-3.5GHz
Max	3.5GHz

Spectrum

Determines if the spectrum of the incoming data is mirrored or not. The actual mirroring is accomplished by conjugating the complex time data.

Note that only the Modulation Analysis measurement and Conformance EVM measurement support this feature.

Remote Command	`[:SENSe]:CCARrier0|…|4:SPECtrum NORMal	INVert` `[:SENSe]:CCARrier0|…|4:SPECtrum?`
Example	`:CCAR0:SPEC INV` `:CCAR0:SPEC?`
Preset	NORM
State Saved	Yes
Range	Normal | Invert
Backwards Compatibility SCPI	`[:SENSe]:SPECtrum`

UL/DL Configuration

Allows you to set the Uplink and Downlink allocation configuration of the signal being measured. The choice of link direction will determine which slot in the frame is used for uplink transmission, and which slot for downlink transmission.

Remote Command	`[:SENSe]:CCARrier0|…|4:RADio:STANdard:ULDL CONF0	…	CONF6` `[:SENSe]:CCARrier0|…|4:RADio:STANdard:ULDL?`
Example	`:CCAR0:RAD:STAN:ULDL CONF0`
Notes	CONF0: Configuration 0 (DSUUUDSUUU) CONF1: Configuration 1 (DSUUDDSUUD) CONF2: Configuration 2 (DSUDDDSUDD) CONF3: Configuration 3 (DSUUUDDDDD) CONF4: Configuration 4 (DSUUDDDDDD) CONF5: Configuration 5 (DSUDDDDDDD) CONF6: Configuration 6 (DSUUUDSUUD)
Preset	CONF0
State Saved	Yes
Range	Configuration 0|Configuration 1|Configuration 2|Configuration 3|Configuration 4|Configuration 5|Configuration 6
Backwards Compatibility SCPI	`[:SENSe]:RADio:STANdard:ULDL`

Dw/GP/Up Len

This control allows you to set the DwPTS/GP/UpPTS length configuration of the signal being measured. The choice of link direction will determine the length of DwPTS, GP and UpPTS in the Special Subframe.

Remote Command	`[:SENSe]:CCARrier0|…|4:RADio:STANdard:DGPU CONF0 | … | CONF9` `[:SENSe]:CCARrier0|…|4:RADio:STANdard:DGPU?`
Example	`:CCAR0:RAD:STAN:DGPU CONF0`
Notes	CONF0: Configuration 0 CONF1: Configuration 1 CONF2: Configuration 2 CONF3: Configuration 3 CONF4: Configuration 4 CONF5: Configuration 5 CONF6: Configuration 6 CONF7: Configuration 7 CONF8: Configuration 8 CONF9: Configuration 9
Dependencies	The special sub-frame configuration 9 is only enabled when it is LTE-Advanced TDD
Preset	CONF0
State Saved	Yes
Range	Configuration 0|Configuration 1|Configuration 2|Configuration 3|Configuration 4|Configuration 5|Configuration 6|Configuration 7|Configuration 8|Configuration 9
Backwards Compatibility SCPI	`[:SENSe]:RADio:STANdard:DGPU`

CHP Power Integ BW

Specifies the range of integration used in calculating the power in the component carrier s in the CHP measurement.

Remote Command	`[:SENSe]:CCARrier0|…|4:CHPower:BANDwidth:INTegration <freq>` `[:SENSe]:CCARrier0|…|4:CHPower:BANDwidth:INTegration?`
Example	`:CCAR0:CHP:BAND:INT 20MHz` `:CCAR0:CHP:BAND:INT?`
Notes	You must be in LTEATDD/LTEAFDD Mode to use this command. Use :INSTrument:SELect to set the mode
Couplings	When System Bandwidth of the parameter set is changed, the value of this parameter also changes as shown in the following table.

	<table><tr><th>System Bandwidth</th><th>CHP Integ BW</th></tr><tr><td>1.4 MHz (B1M4)</td><td>1.4 MHz</td></tr><tr><td>3 MHz (B3M)</td><td>3 MHz</td></tr><tr><td>5 MHz (B5M)</td><td>5 MHz</td></tr><tr><td>10 MHz (B10M)</td><td>10 MHz</td></tr><tr><td>15 MHz (B15M)</td><td>15 MHz</td></tr><tr><td>20 MHz (B20M)</td><td>20 MHz</td></tr><tr><td>200 kHz(B200K)</td><td>200 kHz</td></tr></table>
Preset	5 MHz
State Saved	Saved in instrument state
Min	100 kHz
Max	20 MHz
Backwards Compatibility SCPI	`[:SENSe]:CHPower:BANDwidth:INTegration` `[:SENSe]:CHPower:BWIDth:INTegration`

ACP Power Integ BW

Specifies the Measurement Noise Bandwidth used to calculate the power in the component carriers in the ACP measurement.

Remote Command	`[:SENSe]:CCARrier0|…|4:ACPower:BANDwidth[1]|2:INTegration <freq>` `[:SENSe]:CCARrier0|…|4:ACPower:BANDwidth[1]|2:INTegration?`
Example	`:CCAR0:ACP:BAND:INT 20MHz` `:CCAR0:ACP:BAND:INT?`
Notes	Carrier sub op code, 1 is for BTS, 2 for MS. Default is BTS You must be in the LTEATDD/LTEAFDD mode. Use :INSTrument:SELect to set the mode
Couplings	When System Bandwidth of the parameter set is changed, the value of this parameter also changes as shown in the following table.

System Bandwidth	BTS ACP Meas Noise BW	MS ACP Meas Noise BW
1.4 MHz (B1M4)	1.095 MHz	1.08 MHz
3 MHz (B3M)	2.715 MHz	2.7 MHz
5 MHz (B5M)	4.515 MHz	4.5 MHz
10 MHz (B10M)	9.015 MHz	9.0 MHz
15 MHz (B15M)	13.515 MHz	13.5 MHz
20 MHz (B20M)	18.015 MHz	18.0 MHz
200 kHz(B200K)	180 kHz	180 kHz

Preset	4.515 MHz|4.5 MHz
State Saved	Yes
Min	100 kHz
Max	20 MHz
Backwards Compatibility SCPI	`[:SENSe]:ACPower:CARRier[1]|2:LIST:BANDwidth[:INTegration]` `[:SENSe]:ACPower:CARRier[1]|2:LIST:BWIDth[:INTegration]`

SEM Power Integ BW

Specifies the integration bandwidth used to calculate the power in the component carriers in SEM measurement.

Remote Command	`[:SENSe]:CCARrier0|…|4:SEMask:BANDwidth[1]|2:INTegration <freq>` `[:SENSe]:CCARrier0|…|4:SEMask:BANDwidth[1]|2:INTegration?`
Example	`:CCAR0:SEM:BAND:INT 20MHz` `:CCAR0:SEM:BAND:INT?`
Notes	Bandwidth sub op code, 1 is for BTS, 2 for MS. Default is BTS You must be in LTEATDD/LTEAFDD Mode to use this command. Use :INSTrument:SELect to set the mode
Couplings	When System Bandwidth of the parameter set is changed, the value of this parameter also changes as shown in the following table. Note that you cannot set the value exceeding the corresponding System Bandwidth

System Bandwidth	BTS SEM Integ BW	MS SEM Integ BW
1.4 MHz (B1M4)	1.095 MHz	1.08 MHz
3 MHz (B3M)	2.715 MHz	2.7 MHz
5 MHz (B5M)	4.515 MHz	4.5 MHz
10 MHz (B10M)	9.015 MHz	9.0 MHz
15 MHz (B15M)	13.515 MHz	13.5 MHz
20 MHz (B20M)	18.015 MHz	18.0 MHz
200 kHz(B200K)	180 kHz	180 kHz

Preset	4.515 MHz|4.5 MHz
State Saved	Saved in instrument state
Min	100 kHz
Max	20 MHz
Backwards Compatibility SCPI	`[:SENSe]:SEMask:BANDwidth[1]|2:INTegration`

Carrier Config Presets

Lets you configure the Component Carrier presets.

Preset ETC

The ETC configuration is applied. The component carrier parameters are dynamically changed using values of the parameters of each test configuration under Carrier Config Presets menu when some test configuration is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig NONE | ETC1 | ETC2 | ETC3` `[:SENSe]:CCARrier:CONFig?`
Example	`:CCAR:CONF ETC1` `:CCAR:CONF?`
Notes	The control for NONE is not available
State Saved	Saved in instrument state
Range	ETC1|ETC2|ETC3

Max BTS RF Bandwidth

Sets max BS RF bandwidth used when the carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:RFBW <freq>` `[:SENSe]:CCARrier:CONFig:RFBW?`
Example	`:CCAR:CONF:RFBW 40MHz` `:CCAR:CONF:RFBW?`
Preset	40MHz
State Saved	Saved in instrument state
Min	1.4MHz
Max	200 MHz

Carrier Spacing Delta

Sets delta channel spacing used when the carrier configuration preset runs. Channel spacing is determined from this value and the default channel spacing defined in the standard, i.e. Channel spacing = (BW_{chan1} + BW_{chan2}) * 0.5 + [the delta spacing]. Since this value is a difference from the default spacing, this value can be negative to allow narrower channel spacing. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:SPACing:DELTa <freq>` `[:SENSe]:CCARrier:CONFig:SPACing:DELTa?`
Example	`:CCAR:CONF:SPAC:DELT -200kHz` `:CCAR:CONF:SPAC:DELT?`
Preset	0Hz
State Saved	Saved in instrument state
Min	-1.0 MHz
Max	10.0 MHz

ETC1 Attributes

Sets ETC1 carrier configuration.

Max Number of Component Carriers

Sets max component carriers placed when the ETC1 carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC1:CMAX <integer>` `[:SENSe]:CCARrier:CONFig:ETC1:CMAX?`
Example	`:CCAR:CONF:ETC1:CMAX 5` `:CCAR:CONF:ETC1:CMAX?`
Preset	5
State Saved	Saved in instrument state
Max	5
Min/Max	1

Component Carrier System BW

Sets bandwidth of the component carriers placed when the ETC1carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC1:BANDwidth B1M4 | B3M | B5M | B10M | B15M | B20M | B200K` `[:SENSe]:CCARrier:CONFig:ETC1:BANDwidth?`
Example	`:CCAR:CONF:ETC1:BAND B5M` `:CCAR:CONF:ETC1:BAND?`
Preset	B5M

State Saved	Saved in instrument state
Range	1.4MHz|3MHz|5MHz|10MHz|15MHz|20MHz|200kHz

Component Carrier Narrowest BW

Sets narrowest bandwidth of the component carriers placed when the ETC1 carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC1:BANDwidth:NARRowest B1M4 | B3M | B5M | B10M | B15M | B20M | B200K` `[:SENSe]:CCARrier:CONFig:ETC1:BANDwidth:NARRowest?`
Example	`:CCAR:CONF:ETC1:BAND:NARR B1M4` `:CCAR:CONF:ETC1:BAND:NARR?`
Preset	B1M4
State Saved	Saved in instrument state
Range	1.4MHz|3MHz|5MHz|10MHz|15MHz|20MHz|200kHz

ETC2 Attributes

Sets ETC2 carrier configuration.

Max Number of Component Carriers

Sets max component carriers placed when the ETC2 carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC2:CMAX <integer>` `[:SENSe]:CCARrier:CONFig:ETC2:CMAX?`
Example	`:CCAR:CONF:ETC2:CMAX 5` `:CCAR:CONF:ETC2:CMAX?`
Preset	5
State Saved	Saved in instrument state
Min	1
Max	5

Carrier Side (with BTS RF BW)

Select the side of RF bandwidth to place the ETC2 component carriers. When this value is changed, the carrier configuration preset is initiated.

  - NEGative - Negative (lower) edge of RF bandwidth. If the option is selected, the available component carriers will be placed sequentially from the lower edge of the RF bandwidth starting from first
  - POSitive - Positive (upper) edge of RF bandwidth, If the option is selected, the available component carriers will be placed sequentially from the upper edge of the RF bandwidth starting from first

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC2:BANDwidth:SIDE NEGative | POSitive` `[:SENSe]:CCARrier:CONFig:ETC2:BANDwidth:SIDE?`
Example	`:CCAR:CONF:ETC2:BAND:SIDE NEG` `:CCAR:CONF:ETC2:BAND:SIDE?`
Preset	NEGative
State Saved	Saved in instrument state
Range	NEGative|POSitive

Component Carrier System BW

Sets carrier bandwidth of the component carriers placed when the ETC2 carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC2:BANDwidth:CARRier[1]|2|…|5 B1M4 | B3M | B5M | B10M | B15M | B20M | B200K` `[:SENSe]:CCARrier:CONFig:ETC2:BANDwidth:CARRier?`
Example	`:CCAR:CONF:ETC2:BAND:CARR B5M` `:CCAR:CONF:ETC2:BAND:CARR?`
Dependencies	The Carrier Bandwidth is coupled to Max Component Carriers. The settings are enabled following the Max Component Carriers. For example, the 1st Carrier Bandwidth and 2nd Carrier Bandwidth will be available if the Max Component Carriers is 2
Preset	B5M
State Saved	Saved in instrument state
Range	1.4MHz|3MHz|5MHz|10MHz|15MHz|20MHz|200kHz

ETC3 CC Bandwidth

Sets the bandwidth of the component carriers placed when the ETC3 carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC3:BANDwidth B1M4 | B3M | B5M | B10M | B15M | B20M | B200K`

	`[:SENSe]:CCARrier:CONFig:ETC3:BANDwidth?`
Example	`:CCAR:CONF:ETC3:BAND B5M` `:CCAR:CONF:ETC3:BAND?`
Preset	B5M
State Saved	Saved in instrument state
Range	1.4MHz|3MHz|5MHz|10MHz|15MHz|20MHz|200kHz

3.5.23.6 Meas Standard

Enables you to access Preset to Standard functions.

In LTE-Advanced TDD Mode, the parameters under Predefined Params impact the gate or trigger length and delay of the following measurements:

- Monitor Spectrum
- Channel Power
- ACP
- Power Stat CCDF
- Occupied BW
- Spectrum Emission Mask
- Spurious Emission

In LTE-Advanced FDD Mode, the Predefined Parameters in this section are used in the Transmit On/Off Power measurement. The Modulation Analysis measurement has its specific Predefined Parameters setting.

In LTE V2X Mode, Predefined parameters apply to all LTE V2X measurements.

System BW

Sets the demodulator to the specified bandwidth and configures the settings of every component carrier according to the default values listed in table for the current direction (Uplink or Downlink).

For example, when Number of Component is 3, after executing the command RAD:STAN:PRES B5M or selecting corresponding Bandwidth in the dropdown menu, all the 3 component carriers are configured as 5Mhz bandwidth, and all the settings of these 3 component carriers are set according to the table.

Remote	`[:SENSe]:RADio:STANdard:PRESet B1M4 | B3M | B5M | B10M | B15M | B20M | B200K`

Command	
Example	`:RAD:STAN:PRES B5M`
Notes	B200K selection is available in LTE-A FDD mode B200K option is for NB-IoT which requires N9080EM3E license
Couplings	Preset To Standard presets parameter values listed in section "Values for each Preset To Standard". And the system bandwidth of each component carrier under the Component Carrier Setup will be preset to the selected one
Preset	B5M
State Saved	Yes
Range	1.4 MHz (6 RB) | 3 MHz (15 RB) | 5 MHz (25 RB) | 10 MHz (50 RB) | 15 MHz (75 RB) | 20 MHz (100 RB) | 200 kHz (NB-IoT)

UL/DL Config

Sets the TDD UL/DL Allocation parameter of each carrier to the selected value.

Remote Command	`[:SENSe]:RADio:STANdard:PRESet:ULDL CONF0 | … | CONF6` `[:SENSe]:RADio:STANdard:PRESet:ULDL?`
Example	`:RAD:STAN:PRES:ULDL CONF0`
Notes	CONF0: Configuration 0 (DSUUUDSUUU) CONF1: Configuration 1 (DSUUDDSUUD) CONF2: Configuration 2 (DSUDDDSUDD) CONF3: Configuration 3 (DSUUUDDDDD) CONF4: Configuration 4 (DSUUDDDDDD) CONF5: Configuration 5 (DSUDDDDDDD) CONF6: Configuration 6 (DSUUUDSUUD)
Dependencies	When the setting is selected, the ULDL Alloc per component carrier under the Component carrier Setup will be preset to the selected value
Preset	CONF0
State Saved	Yes
Range	Configuration 0|Configuration 1|Configuration 2|Configuration 3|Configuration 4|Configuration 5|Configuration 6

Dw/GP/Up Len

Sets the TDD special sub-frame configuration of each component carrier to the selected value.

Remote Command	`[:SENSe]:RADio:STANdard:PRESet:DGPU CONF0 | … | CONF9` `[:SENSe]:RADio:STANdard:PRESet:DGPU?`

Example	`:RAD:STAN:PRES:DGPU CONF0`
Notes	CONF0: Configuration 0 CONF1: Configuration 1 CONF2: Configuration 2 CONF3: Configuration 3 CONF4: Configuration 4 CONF5: Configuration 5 CONF6: Configuration 6 CONF7: Configuration 7 CONF8: Configuration 8 CONF9: Configuration 9
Dependencies	When the setting is selected, the Dw/GP/Up Len per Component Carrier under the Component Carrier Setup will be preset to the selected value The special sub-frame configuration 9 is only enabled when it is LTE-Advanced TDD
Preset	CONF0
State Saved	Yes
Range	Configuration 0|Configuration 1|Configuration 2|Configuration 3|Configuration 4|Configuration 5|Configuration 6|Configuration 7|Configuration 8|Configuration 9

Analysis Slot

Specifies the starting analysis slot. The measurement will adjust the gate delay or trigger delay according to this parameter.

Remote Command	`[:SENSe]:RADio:SLOT TS0 | TS1 | DPTS1 | UPTS1 | TS4 | TS5 | TS6 | TS7 | TS8 | TS9 | TS10 | TS11 | TS12 | TS13 | TS14 | TS15 | TS16 | TS17 | TS18 | TS19` `[:SENSe]:RADio:SLOT?`
Example	`:RAD:SLOT TS0`
Couplings	Measurement's gate length or meas interval will couple to the parameter
Preset	TS0
State Saved	Yes
Range	TS0 | TS1 | DwPTS1 | UpPTS1 | TS4 | TS5 | TS6 | TS7 | TS8 | TS9 | TS10 | TS11 | TS12(DwPTS2) | TS13 (UpPTS2) | TS14 | TS15 | TS16 | TS17 | TS18 | TS19

Meas Interval

This parameter specifies the desired slots count that needs to be analyzed. The measurement will adjust the gate length or meas interval according to this parameter.

For NB-IoT uplink cases scenarios, when Measure NPRACH is Off, this parameter indicates not only the slots' count to be analyzed, but the time elapse of the off power measurements as well.

In LTE-A FDD Mode, this parameter only appears in the Transmit On|Off Power measurement.

Remote Command	`[:SENSe]:RADio:MINTerval <integer>` `[:SENSe]:RADio:MINTerval`
Example	`:RAD:MINT 1`
Notes	The backwards compatible command [:SENSe]:PVTime:MINTerval is available in LTE FDD & LTE-A FDD Modes
Dependencies	This parameter is disabled when all the below conditions are met at the same time: – System BW is "200 kHz (NB-IoT)" – Direction is "uplink" – NB-IoT Subcarrier Spacing is "3.75kHz" – Meas NPRACH is "OFF"
Couplings	Disabled when the "Measure PRACH" is in scope and its value is not off, then the actual meas interval is the length PRACH or SRS channel For NB-IoT case scenario, when the parameter is disabled, its value is automatically determined by both Meas NPRACH: **Meas NPRACH** – **Meas Interval** Preamble0 – 3 slots Preamble1 – 4 slots
Preset	1
State Saved	Yes
Min	1
Max	20, when System BW is NOT "200 kHz (NB-IoT) 16, otherwise
Backwards Compatibility SCPI	LTE: `[:SENSe]:PVTime:MINTerval`

CP Length

Specifies whether the cyclic prefix is configured as NORMal or EXTended for power measurement. The parameter will affect the gate length or meas interval parameters.

In LTE-A FDD Mode, this parameter only appears in the Transmit On|Off Power measurement.

Remote Command	`[:SENSe]:RADio:CPLength NORMal | EXTended` `[:SENSe]:RADio:CPLength?`
Example	`:RAD:CPL NORM`
Notes	The backwards compatible SCPI command [:SENSe]:PVTime:CPLength is available in LTE FDD & LTE-A FDD Modes
Dependencies	Disabled when System BW is set to “200 kHz (NB-IoT)” and Direction is “uplink”
Couplings	Set to NORMal when System BW is set to “200 kHz (NB-IoT)”
Preset	NORMal
State Saved	Yes
Range	Normal|Extended
Backwards Compatibility SCPI	LTE: `[:SENSe]:PVTime:CPLength`

Measure PRACH/SRS

Specifies whether the analysis slot is used for PRACH channel or SRS and the PRACH preamble format of the analysis slot.

The measurement will adjust the gate length or meas interval according to this parameter.

Remote Command	`[:SENSe]:RADio:MEASure OFF | PPF0 | PPF1 | PPF2 | PPF3 | PPF4 | SRS | DSRS` `[:SENSe]:RADio:MEASure?`
Example	`:RAD:MEAS OFF`
Couplings	If direction is downlink, the control is disabled and the value is set to off If this control value is not off, Meas Interval is disabled
Preset	OFF
State Saved	Yes
Range	Off|Preamble 0|Preamble 1|Preamble 2|Preamble 3|Preamble 4|SRS|DSRS

Reference Config

Specifies which component carrier’s ULDL Allocation Configuration and Dw/Up Length Configuration settings are used to adjust time slot to be measured automatically. For Modulation Analysis measurement, this control specifies which CC is used as the reference CC for time alignment results.

In LTE-A FDD Mode, this parameter only appears in the Transmit On|Off Power and Modulation Analysis measurements.

Remote Command	`[:SENSe]:RADio:RCONfig CC0 | … | CC4`

	`[:SENSe]:RADio:RCONfig?`
Example	`:RAD:RCON CC0`
Notes	The options CC1~CC4 can be enabled with 9080B/9082B-2FP license
Dependencies	Reference Configuration is coupled to Number of Component Carriers. For example, reference configuration list will include CC0~CC1 if the number of Component Carriers is 2
Preset	CC0
State Saved	Yes
Range	CC0|CC1|CC2|CC3|CC4

3.5.23.7 Advanced

Contains controls for setting advanced instrument functions.

This tab does not appear in EXM, VXT.

Noise Floor Extension

Allows you to turn on/configure the **Noise Floor Extension** (NFE) function. Some Modes (such as Spectrum Analyzer Mode), support two states of NFE, Full and Adaptive. The ON state (in Modes that do not support Adaptive NFE) matches the FULL state (in Modes that *do* support Adaptive NFE).

In ON or FULL NFE, the expected noise power of the instrument (derived from a factory calibration) is subtracted from the trace data. This usually reduces the apparent noise level by about 10 dB in low band, and 8 dB in high band (>~3.6 GHz).

In Adaptive NFE, there is not the same dramatic visual impact on the noise floor as there is in Full NFE. Adaptive NFE controls the amount of correction that is applied based on other instrument settings like RBW, averaging and sweep time. Adaptive NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement, such as settings that provide more averaging. The result is that when not much averaging is being performed, the signal displays more like the NFE-off case; and when lots of averaging is being performed, the signal displays more like the full-NFE case.

Adaptive NFE (in Modes that support it) is recommended for general-purpose use. For fully ATE (automatic test equipment) applications, where the distraction of a person using the instrument is not a risk, Full NFE is recommended.

NFE works with any RBW, VBW, detector, any setting of Average Type, any amount of trace averaging, and any signal type. It is ineffective when the trace is not smoothed (smoothing processes include narrow VBWs, trace averaging, and long sweep times with the detector set to **Average** or **Peak**). It works best with extreme amounts of smoothing, and with the average detector, with Average Type set to **Power**.

In those cases where the cancellation is ineffective, it nonetheless has no undesirable side-effects. There is no significant speed impact to having **Noise Floor Extension**`ON`.

The best accuracy is achieved when substantial smoothing occurs in each point before trace averaging. Thus, when using the average detector, results are better with long sweep times and fewer trace averages. When using the sample detector, the VBW filter should be set narrow with less trace averaging, instead of a wide VBW filter with more trace averaging.

NOTE

Noise Floor Extension has no effect unless the RF Input is selected, therefore it does nothing when External Mixing is selected.

In Modes that support Adaptive NFE, the default state of NFE is Adaptive. In Modes that do not support Adaptive NFE, the default state of NFE is `OFF`. Prior to the introduction of Adaptive NFE (firmware version A.18.00), the default state of NFE was `OFF` for all Modes.

With the introduction of Adaptive NFE, the menu control is changed from On|Off to Full|Adaptive|Off. For SCPI Backwards Compatibility, the existing SCPI command to turn NFE on and off was retained, and a new command was added to set the state to turn Adaptive On and Off

`[:SENSe]:CORRection:NOISe:FLOor ON|OFF|1|0` is retained, default changed to On for modes which support Adaptive NFE

`[:SENSe]:CORRection:NOISe:FLOor:ADAPtive ON|OFF|1|0` is added (for certain Modes), default=On

FULL = `:CORRection:NOISe:FLOor ON plus :CORRection:NOISe:FLOor:ADAPtive ON`

Remote Command	`[:SENSe]:CORRection:NOISe:FLOor ON | OFF | 1 | 0` `[:SENSe]:CORRection:NOISe:FLOor?`
Example	`:CORR:NOIS:FLO ON`
Dependencies	Only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear, but the remote command will be accepted without error (but has no effect)
Couplings	When NFE is enabled in any Mode manually, a prompt is displayed reminding you to perform the Characterize Noise Floor operation if it is needed. If NFE is enabled via SCPI and a Characterize Noise Floor operation is needed, an error will be entered in the system error queue
Preset	Unaffected by **Mode Preset**. Turned `ON` at startup and by **Restore Mode Defaults** in Modes that support Adaptive. Turned `OFF` at startup and by **Restore Mode Defaults** in Modes that do not support Adaptive
State Saved	No

Remote Command	`[:SENSe]:CORRection:NOISe:FLOor:ADAPtive ON | OFF | 1 | 0` `[:SENSe]:CORRection:NOISe:FLOor:ADAPtive?`

Example	First turn NFE on, this is FULL mode:
	`:CORR:NOIS:FLO ON`
	Then set it to Adaptive:
	`:CORR:NOIS:FLO:ADAP ON`

Dependencies	Only available in Modes that support Adaptive NFE Only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear, but the remote command is accepted without error (but has no effect)
Couplings	Sending `:CORR:NOIS:FLO ON` turns NFE Adaptive `OFF` for backwards compatibility. To turn Adaptive `ON`, you must issue the commands in the proper order, as shown in the example above
Preset	Not affected by **Mode Preset**, but set to `ON` at startup and by **Restore Mode Defaults**
State Saved	No

More Information

The instrument is characterized in the factory (or during a field calibration) with a model of the noise, referred to the input mixer, versus frequency in each band and path combination. Bands are 0 (low band) and 1 through 4 (high band) in a 26.5 GHz instrument, for example. Paths include normal paths, preamp paths, the electronic attenuator, etc.

In most band/path combinations, the noise can be well characterized based on just two parameters and the instrument frequency response before compensation for frequency-dependent losses.

After the noise density at the input mixer is estimated, the effects of the input attenuator, RBW, detector, etc. are computed to get the estimated input-port-referred noise level.

In the simplest case, the measured power (signal plus analyzer noise) in each display point (bucket) is compensated by subtracting the estimated noise power, leaving just the signal power. This is the operation when the detector is **Average**, and the Average Type is set to **Power**.

In other cases, operation is often not quite as good but still highly effective. With peak detection, the noise floor is estimated based on the RBW and the duration of the bucket using the same equations used in the noise marker function. The voltage of the noise is subtracted from the voltage of the observed signal-plus-noise measurement to compute the estimated signal voltage. The peak detector is one example of processing that varies with detector to give good estimates of the signal level without the analyzer noise.

For best operation, the average detector and the power scale are recommended, as already stated. **Peak** detection for pulsed-RF can still give excellent effectiveness. FFT analysis does not work well, and does not do NFE well, with pulsed-RF signals, so this combination is not recommended. **Negative peak** detection is not very useful, either. **Sample** detection works well but is never better than the average detector because it does not smooth as well. The **Normal** detector is a combination of peak and negative peak behaviors and works about as well as these.

For best operation, extreme smoothing is desirable, as already stated. Using narrow VBWs works well but using very long bucket durations and the average detector works best. Reducing the number of trace points makes the buckets longer.

For best operation, the power scale (Average Type = **Power**) is optimum. When making CW measurements in the presence of noise without NFE, averaging on the decibel scale has the advantage of reducing the effect of noise. When using NFE, the NFE does an even better job than using the log scale ever could. Using NFE with the log scale is not synergistic, though; NFE with the power scale works a little better than NFE with log averaging type.

The results from NFE with internal preamp can often be lower than the theoretical noise in a signal source at room temperature, a noise density of -174 dBm/Hz. This is expected and useful behavior, because NFE is designed to report the amount of input signal that is in excess of the thermal noise, not the amount that includes the thermal noise. This can be a useful behavior because thermal noise often interferes with what you want to measure, instead of being part of what you want to measure. Note that NFE is not adequately accurate to always be able to read below kTB.

Adaptive NFE provides an alternative to fully-on and fully-off NFE. Fully-on NFE can, notably in cases with little or no averaging of the spectrum, result in a display that is distractingly unfamiliar in the variability in response to low level signals. Fully-off NFE fails to achieve the potential improvement in dynamic range and associated accuracy of measurement of low-level signals. Adaptive NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement — those settings with high degrees of variance reduction through some variant of averaging. When the potential improvement is small, the display acts like the NFE-off case, and when it is high, it acts like the fully-on case, and in-between, application is a compromise between attractiveness and effectiveness.

On instruments with the NF2 license installed, the calibrated Noise Floor used by **Noise Floor Extension** should be refreshed periodically. Keysight recommends that the **Characterize Noise Floor** operation be performed after the first 500 hours of operation, *and* once every calendar year. The control to perform this is located in the **System, Alignments, Advanced** menu. If you have not done this yourself at the recommended interval, then when you turn on **Noise Floor Extension**, the instrument will prompt you to do so with a dialog that says:

“This action will take several minutes to perform. Please disconnect all cables from the RF input and press Enter to proceed. Press ESC to cancel, or Postpone to postpone for a week”

If you **Cancel**, you will be prompted again the next time you turn NFE on. If you postpone, you will be prompted again after a week passes and you then turn NFE on.

Enable Wideband IF for FFT

When `OFF`, the maximum FFT BW is limited to 40 MHz. When `ON`, FFT with more wideband IF is supported depending on the instrument. For example, the max FFT BW is 510 MHz with option B5X. When ON for R10/R20/R40, the max FFT BW is 1GHz.

When this parameter is on and the following conditions are met, the measurement is performed with a single I/Q acquisition.

- Stop Freq of the outermost Offset range is within the available IQ acquisition BW
- Same RBW, VBW, Detector Type settings across all Offset ranges and Carrier
- Sweep Type = FFT and Sweep Time = Auto across all Offset ranges and Carrier

Remote Command	`[:SENSe]:SEMask:WBFFt:ENABle ON | OFF | 1 | 0` `[:SENSe]:SEMask:WBFFt:ENABle?`
Example	`:SEM:WBFF:ENAB 1` `:SEM:WBFF:ENAB?`
Dependencies	The maximum FFT BW depends on the µW preselector and the current frequency. In hi-band, the µW preselector must be disabled to apply the FFT with wideband IF. Otherwise, the maximum FFT BW is limited to 40 MHz
Preset	`OFF`
State Saved	Saved in instrument state
Range	`ON|OFF`

3.5.23.8 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, "Global Center Freq" on page 2276) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to `ON`, it applies to all Modes that support Global settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched `ON`, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Frequency** remains unchanged.

Adjusting the **Center Frequency** of any Mode that supports Global Settings, while **Global Center Freq** is `ON`, modifies the **Global Center Freq**.

When **Global Center Freq** is switched `OFF`, the **Center Frequency** of the current Mode is unchanged, but now the **Center Frequency** of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is `ON`, the **Global Center Freq** is preset to the preset **Center Frequency** of the current Mode.

This function resets to `OFF` when "Restore Defaults" on page 2278 is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:FREQuency:CENTer ALL | NONE` `:INSTrument:COUPle:FREQuency:CENTer?`
Example	`:INST:COUP:FREQ:CENT ALL` `:INST:COUP:FREQ:CENT?`
Preset	Set to `OFF` on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	`ALL|NONE`

Preset	`OFF`
Backwards Compatibility SCPI	`:GLOBal:FREQuency:CENTer[:STATe] 1 | 0 | ON | OFF` `:GLOBal:FREQuency:CENTer[:STATe]?`

Global EMC Std

When this control is switched `ON`, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the **Global EMC Std**, so you can switch between any of these Modes and the EMC Std remains unchanged.

Adjusting the EMC Std of any Mode that supports Global settings, while **Global EMC Std** is `ON` modifies the **Global EMC Std**.

When **Global EMC Std** is switched `OFF`, the EMC Std of the current Mode remains unchanged, but now the EMC Std of each Mode is once again independent. When

Mode Preset is pressed while **Global EMC Std** is `ON`, **Global EMC Std** is preset to the preset EMC Std of the current Mode.

This function resets to `OFF` when "Restore Defaults" on page 2278 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:EMC:STANdard ALL | NONE` `:INSTrument:COUPle:EMC:STANdard?`
Example	`:INST:COUP:EMC:STAN ALL` `:INST:COUP:EMC:STAN?`
Dependencies	Only available if Option EMC is installed
Preset	Set to `OFF` on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	`ALL | NONE`

Extend Low Band

The software maintains a Mode Global value called **Extend Low Band**.

Under the current sweep configuration crossing over two bands, when **Extend Low Band** is turned `ON`, the instrument checks whether one band can cover the whole sweep frequency range or not. If it can, then the instrument locks the band; otherwise, it does nothing (the band crossover occurs).

This function does *not* work when **Band Lock** under **System** > **Service** > **Lock Functions** is not -1 (no Band Lock). In that case, **Band Lock** takes priority over **Extend Low Band**.

This function resets to `OFF` when "Restore Defaults" on page 2278 is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:FREQuency:BAND:EXTend 0 | 1 | ON | OFF` `:INSTrument:COUPle:FREQuency:BAND:EXTend?`
Example	`:INST:COUP:FREQ:BAND:EXT 1` `:INST:COUP:FREQ:BAND:EXT?`
Preset	Set to `OFF` by **Global** Settings > **Restore Defaults** and **System** > **Restore Defaults** > **All Modes**
Range	`ON|OFF`

Restore Defaults

Resets all functions in the **Global** settings menu to `OFF`. Pressing **System**, **Restore Defaults**, **All Modes** has the same effect.

Remote Command	`:INSTrument:COUPle:DEFault`

Example	`:INST:COUP:DEF`
Backwards Compatibility SCPI	`:GLOBal:DEFault`

3.5.24 Sweep

Accesses controls to configure and control the acquisition of data, and the X-axis parameters of the instrument.

Depending on the selected mode and measurement, these controls might include: **Sweep Time**, **Continuous/Single**, **Pause/Resume**, **X Scale** and **Number of Points**.

3.5.24.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See "More Information" on page 966

Remote Command	`:INITiate:CONTinuous OFF | ON | 0 | 1` `:INITiate:CONTinuous?`

Example	Put instrument into **Single** measurement operation:
	`:INIT:CONT 0`
	`:INIT:CONT OFF`
	Put instrument into **Continuous** measurement operation:
	`:INIT:CONT 1`
	`:INIT:CONT ON`

Preset	`ON` Note that `:SYST:PRES` sets `:INIT:CONT` to `ON`, but `*RST` sets `:INIT:CONT` to `OFF`
State Saved	Saved in instrument state
Annunciation	The **Single/Continuous** icon in the Meas Bar changes depending on the setting: – A line with an arrow is **Single** – A loop with an arrow is **Continuous**

Backwards Compatibility Notes	X-Series A-models had **Single** and **Cont** hardkeys in place of the **SweepSingleCont** softkey. In the X-Series A-models, if in single measurement, the **Cont** hardkey (and `INIT:CONT ON`) switched to continuous measurement, but never restarted a measurement and never reset a sweep X-Series B-models have a **Cont/Single** toggle control instead of **Single** and **Cont** hardkeys, but it is still true that, if in single measurement, the **Cont/Single** toggle control never restarts a measurement and never resets a sweep

More Information

Continuous Mode	The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the **Average/Hold Num**, the count stops incrementing, but the instrument keeps sweeping See the **Trace** key description under **Trace Average** for the averaging formula used both before and after the **Average/Hold Num** is reached. The trigger condition must be met prior to each sweep The type of trace processing for multiple sweeps is set under the **Trace** key, with choices of **Trace Average**, **Max Hold**, or **Min Hold**
Single Mode	The instrument takes a single sweep when in **Single** mode, or if in average or Max/Min Hold, or if there is a **Waterfall** window displayed, it takes multiple sweeps until the average/hold count reaches the **Average/Hold Num**, then the count stops incrementing, and the instrument stops sweeping See the **Trace** key description under **Trace Average** for the averaging formula used. The trigger condition must be met prior to the sweep The type of trace processing for multiple sweeps is set under the **Trace** key, with choices of **Trace Average**, **Max Hold**, or **Min Hold**

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

– `:INIT:CONT 1` has no effect

– `:INIT:CONT 0` places the instrument in Single Sweep but has no effect on the current sequence until k = N, at which point the current sequence will stop and the instrument will go to the idle state

See "Restart" on page 2279 for details of `:INIT:IMMediate`.

If the instrument is already in **Single** sweep, `:INIT:CONT OFF` has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending `:INIT:IMM` *does* reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending `:CALC:AVER:TCON UP`.

Restart

Restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending `:INIT:IMM`
- Sending `:INIT:REST`

See "More Information" on page 968

Remote Command	`:INITiate[:IMMediate]` `:INITiate:RESTart`
Example	`:INIT:IMM` `:INIT:REST`
Notes	`:INIT:REST` and `:INIT:IMM` perform exactly the same function
Couplings	Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The `STATus:OPERation` register bits 0 through 8 are cleared , *except* bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The `STATus:QUEStionable` register bit 9 (`INTegrity` sum) is cleared The `SWEEPING` bit is set The `MEASURING` bit is set
Backwards Compatibility Notes	For Spectrum Analysis Mode in ESA and PSA, the **Restart** hardkey and the `:INIT:REST` command restarted trace averages (displayed average count reset to 1) for a trace in **Clear Write**, but did not restart **Max Hold** and **Min Hold** In X-Series, the **Restart** hardkey and the `:INIT:REST` command restart not only **Trace Average**, but **MaxHold** and **MinHold** traces as well

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command `:CALC:AVER:TCON UP`.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

Event	Trace Effect
Clear/Write pressed (even if already in Clear/Write)	Set to mintracevalue
Max Hold pressed (even if already in Max Hold)	Set to mintracevalue
Min Hold pressed (even if already in Min Hold)	Set to maxtracevalue
Trace Average pressed (even if already in Trace Average)	Trace data unaffected but start new sweep/avg/hold
Restart pressed	Trace data unaffected but start new sweep/avg/hold
Parameter requiring restart changed (e.g., RBW)	Trace data unaffected but start new sweep/avg/hold

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is `k`. This `k` is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This `k` is used for comparisons with N, as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, `K`, shows the count for the sweep (data acquisition) in progress. `K` = `k` + 1, with a limit of N. The displayed value `K` changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** un-pauses the measurement. When paused, pressing **Restart** performs a Resume.

Remote Command	`:INITiate:PAUSe` `:INITiate:RESume`

Example	`:INIT:PAUS` `:INIT:RES`
Dependencies	Not displayed in Modes that do not support pausing
Annotation	Only on control

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORt` is sent, the alignment finishes *before* the abort function is performed, so `:ABORt` does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	`:ABORt`
Example	`:ABOR`
Notes	If :`INIT:CONT` is `ON`, then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met If :`INIT:CONT` is `OFF`, then `:INIT:IMM` is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met
Dependencies	For continuous measurement, `:ABORt` is equivalent to the **Restart** key Not all measurements support this command
Status Bits/OPC dependencies	The `STATus:OPERation` register bits 0 through 8 are cleared , *except* bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The `STATus:QUEStionable` register bit 9 (`INTegrity` sum) is cleared Since all the bits that feed into OPC are cleared by `:ABORt`, the Abort command will cause the `*OPC` query to return true

3.5.24.2 X Scale

Accesses controls that enable you to set the horizontal scale parameters.

Ref Value

Sets the X reference value.

Remote Command	`:DISPlay:SEMask:WINDow[1]:TRACe:X[:SCALe]:RLEVel <freq>` `:DISPlay:SEMask:WINDow[1]:TRACe:X[:SCALe]:RLEVel?`
Example	`:DISP:SEM:WIND:TRAC:X:RLEV 10` `:DISP:SEM:WIND:TRAC:X:RLEV?`
Couplings	If "Auto Scaling" on page 798 is `ON`, this value is automatically determined by the measurement result. If you set this value manually, **Auto Scaling** automatically changes to `OFF`
Preset	1.0 GHz
State Saved	Saved in instrument state
Min	-1000 GHz
Max	1000 GHz
Backwards Compatibility SCPI	`:DISPlay:SEMask:VIEW[1]:WINDow[1]:TRACe:X[:SCALe]:RLEVel`

Scale/Div

Sets the horizontal scale.

Remote Command	`:DISPlay:SEMask:WINDow[1]:TRACe:X[:SCALe]:PDIVision <freq>` `:DISPlay:SEMask:WINDow[1]:TRACe:X[:SCALe]:PDIVision?`
Example	`:DISP:SEM:WIND:TRAC:X:PDIV 500` `:DISP:SEM:WIND:TRAC:X:PDIV?`
Couplings	If **Auto Scaling** is `ON`, this value is automatically determined by the measurement result. When you set this value manually, **Auto Scaling** automatically changes to `OFF`
Preset	Automatically Calculated
State Saved	Yes Saved in instrument state
Min	1 Hz
Max	100 GHz
Backwards Compatibility SCPI	`:DISPlay:SEMask:VIEW[1]:WINDow[1]:TRACe:X[:SCALe]:PDIVision`

Ref Position

Sets the reference position for the X axis to Left, Center or Right.

Remote Command	`:DISPlay:SEMask:WINDow[1]:TRACe:X[:SCALe]:RPOSition LEFT | CENTer | RIGHt` `:DISPlay:SEMask:WINDow[1]:TRACe:X[:SCALe]:RPOSition?`
Example	`:DISP:SEM:WIND:TRAC:X:RPOS LEFT`

	`:DISP:SEM:WIND:TRAC:X:RPOS?`
Preset	`CENTer`
State Saved	Saved in instrument state
Range	Left|Center|Right
Backwards Compatibility SCPI	`:DISPlay:SEMask:VIEW[1]:WINDow[1]:TRACe:X[:SCALe]:RPOSition`

Auto Scaling

Toggles the scale coupling function On or Off.

Remote Command	`:DISPlay:SEMask:WINDow[1]:TRACe:X[:SCALe]:COUPle 0 | 1 | OFF | ON` `:DISPlay:SEMask:WINDow[1]:TRACe:X[:SCALe]:COUPle?`
Example	`:DISP:SEM:WIND:TRAC:X:COUP ON` `:DISP:SEM:WIND:TRAC:X:COUP?`
Couplings	When **Auto Scaling** is ON and the **Restart** front-panel key is pressed, this function automatically determines the scale per division and reference values based on the measurement results When you set a value to either "Scale/Div" on page 971 or "Ref Value" on page 970 manually, **Auto Scaling** automatically changes to `OFF`
Preset	`ON`
State Saved	Saved in instrument state
Range	`OFF|ON`
Backwards Compatibility SCPI	`:DISPlay:SEMask:VIEW[1]:WINDow[1]:TRACe:X[:SCALe]:COUPle`

3.5.24.3 Sweep Config

Accesses controls that enable you to configure the Sweep and Control functions of the instrument, such as Sweep Rules.

Points

Sets the number of points displayed in the traces. The current value of points is displayed in the bottom-right corner of the display.

Remote Command	`[:SENSe]:SEMask:SWEep:POINts <integer>` `[:SENSe]:SEMask:SWEep:POINts?`
Example	`:SEM:SWE:POIN 4001`

	`:SEM:SWE:POIN?`
Preset	2001
State Saved	Saved in instrument state
Min	201
Max	10001
Annotation	On second line of annotations in bottom right corner

IF Dithering

Lets you turn IF Dithering on or off. This is a technique used in unpreselected instruments (such as Keysight's modular instruments) to enhance the rejection of images and internally-generated spurious signals.

Remote Command	`[:SENSe]:SWEep:IF:DITHer OFF | ON | 0 | 1` `[:SENSe]:SWEep:IF:DITHer?`
Dependencies	Only appears in Spectrum Analyzer Mode in VXT models
Preset	`OFF`
State Saved	Saved in instrument state

Image Protection

Lets you turn IF Protection on or off. This is a technique used in unpreselected instruments (such as Keysight's modular instruments) to detect and suppress images and spurs that may be present in non-preselected hardware.

IF Protection takes two sweeps and by correlating the data between them, provides a single, correct power-versus-frequency trace.

Remote Command	`[:SENSe]:SWEep:IMAGeprot OFF | ON | 0 | 1` `[:SENSe]:SWEep:IMAGeprot?`
Dependencies	Only appears in Spectrum Analyzer Mode in VXT model M9421A
Preset	`ON`
State Saved	Saved in instrument state

3.5.25 Trace

Lets you control the acquisition, display, storage, detection and manipulation of trace data for the available traces. The Trace Control tab of this menu contains radio-button selections for the trace type (**Clear/Write, Trace Average, Max Hold, Min Hold**) and **View/Blank** setting for the selected trace.

3.5.25.1 Select Trace

Specifies the *selected trace*, which is the trace that will be affected when you change trace settings.

Select Trace appears above the menu panel, indicating that it applies to *all* controls in the menu panel. **Select Trace** is blanked if you select a tab whose controls do *not* depend on the selected trace (for example, **Trace Function**).

Notes	The selected trace is remembered even when not in the **Trace** menu
Dependencies	For the Swept SA measurement: – In Image Suppress mode, when you select a trace it becomes the active trace, and the formerly active trace goes into View – When you turn on Image Suppress, Update turns off for all traces except the selected trace For the ACP measurement, when **Meas Method** is `RBW`, `FAST` or `FPOWer`, **Select Trace** is disabled
Preset	Trace 1
State Saved	Yes

3.5.25.2 Trace Control

The controls on this tab allow you to set the "Trace Type" on page 2137 and its update mode.

There are four Trace Types:

- **Clear/Write**
- **Trace Average**
- **Max Hold**
- **Min Hold**

Each type handles data in a different way.

Each trace also has two values that determine whether it is being written or not, and whether it is being displayed or not. These values, **Update** and **Display,** are described fully in the "View/Blank" on page 2142 control description. Essentially, when **Update** is `ON`, a trace is updating, and when **Update** is `OFF` it is not. When **Display** is `ON`, it is visible and when **Display** is `OFF` it is not. These terms are used throughout the descriptions in this section.

Trace Type

There are four trace Types:

Option	Parameter	SCPI Example	Details
Clear/Write	`WRITe`	`:TRAC2:TYPE WRIT`	See: "Clear/Write" on page 978
Trace Average	`AVERage`	`:TRAC2:TYPE AVER`	See: "Trace Average" on page 978
Maximum Hold	`MAXHold`	`:TRAC3:TYPE MAXH`	See: "Max Hold" on page 979
Minimum Hold	`MINHold`	`:TRAC5:TYPE MINH`	See: "Min Hold" on page 979

Full descriptions of each type are provided below. You may select one of these types for each trace. Re-selecting the current **Trace Type** initiates the same action that selecting it the first time did, even though it is already selected. For example, selecting **Clear/Write** while **Clear/Write** is already selected will nonetheless clear the trace and begin rewriting it.

Besides the **Trace Type**, the "View/Blank" on page 2142 state must be set to **Active** (**Update**: `ON`, **Display**: `ON`) for a trace to be updating and visible. Selecting any **Trace Type** automatically makes the trace **Active**.

See also: "Trace Mode Backwards Compatibility Commands" on page 976

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe[1]|2|…|6:TYPE WRITe | AVERage | MAXHold | MINHold`
	`:TRACe[1]|2|…|6:TYPE?`
	For all other measurements:
	`:TRACe[1]|2|3:<meas>:TYPE WRITe | AVERage | MAXHold | MINHold`
	`:TRACe[1]|2|3:<meas>:TYPE?`
	where `<meas>` is the identifier for the current measurement

Example	`:TRAC:TYPE WRIT` `:TRAC:TYPE?`
Couplings	Selecting a **Trace Type** (by pressing any of the Trace Type selections or sending `:TRAC:TYPE`) sets the Trace to **Active** (**Update**: `ON`, **Display**: `OFF`), even if the same trace type was already selected When Detector setting is "Auto" (`[:SENSe]:<meas>:DETector:AUTO?`), Detector (`[:SENSe]:<meas>:DETector[:FUNCtion]?`) switches aligning with the switch of this parameter: "`NORMal`" with `WRITe` (Clear Write), "`AVERage`" with `AVERage`, "`POSitive` (peak)" with `MAXHold`, and "`NEGative` (peak)" with `MINHold`
Preset	Swept SA and Monitor Spectrum: `WRITe` All other measurements: `AVERage` Following **Preset**, all traces are cleared (all trace points set to mintracevalue)
State Saved	The type of each trace is saved in instrument state
Annunciation	The type for each trace is indicated in the Trace annunciator panel on the Measurement Bar

Trace Mode Backwards Compatibility Commands

In earlier instruments, the “Trace Modes” were: Clear/Write, Max Hold, Min Hold, View and Blank. Averaging was global to all traces and was controlled under the **BW/Avg** menu.

In X-Series, trace averaging can be done on a per-trace basis. The Trace Modes (now called Trace Types) are Clear/Write, Trace Average, Max Hold and Min Hold. View and Blank are set separately under "View/Blank" on page 2142.

While this provides more flexibility, it also gives rise to potential backwards compatibility problems. To mitigate these, the old Trace Mode command has been retained and a new Trace Type command has been added. The :`TRACe:MODE` command is retained for backwards compatibility, and the :`TRACe:TYPE`, :`TRACe:UPDate` and :`TRACe:DISPlay` commands introduced for ongoing use. The old Trace Modes are selected using `:TRAC:MODE`, whose parameters are mapped into calls to `:TRACe:TYPE`, `:TRACe:UPDate` and `:TRACe:DISPlay`, and the old global Averaging command `[:SENSe]:AVERage[:STATe]` is provided for backwards compatibility. See the individual command descriptions for details.

When **Average/Hold** in the **Meas Setup**, **Legacy Compatibility** menu is `ON`, the following is true for traces in Max Hold and Min Hold:

- They ignore the **Average/Hold** number; **Single** for Max Hold causes one sweep only, so switching to **Single** stops after the current sweep, and switching to **Cont** starts again without clearing the accumulated result
- Max Hold is not cleared on a **Restart**, **Single** or `:INIT:IMM`, but changing a measurement parameter, like frequency or bandwidth etc., still restarts the Max Hold

Preset	`WRITe`
State Saved	The trace mode is an alias only
Backwards Compatibility SCPI	`:TRACe[1]|2|…|6:MODE WRITe | MAXHold | MINHold | VIEW | BLANk` `:TRACe[1]|2|…|6:MODE?`
Backwards Compatibility Notes	The legacy `:TRACe:MODE` command is retained for backwards compatibility. In conjunction with the legacy `:AVErage` command, it works as follows: – `:AVErage ON|OFF` sets/clears a variable that we will call average for the sake of this discussion. This variable is maintained by the instrument solely for backwards compatibility. See the `[:SENSe]:AVERage[:STATe]` command description below – `:TRACe:MODE WRITe` sets `:TRACe:TYPE WRITe` (Clear/Write) unless average is true, in which case it sets it to `:TRACe:TYPE AVErage`. It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace – `:TRACe:MODE MAXHold` sets `:TRACe:TYPE MAXHold` (Max Hold). It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace

- `:TRACe:MODE MINHold` sets `:TRACe:TYPE MINHol`d (Min Hold). It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace
- `:TRACe:MODE VIEW` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay ON`, for the selected trace
- `:TRACe:MODE BLANk` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay OFF`, for the selected trace

The query returns the same value as `:TRACe:TYPE?`, meaning that if you set `:TRACe:MODE:VIEW` or `:TRACe:MODE:BLANk`, the query response will not be what you sent

`:TRACe[n]:MODE` was formerly used to set the type or "writing mode" of the trace. At that time, View and Blank were writing modes. The new `:TRACe:TYPE` command should be used in the future, but `:TRACe:MODE` is retained to provide backwards compatibility

In X-Series, unlike earlier instruments, Max Hold and Min Hold now obey the Average Number and counts up to a terminal value as Average always has

As the **Average/Hold Number** now affects **Min Hold** and **Max Hold**, the operations that restart Averaging (for example, the **Restart** key) now also restart **Min Hold** and **Max Hold**

As a result of these changes, legacy code that restarts averaging while retaining a running Max Hold will need to be rewritten, because the Max Hold will now restart when the Average does

Also, previous to X-Series:

- Pressing **Max Hold** while already in **Max Hold** (or doing so remotely) had no effect. Now it will clear the trace and restart the sweep and the Max Hold sequence
- Changing the vertical scale (Log/Lin or dB/div) of the display restarted **Max Hold** and **Min Hold**. This is no longer the case

Preset	`OFF`
State Saved	The state of Average is saved in Instrument State for ghosting purposes
Backwards Compatibility SCPI	`[:SENSe]:AVERage[:STATe] ON | OFF | 1 | 0` `[:SENSe]:AVERage[:STATe]?`
Backwards Compatibility Notes	Previous to X-Series, Averaging (also sometimes known as trace averaging) was global to all traces, that is, it was either on or off for all active traces. The legacy command `[:SENSe]:AVERage [:STATe] ON|OFF|1|0` was used to turn Averaging on or off In X-Series, Averaging is turned on or off on a per-trace basis, so it can be on for one trace and off for another For backwards compatibility, the old global Average State variable is retained solely as a legacy variable, turned on and off and queried by the legacy command `[:SENSe]:AVERage[:STATe] OFF|ON|0|1.` When Average is turned on, any trace in Clear/Write will get put into Average. While Average is on, any trace put into Clear/Write by the old `:TRAC:MODE` command will instead get put into Average. When Average is turned off, any trace in Average will get put into Clear/Write

Trace Type Details

Clear/Write

Each trace update replaces the old data in the trace with new data.

Pressing **Clear/Write** for the selected trace, or sending `:TRAC:TYPE WRIT` for the specified trace, sets the trace type to **Clear/Write** and clears the trace, even if you are already in **Clear/Write**. Then a new sweep is initiated. Trigger conditions must be met before the sweep actually starts, and if in **Single** the sweep won't start until **Restart** is pressed.

Pressing **Clear/Write** stops the current sweep and initiates a new one, so **Trace Average, Max Hold** and **Min Hold** data may be interrupted in mid-sweep when **Clear/Write** is pressed, and therefore may not accurately reflect the displayed count. Therefore, when **Clear/Write** is pressed for one trace, **Trace Average, Max Hold** and **Min Hold** must restart for all traces.

When in **Clear/Write**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), a new sweep is initiated but the trace is not cleared.

Trace Average

The instrument maintains and displays an average trace, which represents the cumulative average on a point-by-point basis of the new trace data and previous averaged trace data.

Pressing **Trace Average** (for the selected trace), or sending `:TRAC:TYPE AVER` (for the specified trace), sets the trace type to **Trace Average**, clears the trace, initiates a new sweep, and restarts the Average sequence.

Details of the count limiting behavior and the averaging calculations may be found under **Avg|Hold Number** and **Average Type** under **Meas Setup.**

When in **Trace Average**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like Center Frequency or Attenuation), the average restarts and a new sweep is initiated but the trace is not cleared.

Restarting the average means:

- The average/hold count k is set to 1, so that the next time the average trace is displayed it simply represents one trace of new data
- A new sweep is initiated

- Once the new sweep starts, the trace is overwritten with current trace data as the first trace of the new average

Remember that restarting averaging also restarts **Max Hold** and **Min Hold**, as there is only one count for Trace Average and Hold.

Max Hold

The instrument maintains and displays a max hold trace, which represents the maximum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under **Meas Setup.**

Pressing **Max Hold** for the selected trace, or sending `:TRAC:TYPE MAXH` for the specified trace, sets the Trace Type to **Max Hold,** clears the trace , initiates a new sweep, and restarts the hold sequence, even if you are already in **Max Hold**.

When in **Max Hold**, if a measurement-related instrument setting is changed(that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Max Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Max Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the max hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated.

Remember that restarting **Max Hold** also restarts averaging and **Min Hold**, as there is only one count for Trace Average and Hold.

Min Hold

The instrument maintains and displays a min hold trace, which represents the minimum data value on a point-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under the **Meas Setup** functions.

Pressing **Min Hold** for the selected trace, or sending `:TRAC:TYPE MINH` for the specified trace, sets the Trace Type to **Min Hold,** clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Min Hold**.

When in **Min Hold**, if a measurement-related instrument setting is changed(that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Min Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Min Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the min hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated

Remember that restarting **Min Hold** also restarts **Max Hold** and averaging, because there is only one count for Trace Average and Hold.

Clear and Write | Restart Averaging | Restart Max/Min Hold

Starts the trace writing, as though the "Trace Type" on page 2137 had just been selected. The effect is exactly the same as reselecting the current **Trace Type** again – the control is provided because it may not be obvious that reselecting the same selection from a radio button menu will take any action.

This control displays different labels, depending on the selected Trace Type:

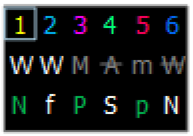
- **Clear/Write**: Clear and Write
- **Trace Average**: Restart Averaging
- **Max Hold**: Restart Max Hold
- **Min Hold**: Restart Min Hold

View/Blank

Lets you set the state of the two trace variables: **Update** and **Display**. The choices available in this dropdown menu are:

Active	Update and Display both ON
View	Update OFF; Display ON
Blank	Update OFF; Display OFF
Background	Update ON, Display OFF Allows a trace to be blanked *and* continue to update "in the background", which was not possible in the past

In the Swept SA measurement, a trace with **Display**OFF is indicated by a strikethrough of the type letter in the trace annotation panel in the Measurement Bar. A trace with **Update**OFF is indicated by dimming the type letter in the trace annotation panel in the Measurement Bar. In the example below, Traces 3, 4, 5 and 6 have **Update**OFF, and Traces 4 and 6 have **Display**OFF.



See: "More Information" on page 982

Notes	For the commands to control the two variables, Update and Display, see "Trace Update State On/Off" on page 981 and "Trace Display State On/Off" on page 981 below
Dependencies	When Signal ID is on, this key is grayed-out
Couplings	Selecting a Trace Type for a trace (pressing the key or sending the equivalent command) puts the trace in **Active** (Update `ON` and Display `ON`), even if that trace type was already selected Selecting a detector for a trace (pressing the key or sending `[:SENS]:DET:TRAC`) puts the trace in **Active** (**Update**`ON` and **Display**`ON`), even if that detector was already selected Selecting a "Math Function" on page 1145 other than `OFF` for a trace (pressing the key or sending the equivalent command) puts the trace in **Active** (**Update**`ON` and **Display**`ON`), even if that Math Mode was already selected Loading a trace from a file puts that trace in **View** regardless of the state it was in when it was saved; as does being the target of a **Copy** or a participant in an **Exchange**

Trace Update State On/Off

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe[1]|2|…|6:UPDate[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|…|6:UPDate[:STATe]?`
	For all other measurements:
	`:TRACe[1]|2|3:<meas>:UPDate[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|3:<meas>:UPDate[:STATe]?`
	where <meas> is the identifier for the current measurement

Example	Make trace 2 inactive (stop updating): `:TRAC2:UPD 0`
Couplings	Whenever you set **Update** to `ON` for any trace, the **Display** is set to `ON` for that trace

Preset	For Swept SA Measurement (in SA Mode):
	`1|0|0|0|0|0`
	`ON` for Trace 1; `OFF` for 2–6
	For all other measurements:
	`1|0|0`
	`ON` for Trace 1; `OFF` for 2 &3

State Saved	Saved in instrument state

Trace Display State On/Off

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe[1]|2|…|6:DISPlay[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|…|6:DISPlay[:STATe]?`
	For all other measurements:

	`:TRACe[1]|2|3:<meas>:DISPlay[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|3:<meas>:DISPlay[:STATe]?`
	where <meas> is the identifier for the current measurement

Example	Make trace 1 visible:
	`:TRAC2:DISP 1`
	Blank trace 3:
	`:TRAC3:DISP 3`

Couplings	Whenever you set **Update** to ON for any trace, the **Display** is set to ON for that trace

Preset	For Swept SA Measurement (in SA Mode):
	`1|0|0|0|0|0`
	ON for Trace 1; `OFF` for 2–6
	For all other measurements:
	`1|0|0`
	ON for Trace 1; `OFF` for 2 &3

State Saved	Saved in instrument state

More Information

When a trace becomes inactive, any update from the `:SENSe` system (detectors) immediately stops, without waiting for the end of the sweep. The trace data remains unchanged, but stops updating. If the trace is blanked, this still does not affect the data in the trace. Traces that are blanked (**Display**=`OFF`) do not display nor appear on printouts, but their data stays intact, they may be queried, and markers may be placed on them

In most cases, inactive traces are static and unchanging; however, there are cases when an inactive trace will update, specifically:

- if data is written to that trace from remote
- if trace data is loaded from mass storage
- if the trace is the target of a **Copy** or participant in an **Exchange**
- if the trace is cleared using **Clear Trace**

Inactive traces that are also being displayed (traces in **View**) are displayed at half intensity. Traces in **View** display across the entire X-Axis of the instrument. Their horizontal placement does not change, even if X-Axis settings subsequently are changed, although Y-Axis settings do affect the vertical placement of data.

When a trace becomes active (**Update**=ON), the trace is cleared, the average count is reset, and a new sweep is initiated.

Note that putting a trace into **Display**=`OFF` and/or **Update**=`OFF` does *not* restart the sweep and does *not* restart Averaging or Hold functions for any traces.

3.5.25.3 Math

Lets you turn on and configure Trace Math functions.

Math Function

Trace Math functions perform mathematical operations between traces and, in some cases, user-specified offsets. When in a Trace Math function, the indicated function is performed during the sweep with the math function used in place of a detector. The trace operands for the math function are set using the "Operand 1 / Operand 2" on page 1151 controls.

- See "How trace math is processed" on page 987

Remote Command	For option details, see "Trace Math Options" on page 985
	For Swept SA Measurement (in SA Mode):
	`:CALCulate:MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>`
	`:CALCulate:MATH? <trace_num>`
	where `<trace_num>` is any one of:
	`TRACE1|…|TRACE6`
	For all other measurements:
	`:CALCulate:<meas>:MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>`
	`:CALCulate[:<meas>]:MATH? <trace_num>`
	where:
	`<meas>` is the identifier for the current measurement, and
	`<trace_num>` is any one of:
	`TRACe1|TRACe2|TRACe3`
	Note that the format of the `TRACe<n>` parameter differs from that for the Swept SA Measurement

Example	`:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0`
	Sets Trace 3 to Power Diff trace math function, and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2
	`:CALC:MATH TRACE3,PSUM,TRACE1,TRACE2,0,0`
	Sets Trace 3 to Power Sum trace math function and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2
	`:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`

	Sets Trace 3 to Log Offset trace math function, sets the First Trace operand (for Trace 3) to Trace 1, leaves the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and sets the Log Offset (for Trace 3) to -6 dB
	`:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00`
	Sets Trace 3 to Log Diff trace math function, sets the First Trace operand (for Trace 3) to Trace 1, sets the Second Trace operand (for Trace 3) to Trace 2, and sets the Log Difference reference (for Trace 3) to -6 dBm
	`:CALC:MATH TRACE1,OFF,TRACE2,TRACE3,0,0`
	Turns off trace math for trace 1

Notes	The Trace Math Function command has 6 main set of parameters:
	- Set 1 defines the “result trace”:
	`TRACE1|…|TRACE6`
	-Set 2 defines the “function”:
	`PDIFference|PSUM|LOFFset|LDIFference|OFF`
	- Set 3 is a “trace operand” (1):
	`TRACE1|…|TRACE6`
	- Set 4 is a “trace operand” (2):
	`TRACE1|…|TRACE6`
	- Set 5 defines the “Log Offset” (in dB)
	- Set 6 defines the “Log Difference Reference” (in dBm)
	Note that the trace math mode is an enumeration; that is, when a math function is set for a trace, it turns off any math function that is on for that trace, then sets the new math function
	The parameters sent in the command are reflected in the values in the control menu. There is no default for any parameter; all 6 parameters must be sent to satisfy the parser. Failure to specify a parameter will result in a missing parameter message
	The query returns the math mode, the operand traces, the offset and the reference for the specified trace, all separated by commas

Dependencies	Trace Math is not available if **Normalize** is on Trace Math is not available if Signal ID is on None of the trace operands can be the destination trace. If any of the three trace math commands is sent with a destination trace number matching one of the operands, a warning is generated and the function does not turn on
Couplings	When a math function is changed for a trace, that trace is set to Display = `ON`; and Update = `ON`

Preset	For Swept SA Measurement (in SA Mode):
	`OFF,TRACE5,TRACE6,0,0 | OFF,TRACE6,TRACE1,0,0 | OFF,TRACE1,TRACE2,0,0 | OFF,TRACE2,TRACE3,0,0 | OFF,TRACE3,TRACE4,0,0 | OFF,TRACE4,TRACE5,0,0`
	For all other measurements:
	`OFF,TRACE2,TRACE3,0,0 | OFF,TRACE3,TRACE1,0,0 | OFF,TRACE1,TRACE2,0,0`

State Saved	The trace math function for each trace is saved in instrument state
Annunciation	An “f” is shown on the trace annunciation panel in the Measurement Bar when a math function is on;

	and the function is annotated on the trace if Trace Annotation is on
Status Bits/OPC dependencies	`*OPC` can be used to detect the completion of a sweep, which will also correspond to the completion of the math operation, since all math takes place during the sweep

Trace Math Options

IMPORTANT

To generate a trace math result, *you must take a sweep*. The trace math engine, described below, operates in concert with the sweep engine in the instrument. Until a sweep has been taken, even if the constituent traces are not in Update mode, no result is generated.

Note that certain events can affect the trace in ways that affects all points at once. This can happen in any number of ways, including:

- A trace clear taking place
- A trace being loaded from the file system
- Trace data being sent in from the remote interface
- A copy or exchange of trace data

You should try to avoid these occurrences during a sweep, as they will tend to invalidate the math result being accumulated.

The Trace Math functions are:

Power Diff (Op1 - Op2)

Calculates a power difference between the `First Trace` operand and the `Second Trace` operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace:

```
DestinationTrace = 10 log(10(1/10)(FirstTrace) – 10(1/10)(SecondTrace))
```

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in `FirstTrace` is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

Otherwise, if the result of the subtraction is less than or equal to 0, the resultant point is `mintracevalue`.

Power Sum (Op1 + Op2)

Calculates a power sum between the `First Trace` operand and the `Second Trace` operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

```
DestinationTrace = 10 log(10(1/10)(FirstTrace) + 10(1/10)(SecondTrace))
```

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in either trace operand is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

Log Offset (Op1 + Offset)

Calculates a log offset from the `First Trace` operand and puts the result in the destination trace. This is like the B-DL function in some older instruments. The offset is entered on the `Offset` control, which only appears when this math function is in force for the selected trace. Each destination trace has its own offset.

During the sweep, the following formula is executed for each point in the trace operand, and the corresponding point is generated for the destination trace.

```
DestinationTrace = FirstTrace + Offset
```

The values of the trace points are assumed to be in dBm (as they are internally stored) and the offset is in dB.

If a point in the trace operand is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

If a point in the trace operand is equal to `mintracevalue`, the resultant point is also `mintracevalue`.

Example: If offset is 25 dB, then our destination trace will be higher than the operand trace by 25 dB.

Note that the `Second Trace` operand is not used for this function.

Log Diff (Op1 - Op2 + Ref)

Offsets the difference between the `First Trace` operand and the `Second Trace` operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

Offsets the difference between the `First Trace` operand and the `Second Trace` operand by a reference and puts the result in the destination trace. This is like the A-

B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

```
DestinationTrace = (FirstTrace - SecondTrace) + Reference
```

The values of the operand trace points are assumed to be in decibel units (as they are internally stored) and the reference is in dBm so the result is in dBm.

Example: If the first operand trace 1 is at 5 dBm, the second operand trace 2 is at –5 dBm, and the reference is –25 dBm, then the destination trace will be –15 dBm.

Example: If the first operand trace1 is at 60 dBuV, the second operand trace 2 is at 50 dBuV, and the reference is 35 dBuV, then the destination trace will be 45 dBuV.

If a point in `FirstTrace` is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

If a point in `FirstTrace` is equal to `mintracevalue`, the resultant point is also `mintracevalue`.

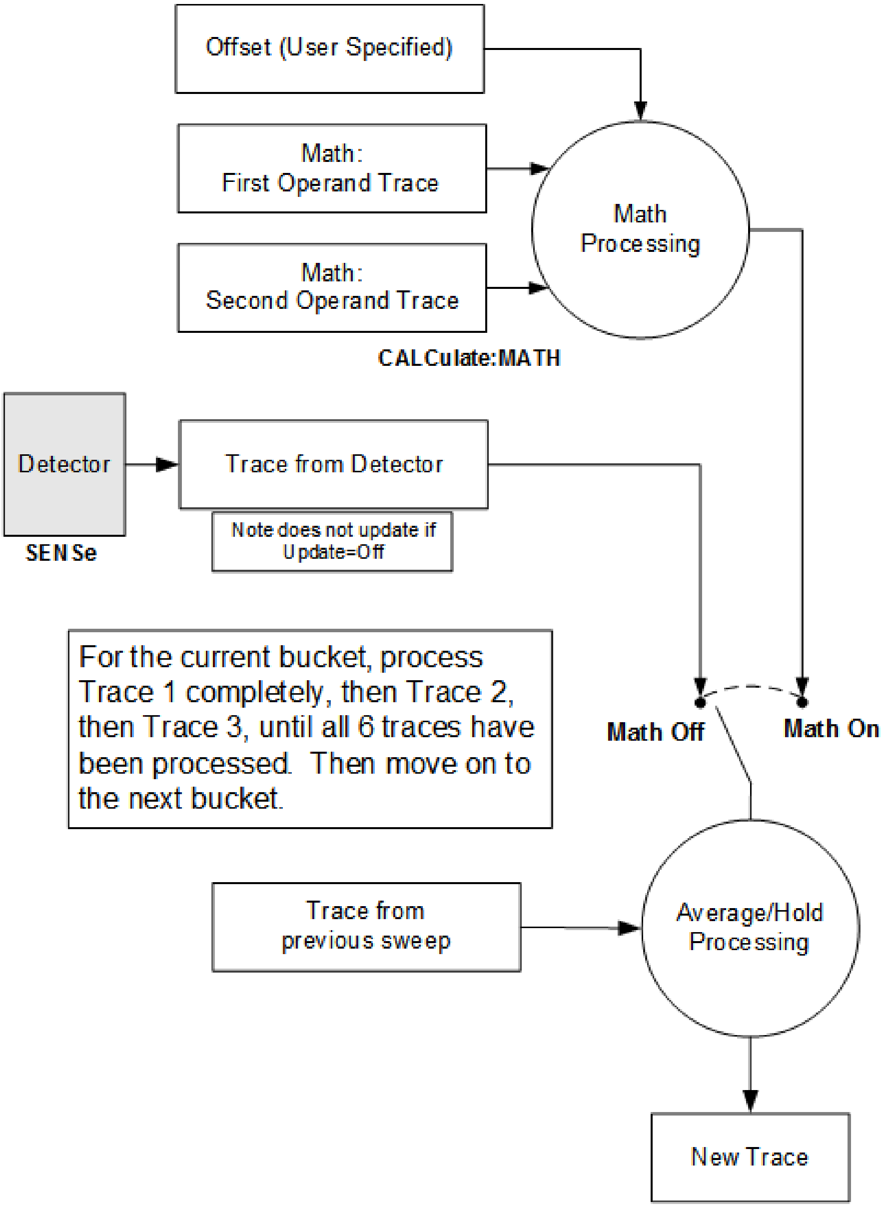
If neither of the above is true for a given point, then:

- If that point in `SecondTrace` is equal to `maxtracevalue`, the resultant point is `mintracevalue`.
- If that point in `SecondTrace` is equal to `mintracevalue`, the resultant point is `maxtracevalue`.

How trace math is processed

Whenever a trace math function is turned on, or the parameters and/or operands of an existing trace math function are changed, the destination trace is cleared. After the trace is cleared, all x-axis values in the trace, and the domain of the trace, are set to match the X-Axis settings of the first trace operand. When this is complete, a new sweep is initiated.

The process of acquiring data, processing it using the math and Average/Hold functions, and presenting it as trace data, consists of several functional blocks, as shown below:



For the current bucket, process Trace 1 completely, then Trace 2, then Trace 3, until all 6 traces have been processed. Then move on to the next bucket.

NOTE ABOUT OFFSETS: When either External Gain or Ref Level Offset is on, an offset is applied to the trace operands, and when Trace Math is on this offset is applied before any math processing is performed. Since the operands have already been offset the result trace should NOT be offset. Therefore when any Trace Math operation is performed, the sum of (External Gain - Ref Level Offset) is added to the result before it is stored in the result trace.

For each active trace, the current trace point is processed for `Trace 1`, then `Trace 2`, then `Trace 3`, etc. Trace data is taken from either the detector for that trace, or

from the mathematical result of up to two other traces and an offset, depending on whether trace math is on or not. The resultant data is then fed to the Average/Hold processing block, where (if the trace type is **Average**, **Max Hold**, or **Min Hold**) it is processed with previous trace data. The new trace data resulting from this process is then available for display, storage or remote output.

When the processing is complete for `Trace 1`, `Trace 2` is processed, and so on until all six traces have been processed. This allows a downstream trace to use as one of its math components a fully processed upstream trace. In other words, if math is `ON` for `Trace 4`, and its operand traces are `Trace 2` and `Trace 3`, then all detector, math, average and hold processing for Traces 2 and 3 is completed before the math is performed for `Trace 4`. When the current trace point is completed for all traces, the instrument moves on to the next trace point.

This allows very flexible and powerful math functions to be configured. For example, `Trace 1` can be an average trace, which can be fed with an offset to `Trace 2`, which can also be in **Max Hold**, allowing you to obtain the **Max Hold** of an Average trace.

Note that none of this processing is performed on inactive traces.

Note also that for any active trace with math `ON`, the Operand traces should have *lower* numbers than the trace (for example, using `Trace 4` as an operand for `Trace 1` will cause the data coming from `Trace 4` to be delayed by one sweep).

Operand 1 / Operand 2

These two controls select the first and second trace operands to be used for the trace math functions for the destination trace. The operands are common to all math functions for a given trace. The most recently sent `:CALCulate:MATH` command for a given trace sets the operands for that trace. Those settings are displayed on the trace operand controls for that trace.

Example	The following examples are for the Swept SA measurement
	Set Trace 3 to Power Diff trace math function. Set the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2:
	`:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0`
	Set Trace 3 to Log Offset trace math function. Set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB:
	`:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`

Notes	See "Math Function" on page 1145 for how to specify Operands 1 and 2 using `:CALCulate:MATH`
Dependencies	The destination trace cannot be an operand. The destination trace number is grayed-out on the dropdown
Preset	Operand 1: Trace number minus 2 (wraps at 1). For example, for Trace 1, Operand 1 presets to Trace

	5; for Trace 6, it presets to Trace 4 Operand 2: Trace number minus 1 (wraps at 1). For example, for Trace 1, Operand 2 presets to Trace 6; for Trace 6, it presets to Trace 5
State Saved	Operands 1 and 2 for each trace are stored in instrument state

Offset

Used by the Log Offset math function.

Example	The following example is for the Swept SA measurement Set Trace 3 to Log Offset trace math function, set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB: `:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`
State Saved	The Log Offset value for each trace is saved in Instrument State
Min	–100 dB
Max	100 dB

Reference

Used by the Log Diff math function.

Example	The following example is for the Swept SA measurement Set Trace 3 to Log Diff trace math function, set the First Trace operand (for Trace 3) to Trace 1, set the Second Trace operand (for Trace 3) to Trace 2, and set the Log Difference reference (for Trace 3) to -6 dBm: `:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00`
State Saved	The Log Difference reference value for each trace is saved in instrument state
Min/Max	Same as reference level

3.5.25.4 Trace Function

Contains controls to:

- Copy and Exchange traces
- Preset or Clear all traces

From Trace

Selects the trace to be copied to or exchanged with the "To Trace" on page 1153 when a "Copy" on page 1153 or "Exchange" on page 1154 is performed

Preset	1

To Trace

Selects the trace to be copied from or exchanged with the "From Trace" on page 1153 when a "Copy" on page 1153 or "Exchange" on page 1154 is performed

Preset	2

Copy

Executes a Trace Copy based on the "From Trace" on page 1153 and "To Trace" on page 1153 parameters. The copy operation is from the **From Trace** to the **To Trace**. The action is performed once.

The X-Axis settings and domain of a trace are also copied.

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe:COPY TRACE1 | … | TRACE6, TRACE1 | … | TRACE6`
	For all other measurements:
	`:TRACe:<meas>:COPY TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
	where `<meas>` is the identifier for the current measurement
	Note that the format of the `TRACe<n>` parameter differs from that for the Swept SA Measurement

Example	Copy Trace 1 to Trace 3 and put Trace 3 in Update=Off, Display=On `:TRAC:COPY TRACE1,TRACE3`
Notes	The command is of the form: `:TRACe:COPY <source_trace>,<dest_trace>`
Dependencies	When Signal ID is on, this key is grayed-out
Couplings	The destination trace is put in **View** (Update = Off, Display = On) after the copy

Preset	For Swept SA Measurement (in SA Mode):
	`TRACE1, TRACE2`
	For all other measurements:
	`TRACe1, TRACe2`

Exchange

Executes a Trace Exchange based on the "From Trace" on page 1153 and "To Trace" on page 1153 parameters. The **From Trace** and **To Trace** values are exchanged with each other. The action is performed once.

The X-Axis settings and domain of a trace are also copied when it is exchanged with another trace.

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe:EXCHange TRACE1 | … | TRACE6, TRACE1 | … | TRACE6`
	For all other measurements:
	`:TRACe:<meas>:EXCHange TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
	where `<meas>` is the identifier for the current measurement
	Note that the format of the `:TRACe<n>` parameter differs from that for the Swept SA Measurement

Example	Exchange Trace 1 and Trace 2 and put both traces in Update=`OFF`, Display=`ON`: `:TRAC:EXCH TRACE1,TRACE2`
Notes	The command is of the form: `:TRACe:EXCHange <trace_1>,<trace_2>`
Couplings	Both traces are put in **View** (Update=Off, Display=On) after the exchange

Preset All Traces

Turns on Trace 1 and blanks all other traces. This is useful when you have many traces on and you want to return to having only Trace 1 on the display. Does not affect the trace type, detector or any other aspect of the trace system.

Remote Command	`:TRACe[:<meas>]:PRESet:ALL`
Example	`:TRAC:PRES:ALL`
Dependencies	When Signal ID is on, this key is grayed-out

Clear All Traces

Clears all traces. Does not affect the state of any function or variable in the instrument. Loads `mintracevalue` into all of the points for all traces, except traces in **Min Hold**, in which case it loads `maxtracevalue`, even if **Update** = `OFF`.

Remote Command	`:TRACe[:<meas>]:CLEar:ALL`
Example	`:TRAC:CLE:ALL`
Dependencies	When Signal ID is on, this key is grayed-out

3.5.25.5 Advanced

Contains controls for setting advanced trace functions of the instrument.

Measure Trace

Specifies which trace’s scalar results are displayed in the **Metrics** window, and retrieved by sending a `:READ` or `:FETCh` query:

- Trace 1
- Trace 2
- Trace 3

Remote Command	`:CALCulate:<meas>:MTRace TRACe1 | TRACe2 | TRACe3`
	`:CALCulate:<meas>:MTRace?`
	`<meas>` is the identifier for the current measurement; any one of `CHPower | ACPower | OBWidth | SEMask | SPURious | PVTime`

Example	Channel Power
	`:CALC:CHP:MTR TRAC1`
	`:CALC:CHP:MTR?`

Dependencies	In the ACP measurement, this control is grayed-out when **Meas Method** is set to `RBW` or `FAST`, and only Trace 1 is enabled
Preset	`TRACe1`
State Saved	No
Range	Trace 1 | Trace 2 | Trace 3

3.6 Spurious Emissions Measurement

The Spurious Emissions measurement identifies and determines the power level of spurious emissions in certain frequency bands.

Measurement Commands

The general functionality of "CONFigure" on page 2997, "INITiate" on page 2998, "FETCh" on page 2998, "MEASure" on page 3000, and "READ" on page 2999 are described in the section **SCPI Operation and Results Query** in the topic **Programming the Instrument**.

Note that, in general, `:CONF:<Measurement>` resets the specified measurement settings to their defaults. X-Series permits the addition of the `NDEFault` node to the command, which prevents a measurement preset after a measurement switch.

The tables below list measurement commands for this measurement.

Command	Function
`:INITiate:SPURious`	Initiates a trigger cycle for the `SPUR` measurement, but does not return any data. You must then use `:FETC:SPUR[n]?` to retrieve data Does not change any measurement settings
`:CONFigure?`	Returns the long form name of current measurement, in this case, `SPURious`
`:CONFigure:SPURious`	Selects `SPUR` measurement with Meas Setup settings in preset state – same as "Meas Preset" on page 1096
`:CONFigure:SPURious:NDEFault`	Selects `SPUR` measurement *without* affecting settings

The following queries are used to retrieve data. The type of data returned depends on the value of `n`.

Command	Function
`:FETCh:SPURious[n]?`	Retrieves the data defined by n
`:MEASure:SPURious[n]?`	Switches to `SPUR` measurement, restores default values, starts the measurement, then retrieves the data defined by `n`
`:READ:SPURious[n]?`	Starts the measurement, then retrieves the data defined by n

Remote Command Results

The following table describes the results returned by the `:FETCh`, `:MEASure`, and `:READ` queries listed above, according to the index value `n`. Note that these queries are *not* available when viewing the Range Table.

The value of the constant `SCPI_NAN`, mentioned below, is 9.91E37.

n	Return Value
1 or omitted	Returns a variable-length (1 + 6 * Spurs – up to 1201 entries) comma-separated list containing detailed information in the following format: Number of spurs in following list (Integer) *[Repeat the following for each spur]* – Spur # – Range # Spur was located (Integer) – Frequency of Spur (Hz, Float64) – Amplitude of Spur (dBm, Float32) – Absolute Limit (dBm, Float32) – Pass or Fail (1|0, Boolean)
2 – 21 (Average Trace)	Regardless of the Trace selection, returns a comma-separated list of the average trace data for the selected range (where range number = `n` – 1) using Detector 1. If selected range is not active, `SCPI_NAN` is returned for each trace data element
22	Returns the number of spurs found for the selected Measured Trace
23 – 42 (Average Trace)	Regardless of the Trace selection, returns a comma-separated list of the average trace data for the selected range (where range number = `n` – 22) using Detector 2. If selected range is not active or Detector 2 selection is off, `SCPI_NAN` is returned for each trace data element
43 – 62 (Maximum Hold Trace)	Regardless of the Trace selection, returns a comma-separated list of the maximum hold trace data for the selected range (where range number = `n` – 42) using Detector 1. If selected range is not active, `SCPI_NAN` is returned for each trace data element
63 – 82 (Minimum Hold Trace)	Regardless of the Trace selection, returns a comma-separated list of the minimum hold trace data for the selected range (where range number = `n` – 62) using Detector 1. If selected range is not active, `SCPI_NAN` is returned for each trace data element
83-102	Reserved
103-122	Reserved
123-142 (Clear/Write Trace)	Regardless of the Trace selection, returns a comma-separated list of the clear/write trace data for the selected range (where range number = `n` – 122) using Detector 1. If selected range is not active, `SCPI_NAN` is returned for each trace data element
143-162 (Clear/Write Trace)	Regardless of the Trace selection, returns a comma-separated list of the clear/write trace data for the selected range (where range number = `n` – 142) using Detector 2. If selected range is not active or Detector 2 selection is off, `SCPI_NAN` is returned for each trace data element
163-182 (Trace 1)	Returns a comma-separated list of the trace data of Trace 1 for the selected range (where range number = `n` – 162). If selected range is not active, `SCPI_NAN` is returned for each trace data element
183-202 (Trace 2)	Returns a comma-separated list of the trace data of Trace 2 for the selected range (where range number = `n` – 182). If selected range is not active, `SCPI_NAN` is returned for each trace data element
203-222 (Trace 3)	Returns a comma-separated list of the trace data of Trace 3 for the selected range (where range number = `n` – 202). If selected range is not active, `SCPI_NAN` is returned for each trace data element
223	Returns "Marker Table" on page 1000 data as a series of comma separated values in the following form:

n	Return Value
	`<Marker Number>,<Marker Trace>,<X>,<Y>,<Reserved>,<Reserved>` Only markers that are enabled are included. `<Reserved>` items are returned as `SCPI_NAN` The data is returned in the current sort order as displayed in the **Marker Table**

3.6.1 Views

This measurement has two predefined views:

#	Name	SCPI
1	"Graph + Metrics" on page 1046	`RESult`
2	"All Ranges" on page 1046	`ALL`

These are multiple-window views. When in a multiple-window view, you select a window by touching it. The menu controls may sometimes change, depending on which window is selected.

Remote Command	`:DISPlay:SPURious:VIEW[:SELect] RESult | ALL` `:DISPlay:SPURious:VIEW[:SELect]?`
Example	`:DISP:SPUR:VIEW RANG` `:DISP:SPUR:VIEW?`
Preset	`RESult`
State Saved	No
Range	Graph + Metrics | All Ranges

3.6.1.1 Graph + Metrics

Windows: "Graph" on page 997,"Table" on page 998

Select Graph + Metrics to view measurement results.

- The upper window displays a trace of the range that contains the currently selected spur
- The lower window displays a list of spurs detected in a measurement cycle. The currently selected spur, which is highlighted, can be changed by the Spur control in the Meas Setup menu

Example	`:DISP:SPUR:VIEW RES`

3.6.1.2 All Ranges

Windows: "Graph" on page 997,

Select All Ranges to view measurement results for all the ranges.

- The upper window displays a merged trace of all the ranges
- The lower window displays a list of spurs detected in a measurement cycle. The currently selected spur, which is highlighted, can be changed by the Spur control in the Meas Setup menu

Example	`:DISP:SPUR:VIEW ALL`

3.6.2 Windows

The following windows are available in this measurement:

1. "Graph" on page 997
2. "Table" on page 998
3. "All Range Table" on page 999
4. "Gate" on page 1000
5. "Marker Table" on page 1000

The **Gate** Window is available only when "Gate View On/Off" on page 2915 is `ON` in **Gate Settings** under **Trigger**.

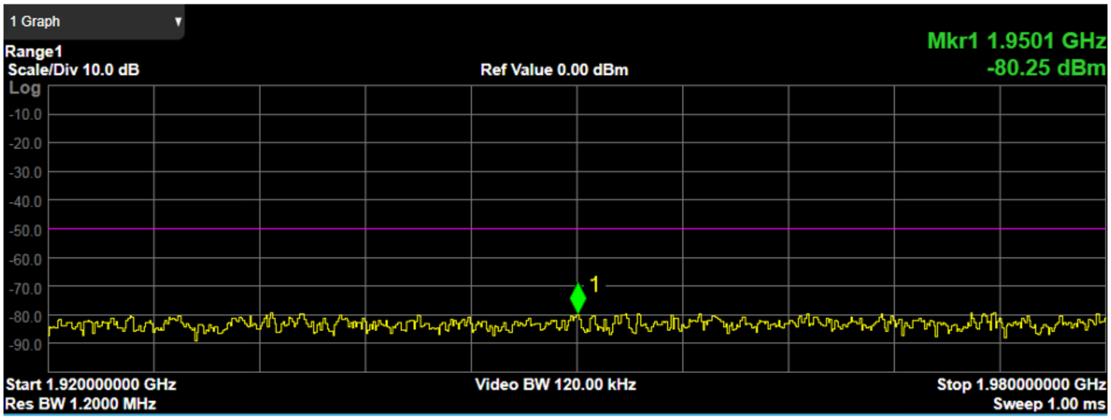
3.6.2.1 Graph

Window #1 & #3

Appears in several Views, as follows:

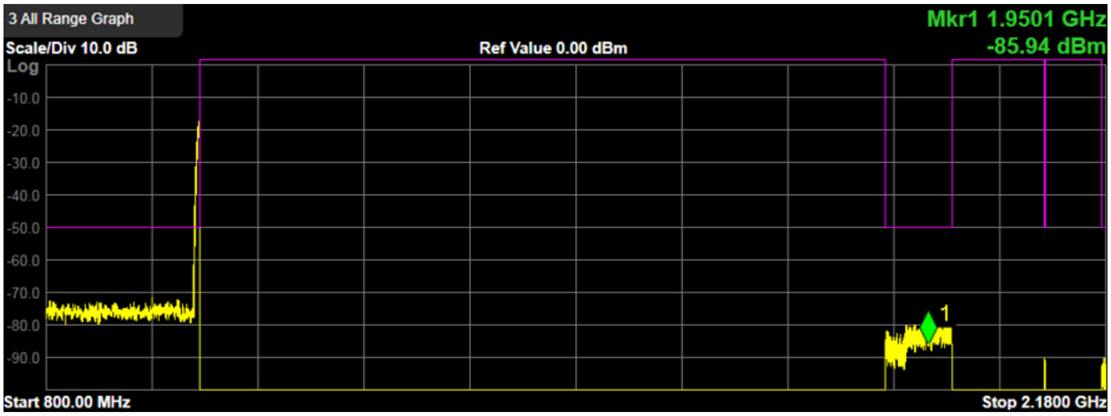
View	Size	Position
Graph + Metrics	Three fifth, full width	Top
All Ranges	Three fifth, full width	Top
Gate View	One third, full width	Middle

When Graph + Metrics is selected



Mkr1 1.9501 GHz
-80.25 dBm
Scale/Div 10.0 dB
Ref Value 0.00 dBm
Start 1.920000000 GHz
Res BW 1.2000 MHz
Video BW 120.00 kHz
Stop 1.980000000 GHz
Sweep 1.00 ms

When All Ranges is selected



Mkr1 1.9501 GHz
-85.94 dBm
Scale/Div 10.0 dB
Ref Value 0.00 dBm
Start 800.00 MHz
Stop 2.1800 GHz

3.6.2.2 Table

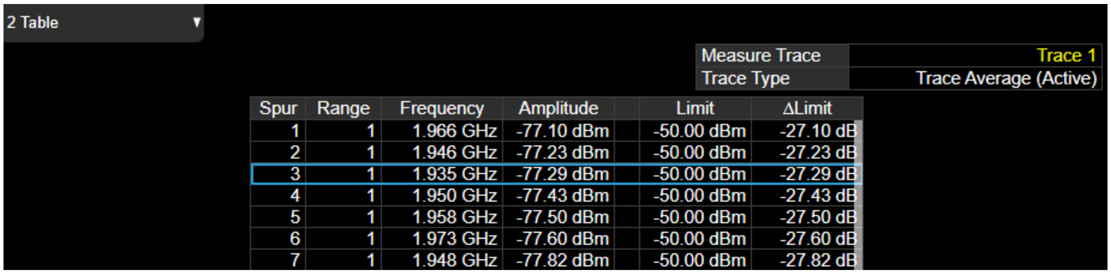
Window #2

The spurs listed are within the current value of the Marker Peak Excursion setting of the absolute limit. All the spurs listed passed. Any spur that has failed the absolute limit has an ‘F’ beside it.

Result	Units	Min	Max
Spur	N/A	0	200
Range	N/A	1	20
Frequency	Hz	Analyzer Min	Analyzer Max
Amplitude	dBm	Analyzer Min	Analyzer Max
Limit	dBm	-200	50
Δ Limit	dBm	(Limit - Amplitude)	

Views in which the **Table** window appears:

View	Size	Position
Graph + Metrics	Two fifth, full width	Bottom
Gate View	One third, full width	Bottom



Measure Trace	Trace 1
Trace Type	Trace Average (Active)

Spur	Range	Frequency	Amplitude	Limit	ΔLimit
1	1	1.966 GHz	-77.10 dBm	-50.00 dBm	-27.10 dB
2	1	1.946 GHz	-77.23 dBm	-50.00 dBm	-27.23 dB
3	1	1.935 GHz	-77.29 dBm	-50.00 dBm	-27.29 dB
4	1	1.950 GHz	-77.43 dBm	-50.00 dBm	-27.43 dB
5	1	1.958 GHz	-77.50 dBm	-50.00 dBm	-27.50 dB
6	1	1.973 GHz	-77.60 dBm	-50.00 dBm	-27.60 dB
7	1	1.948 GHz	-77.82 dBm	-50.00 dBm	-27.82 dB

Measure Trace

See "Measure Trace" on page 1155.

Trace Type

This is the trace type (and view/blank parameter) of a trace specified by Measure Trace.

3.6.2.3 All Range Table

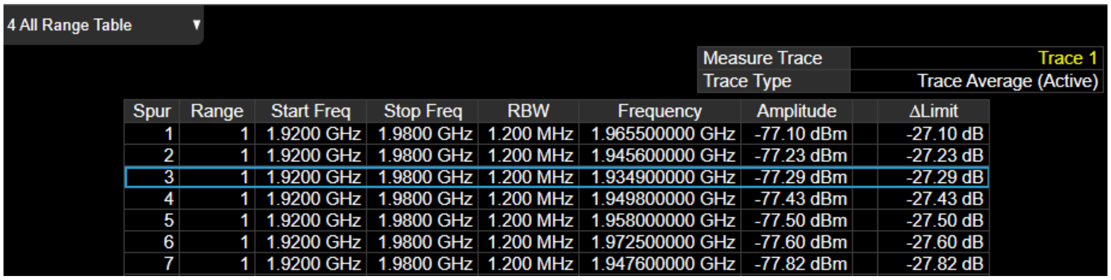
Window #4

The spurs listed are within the current value of the Marker Peak Excursion setting of the absolute limit. All the spurs listed passed. Any spur that has failed the absolute limit displays ‘F’ beside it.

Result	Units	Min	Max
Spur	N/A	0	200
Range	N/A	1	20
Start Freq	See "Start Freq" on page 1068 under Meas Setup		
Stop Freq	See "Stop Freq" on page 1069 under Meas Setup		
RBW	See "Res BW" on page 1070 under Meas Setup		
Frequency	Hz	Analyzer Min	Analyzer Max
Amplitude	dBm	Analyzer Min	Analyzer Max
Limit	dBm	-200	50
Δ Limit	dBm	(Limit - Amplitude)	

Views in which the **All Range Table** window appears:

View	Size	Position
All Ranges	Two fifth, full width	Bottom
Gate View	One third, full width	Bottom



Measure Trace	Trace 1
Trace Type	Trace Average (Active)

Spur	Range	Start Freq	Stop Freq	RBW	Frequency	Amplitude	ΔLimit
1	1	1.9200 GHz	1.9800 GHz	1.200 MHz	1.965500000 GHz	-77.10 dBm	-27.10 dB
2	1	1.9200 GHz	1.9800 GHz	1.200 MHz	1.945600000 GHz	-77.23 dBm	-27.23 dB
3	1	1.9200 GHz	1.9800 GHz	1.200 MHz	1.934900000 GHz	-77.29 dBm	-27.29 dB
4	1	1.9200 GHz	1.9800 GHz	1.200 MHz	1.949800000 GHz	-77.43 dBm	-27.43 dB
5	1	1.9200 GHz	1.9800 GHz	1.200 MHz	1.958000000 GHz	-77.50 dBm	-27.50 dB
6	1	1.9200 GHz	1.9800 GHz	1.200 MHz	1.972500000 GHz	-77.60 dBm	-27.60 dB
7	1	1.9200 GHz	1.9800 GHz	1.200 MHz	1.947600000 GHz	-77.82 dBm	-27.82 dB

3.6.2.4 Gate

Window #5

Turning on "Gate View On/Off" on page 2915 displays the **Gate** Window, which allows you to see your gating signal at the same time as the measured data.

Views in which the **Gate** window appears:

View	Size	Position
Gate View	One third, full width	Top

3.6.2.5 Marker Table

Window# 6

Displays a table containing detailed information about all the markers in the current measurement. It can be selected from the Data control on the Window Title. There is no specific view in which the **Marker Table** window turns on, it is on by demand.

3.6.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.6.3.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The reference line is at the top, center, or bottom of the graticule, depending on the value of the Ref Position function.

Remote Command	`:DISPlay:SPURious:WINDow[1]:TRACe:Y[:SCALe]:RLEVel <real>` `:DISPlay:SPURious:WINDow[1]:TRACe:Y[:SCALe]:RLEVel?`
Example	`:DISP:SPUR:WIND:TRAC:Y:RLEV 10 dBm` `:DISP:SPUR:WIND:TRAC:Y:RLEV?`
Couplings	When "Auto Scaling" on page 1002 is ON (default), this value is automatically determined by the measurement result. When you set a value manually, **Auto Scaling** changes to `OFF` Attenuation is not coupled to "Ref Value" on page 1001
Preset	10.00 dBm
State Saved	Saved in instrument state
Min/Max	–/+250.00 dBm
Annotation	Ref <value> top left of graph
Backwards Compatibility SCPI	`[:SENSe]:SPURious:POWer[:RF]:LEVel` `:DISPlay:SPURious:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RLEVel`

Scale/Div

For measurements that support a logarithmic Y-Axis, **Scale/Div** sets the height of one division of the graticule in the current Y-Axis unit.

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule division on the display, the total amplitude range of the graph is typically 10x this amount. For example, if Scale/Div is 10 dB, then the total range of the graph is 100 dB.

Remote Command	`:DISPlay:SPURious:WINDow[1]:TRACe:Y[:SCALe]:PDIVision <rel_ampl>` `:DISPlay:SPURious:WINDow[1]:TRACe:Y[:SCALe]:PDIVision?`
Example	`:DISP:SPUR:WIND:TRAC:Y:PDIV 10 dB` `:DISP:SPUR:WIND:TRAC:Y:PDIV?`
Couplings	Coupled to "Scale Range" on page 1002 as follows **Scale/Div** = **Scale Range**/10 (number of divisions) When **"Auto Scaling" on page 1002** is ON, this value is automatically determined by the measurement result When you change a value, **Auto Scaling** automatically changes to `OFF`

Preset	Automatically calculated
State Saved	Saved in instrument state
Min	0.10 dB
Max	20 dB
Annotation	<value> dB/ left upper of graph
Backwards Compatibility SCPI	`:DISPlay:SPURious:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PDIVision`

Scale Range

Sets the Y-Axis scale range.

Remote Command	Replace `<meas>` with the identifier for the current measurement
	`:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe <rel_ampl>`
	`:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe?`

Example	`:DISP:CHP:WIND:TRAC:Y:RANG 100` `:DISP:CHP:WIND:TRAC:Y:RANG?`
Couplings	Coupled to **Scale/Div** as follows **Scale Range** = **Scale/Div** * 10 (number of divisions) When you change this value, **Auto Scaling** automatically changes to `OFF`
Preset	100 dB
State Saved	Saved in instrument state
Min	1
Max	200

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change the reference level value.

Preset	`TOP`
State Saved	Saved in instrument state
Range	Top | Center | Bottom
Annotation	The greater than (>) and less than (<) symbols are displayed on both sides of the graph to indicate the Reference Position

Auto Scaling

Toggles **Auto Scaling** On or Off.

Remote Command	`:DISPlay:SPURious:WINDow[1]:TRACe:Y[:SCALe]:COUPle 0 | 1 | OFF | ON` `:DISPlay:SPURious:WINDow[1]:TRACe:Y[:SCALe]:COUPle?`
Example	`:DISP:SPUR:WIND:TRAC:Y:COUP OFF` `:DISP:SPUR:WIND:TRAC:Y:COUP?`
Couplings	When **Auto Scaling** is `ON`, and the **Restart** front-panel key is pressed, this function automatically sets the scale per division to 10 dB and determines the reference values based on the measurement results When you change the value of **"Scale/Div" on page 1001**, **"Ref Value" on page 1001** or "Scale Range" on page 1002, **Auto Scaling** automatically changes to `OFF` When **Auto Scaling** is `OFF`, the measurement uses the current reference level settings When **Auto Scaling** is `ON`, the instrument automatically sets the reference level such that the absolute limit is positioned two divisions down from the top of the display. This is the most useful setting when searching for spurs. The algorithm used for determining the ref level is Ref Level = Absolute Limit + (2 * Scale/Div). All other reference level settings are left as the current base instrument settings
Preset	1
State Saved	Saved in instrument state
Range	`OFF|ON`
Backwards Compatibility SCPI	`[:SENSe]:SPURious:POWer[:RF]:RANGe:AUTO` `:DISPlay:SPURious:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:COUPle`

3.6.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See "Dual-Attenuator Configurations" on page 1004
- See "Single-Attenuator Configuration" on page 1004

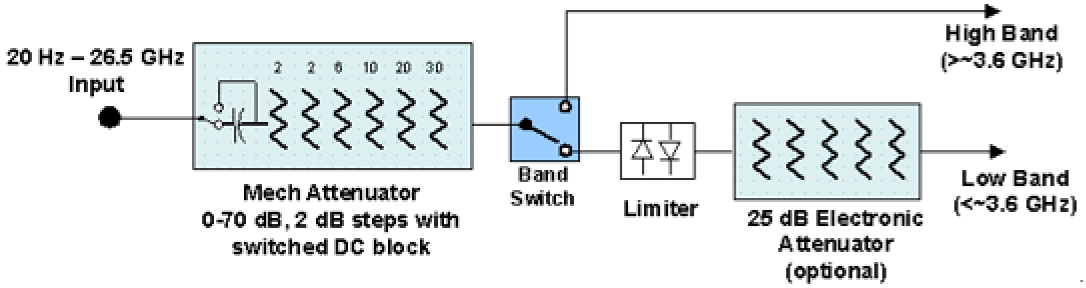
Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9420A/10A/11A/15A/16A, M9410E/11E/15E/16E, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

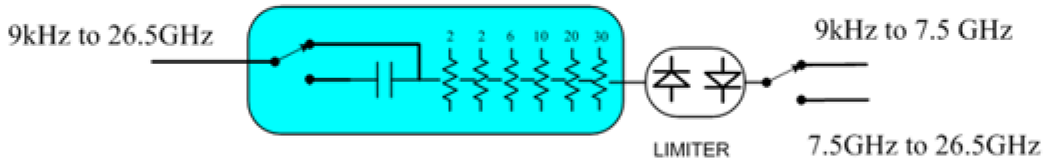
Dependencies	In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the **Range** tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

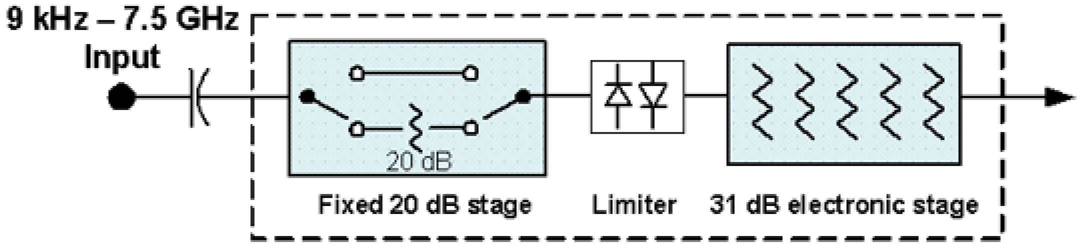


Configuration 2: Mechanical attenuator, no optional electronic attenuator

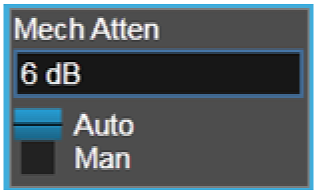


Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

Single-Attenuator Configuration

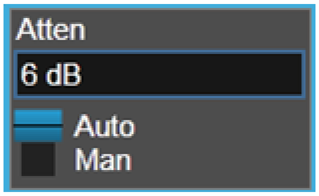


You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.



Mech Atten
6 dB

Dual Attenuator



Atten
6 dB

Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	`[:SENSe]:POWer[:RF]:FRATten <rel_ampl>` `[:SENSe]:POWer[:RF]:FRATten?`
Example	`:POW:FRAT 14` `:POW:FRAT?`
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See **Reference Level** and "Mech Atten" on page 2161 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	When the **Input** is **RF**, and the **Input Port** is **RF Input 2**, and the Full Range Attenuator is installed:

On the Meas Bar, the field “Atten” displays as follows:

- If the sweep is entirely < 50 GHz, the value shown after “Atten:” is equal to Mech Atten + Elec Atten + Full Range Atten
- If the sweep is entirely > 50 GHz, the value shown after “Atten:” is equal to Full Range Atten
- If the sweep straddles 50 GHz, the value shown after “Atten:” is preceded by the symbol “>=” and is equal to Full Range Atten

In the **Amplitude**, "Y Scale" on page 2153 menu, and the Atten **Meas Bar** dropdown menu panel, a summary is displayed as follows:

“Total Atten below 50 GHz” followed by the value of Full Range Atten + Mech Atten + Elec Atten

“Total Atten above 50 GHz” followed by the value of Full Range Atten

For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown:

- Attenuator summary:
- Total Atten below 50 GHz: 30 dB
- Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models, and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to **Ref Level**, "Internal Preamp" on page 2183 Gain, any External Gain that is entered, and **Max Mixer Level** (if available), as described in the table below.

See "Attenuator Configurations and Auto/Man" on page 1008

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation <rel_ampl>` `[:SENSe]:POWer[:RF]:ATTenuation?`
Example	`:POW:ATT 20` Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of “main” attenuation) In either case, if the attenuator was in Auto, it is set to Manual
Dependencies	Some measurements do not support **Auto** setting of **Mech Atten**. In these measurements, the **Auto/Man** selection is not available, and the **Auto/Man** toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the **Auto/Man** toggle function is not available. The state of

	Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 2164 See "Attenuator Configurations and Auto/Man" on page 1008 for more information on the **Auto/Man** functionality
Couplings	If the RF Input Port is the RF Input: – If the USB Preamp is connected to USB, use 0 dB for **Mech Atten** – Otherwise compute the auto-selected value of **Mech Atten** based on **Reference Level**, **Int Preamp**, **External Gain**, **Ref Level Offset**, **Max Mixer Level**, **µW Path Control** and **IF Gain** settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) – In N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the value of "Full Range Atten" on page 2160 from the result to determine the **Mech Atten**. Limit the value so that it is never lower than 0 dB and so that total attenuation, including **Full Range Atten**, is never less than 6 dB (total attenuation, including **Full Range Atten** below 6 dB, can never be chosen by Auto) In External Mixing and BBIQ, where the attenuator is not in the signal path, the attenuator setting changes as described above when **Mech Atten** is in **Auto**, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input For CXA-m with Option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is <= 7.5 GHz. So, when the frequency is changed from below 7.5 GHz to above 7.5 GHz, the attenuation setting changes to a multiple of 10 dB that is no smaller than the previous setting. For example, 4 dB attenuation changes to 10 dB
Preset	**Auto** The Auto value is 10 dB
State Saved	Saved in instrument state
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased
Max	CXA Option 503 or 507: 50 dB EXA: 60 dB All other models: 70 dB Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as: *Atten: <total> dB (e<elec>)* The e letter is in amber in Single-Attenuator configurations

For example:

Dual-Attenuator configuration:

Atten: 24 dB (e14)

Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB

Single-Attenuator configuration:

A: 24 dB (e14)

Indicating the total attenuation is at 24 dB and the "soft" attenuation is at 14 dB (see below for definition of "soft" attenuation)

When in Manual, a # sign appears in front of Atten in the annotation

Auto Function

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:ATTenuation:AUTO?`
Example	Turn **Auto Mech Atten**ON: `:POW:ATT:AUTO ON`
Dependencies	`:POW:ATT:AUTO` is only available in measurements that support **Auto**, such as Swept SA
Preset	ON

Attenuator Configurations and Auto/Man

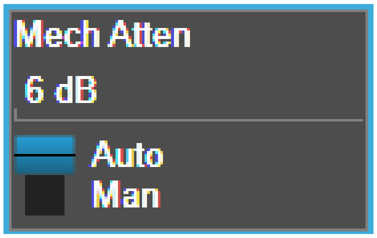
As described under "Attenuation" on page 2158, there are two distinct attenuator configurations available in the X-Series, the Single Attenuator and Dual-Attenuator configurations.

In Dual-Attenuator configurations, we have mechanical attenuation and electronic attenuation, and current total attenuation is the sum of electronic + mechanical attenuation.

In Single-Attenuator configurations, we refer to the attenuation set using "Mech Atten" on page 1006 (or `:POW:ATT`) as the "main" attenuation; and the attenuation that is set by `:POW:EATT` as the "soft" attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then current total attenuation is the sum of main + soft attenuation.

See "Elec Atten" on page 2164 for more about "soft" attenuation.

NOTE In some measurements, the **Mech Atten** control has an **Auto/Man** function. In these measurements, an **Auto/Man** switch is shown on the **Mech Atten** control:



Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no **Auto/Man** function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details of the Electronic Attenuator, see "More Information" on page 1011

Remote Command	`[:SENSe]:POWer[:RF]:EATTenuation <rel_ampl>` `[:SENSe]:POWer[:RF]:EATTenuation?`
Example	`:POW:EATT 10` `:POW:EATT?`
Notes	Electronic Attenuation's specification is defined only when **Mech Atten** is 6 dB
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no "electronic attenuator"; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, `EATT` SCPI commands are accepted for compatibility with other X-series instruments, and set a "soft" attenuation. The "soft" attenuation is treated as an addition to the "main" attenuation value set by the **Attenuation** control or `:POW:ATT`, and affects the total attenuation displayed on the **Attenuation**

	control and the Meas Bar The electronic attenuator, and the “soft” attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out If "Internal Preamp" on page 2183 is `ON` (that is, set to Low Band or Full), the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned If both the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence If the electronic/soft Attenuator is enabled, then the **Stop Freq** of the instrument is limited to 3.6 GHz and **Internal Preamp** is unavailable If "LNA" on page 2185 is `ON`, the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out. This coupling works in the following modes/measurements: – Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes – Transmit On|Off Power measurement in 5GNR Mode – Power vs. Time and Transmit Power measurement in GSM/EDGE Mode – Burst Power measurement in Spectrum Analyzer Mode The SCPI-only “soft” electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement
Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in "Mechanical Attenuator Transition Rules" on page 1011
Preset	0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the **Mech Atten** control description

Auto Function

Remote Command	`[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:EATTenuation:STATe?`
Example	`:POW:EATT:STAT ON`

	`:POW:EATT:STAT?`
Preset	`OFF` (Disabled) for Swept SA measurement `ON` (Enabled) for all other measurements that support the electronic attenuator

NOTE

The maximum **Center Frequency** for Low Band can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values <= 40 MHz have a maximum Low Band frequency of 3.6 GHz, while 40 MHz < IFBW <= 1 GHz have a maximum of 3.3 GHz, and 1 GHz < IFBW <= 1.5 GHz have a maximum of 3.5 GHz. This frequency is reflected in the disabled message displayed for Electrical Attenuator. For N9032B and N9042B IFBW values > 1.5 GHz do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, the Electrical Attenuator will remain disabled no matter the Center Frequency.

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See "Using the Electronic Attenuator: Pros and Cons" on page 1012 for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the “soft” attenuation feature replaces the Dual-Attenuator configuration’s electronic attenuator. All the same couplings and limitations apply. See "Attenuator Configurations and Auto/Man" on page 2163

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled

- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the

electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "Pre-Adjust for Min Clipping" on page 2168.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Example	`:POW:RANG:OPT IMM`
Notes	Executing **Adjust Atten for Min Clipping** initiates the measurement
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate` is executed.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLy | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?`
Example	`:POW:RANG:OPT:TYPE EONL` `:POW:RANG:OPT:TYPE?`
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	`COMBined`
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is `ON`, it applies the adjustment described under "Adjust Atten for Min Clipping" on page 2167 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "Adjustment Algorithm" on page 1015

Selection	SCPI	Note
Off	`OFF`	This is the default setting
On	`ON`	Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the `ON` parameter is supported and mapped to `COMBined`
Elec Atten Only	`ELECtrical`	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Elec+Mech Atten	`COMBined`	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Example	`:POW:RANG:OPT:ATT OFF` `:POW:RANG:OPT:ATT?`
Notes	The parameter option `ELECtrical` sets this function to `ON` in Single-Attenuator models The parameter option `COMBined` is mapped to `ELECtrical` in Single-Attenuator models. If you send `COMBined`, it sets the function to `ON` and returns `ELEC` to a query For SCPI compatibility with models that do not have an input attenuator, the `ON` parameter is honored and mapped to `COMBined`
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when "Elec Atten" on page 2164 is `OFF` or grayed-out, "Pre-Adjust for Min Clipping" on page 1014 is grayed-out Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	`OFF` when Elec Atten is Disabled at preset, otherwise `ELEC`
State Saved	Saved in instrument state

Range	Dual-Attenuator models:	Off | Elec Atten Only | Mech + Elec Atten
	Single-Attenuator models:	Off | On

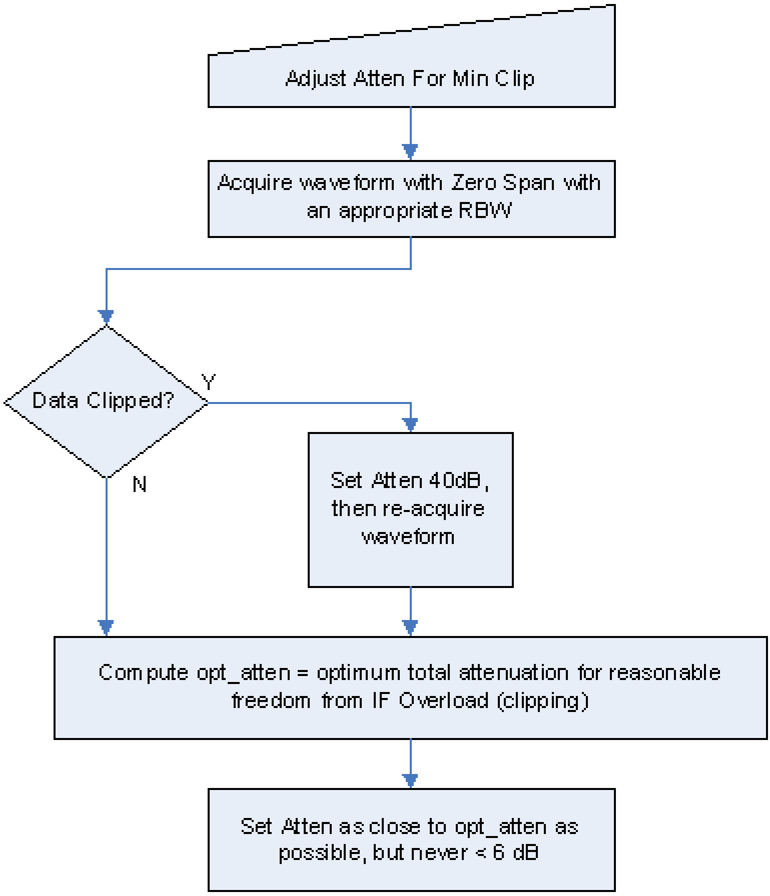
Backwards Compatibility Command

Notes	`ON` aliases to "Elec Atten Only" (`:POW:RANG:OPT:ATT ELEC`) `OFF` aliases to "Off" (`:POW:RANG:OPT:ATT OFF`) `:POW:RANG:AUTO?` returns true if `:POW:RANG:OPT:ATT` is not `OFF`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:RANGe:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:RANGe:AUTO?`

Adjustment Algorithm

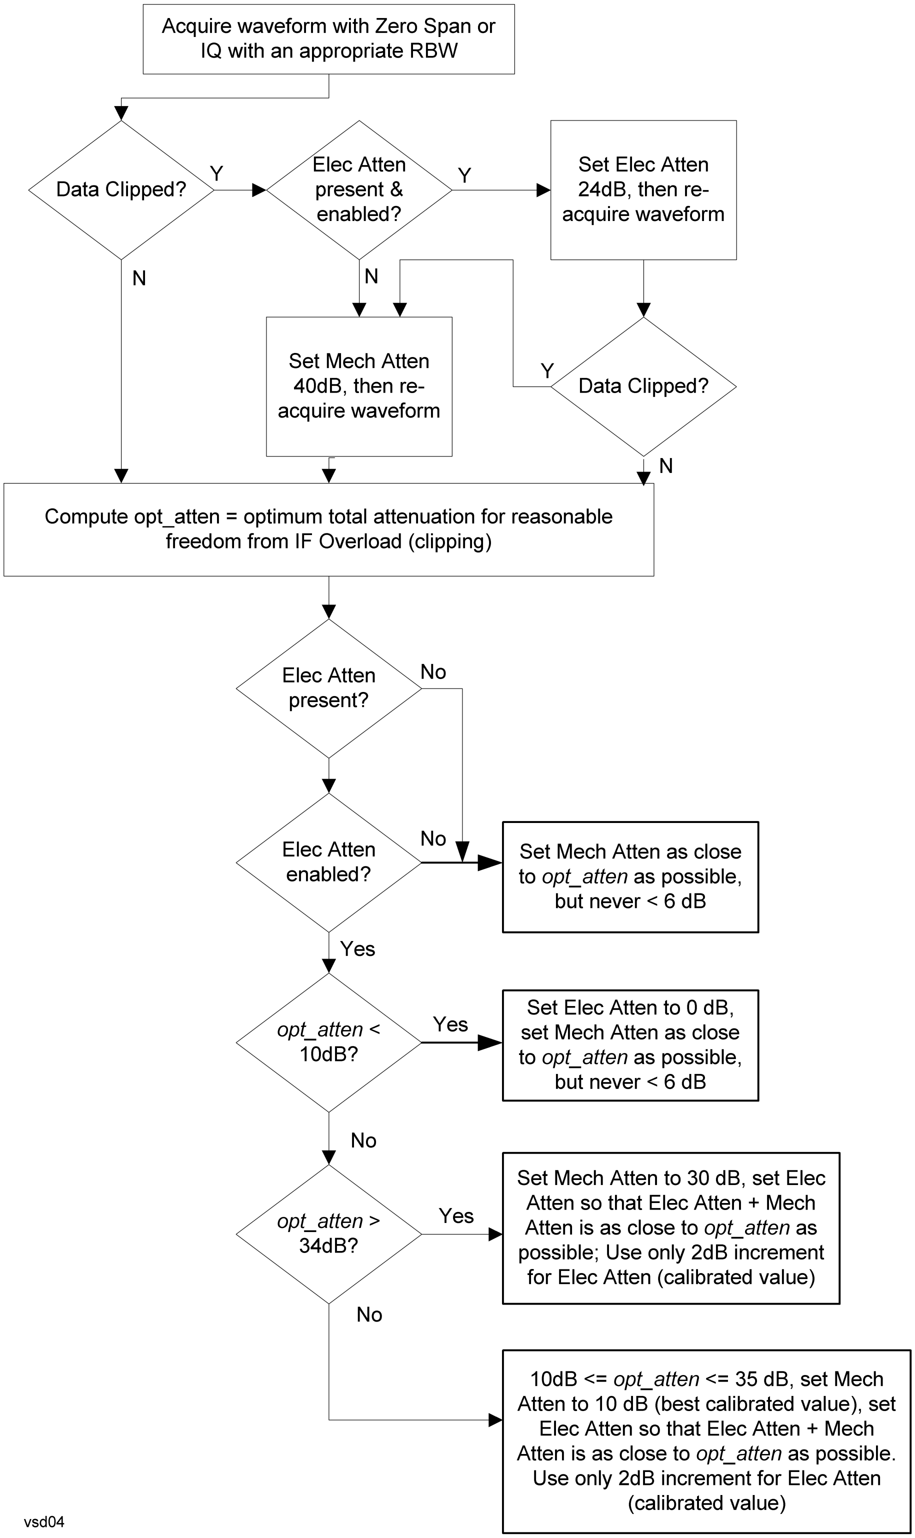
The algorithms for the adjustment are documented below:

Single-Attenuator Models



Dual-Attenuator models

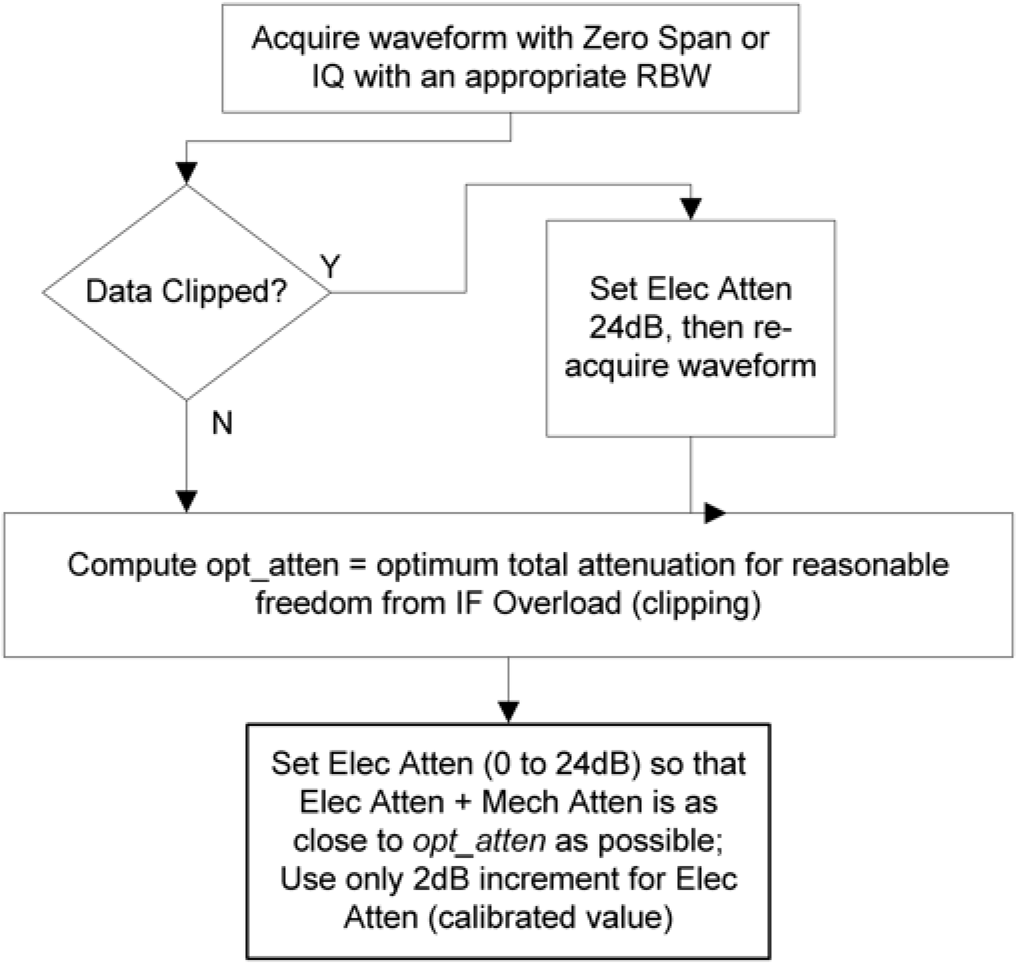
"Adjust Atten for Min Clipping" on page 2167 or "Pre-Adjust for Min Clipping" on page 1014 selection is Mech + Elec Atten:



Acquire waveform with Zero Span or IQ with an appropriate RBW
Data Clipped?
Y
N
Elec Atten present & enabled?
Y
N
Set Elec Atten 24dB, then re-acquire waveform
Set Mech Atten 40dB, then re-acquire waveform
Y
Data Clipped?
N
Compute opt_atten = optimum total attenuation for reasonable freedom from IF Overload (clipping)
Elec Atten present?
No
Elec Atten enabled?
No
Set Mech Atten as close to *opt_atten* as possible, but never < 6 dB
Yes
opt_atten < 10dB?
Yes
Set Elec Atten to 0 dB, set Mech Atten as close to *opt_atten* as possible, but never < 6 dB
No
opt_atten > 34dB?
Yes
Set Mech Atten to 30 dB, set Elec Atten so that Elec Atten + Mech Atten is as close to *opt_atten* as possible; Use only 2dB increment for Elec Atten (calibrated value)
No
10dB <= *opt_atten* <= 35 dB, set Mech Atten to 10 dB (best calibrated value), set Elec Atten so that Elec Atten + Mech Atten is as close to *opt_atten* as possible. Use only 2dB increment for Elec Atten (calibrated value)
vsd04

"Pre-Adjust for Min Clipping" on page 1014 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.



Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?`
Example	`:POW:ATT:STEP 2` `:POW:ATT:STEP?`
Notes	Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

3.6.3.3 Range (Non-attenuator models)

Only available for Keysight’s modular signal analyzers and certain other Keysight products, such as VXT and M941xE.

State Saved	No

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe <real>` `[:SENSe]:POWer[:RF]:RANGe?`
Example	`:POW:RANG 10 dBm` `:POW:RANG?`
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the **Center Frequency** The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min/Max	–/+100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements

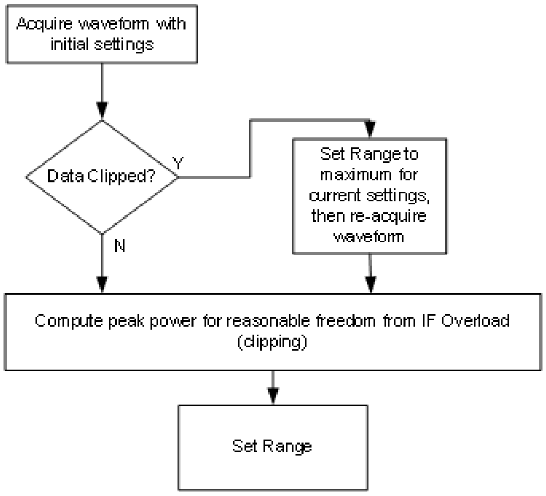
Pre-Adjust for Min Clipping

If this function is `ON`, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Notes	Because there is no attenuator control available in these models, the control displays only `ON` and `OFF` choices. However, for SCPI compatibility with other platforms, all three parameters (`ELECtrical`, `COMBined`, and `ON`) are honored and all are mapped to `ELECtrical`, so if any of these three parameters is sent, a subsequent query will return `ELEC`
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements
Preset	`OFF` for Swept SA measurement; `ON` for all other measurements that support **Pre-Adjust for Min Clipping**
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:



Peak-to-Average Ratio

Used with "Range (Non-attenuator models)" on page 2177 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:PARatio <real>` `[:SENSe]:POWer[:RF]:RANGe:PARatio?`
Example	`:POW:RANG:PAR 12 dB`
Notes	In some Modes, this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempts to change the value via SCPI are ignored, but no error message is generated
Dependencies	Does not appear in Spectrum Analyzer Mode
Preset	VXT Models M9410A/11A: 0 dB All Others: 10 dB
State Saved	Saved in instrument state
Min	0 dB
Max	VXT Models M9410A/11A: 50 dB All Others: 20 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument’s IF. This setting can be used when additional optimization is needed after setting "Peak-to-Average Ratio" on page 2179. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real>` `[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?`	
Example	`:POW:RANG:MIX:OFFS -5 dB`	
Preset	0 dB	
State Saved	Saved in instrument state	
Min	VXT Models M9410A/11A	-34 dB
	All Others	-35 dB
Max	30 dB	

3.6.3.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9420A, or UXM.

This tab *does* appear in VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E, because "Software Preselection" on page 2195 is under this tab, and VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker’s center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker’s frequency. If the selected marker is already on, but outside the frequency range

between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "Preselector Adjust" on page 2182 changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in "Proper Preselector Operation" on page 1023.

Remote Command	`[:SENSe]:POWer[:RF]:PCENter`
Example	`:POW:PCEN`
Notes	The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command
Dependencies	Does not appear in CXA-m, nor in VXT Models M9410A/11A/15A/16A, M9410E/11E/15E/16E Grayed-out if the microwave preselector is off – If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken – Grayed-out if entirely in Band 0, that is, if **Stop Freq** is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if **Start Freq** is above 50 GHz – Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 – Grayed-out in the **Spectrogram** View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering appears in "Preselector Adjust" on page 2182
Status Bits/OPC dependencies	When centering the preselector, `*OPC` does not return true until the process is complete and a subsequent measurement has completed, nor are results returned in response to `:READ` or `:MEASure` queries The `Measuring` bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak

search to find

2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "Presel Center" on page 2181 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	`[:SENSe]:POWer[:RF]:PADJust <freq>` `[:SENSe]:POWer[:RF]:PADJust?`
Example	`:POW:PADJ 100KHz` `:POW:PADJ?`
Notes	The value on the control is displayed to 0.1 MHz resolution
Dependencies	– Does not appear in CXA-m – Does not appear in VXT Models M9410A/11A/15A/16A – Does not appear in M9410E/11E/15E/16E – Grayed-out if microwave preselector is off – Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz – Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the **Spectrogram** View
Preset	0 MHz

State Saved	The **Preselector Adjust** value set by "Presel Center" on page 2181, or by manually adjusting **Preselector Adjust** Not saved in instrument state, and does not survive a Preset or power cycle
Min/Max	–/+500 MHz
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PADJust` `[:SENSe]:POWer[:RF]:MMW:PADJust`

Backwards Compatibility Command

Notes	The command has no effect, and the query always returns `MWAVe`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVe | MMWave | EXTernal` `[:SENSe]:POWer[:RF]:PADJust:PRESelector?`

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec’d below 9 kHz".

Selection	Example	Note
Off	:POW:GAIN OFF	
Low Band	:POW:GAIN ON :POW:GAIN:BAND LOW	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	:POW:GAIN ON :POW:GAIN:BAND FULL	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE The maximum **Center Frequency** for **Low Band**, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values <= 40 MHz have a maximum **Low Band** frequency of 3.6 GHz, while 40 MHz < IFBW <= 1 GHz have a maximum of 3.3 GHz, and 1 GHz < IFBW <= 1.5 GHz have a maximum of 3.5 GHz. IFBW values > 1.5 GHz do not support a **Center Frequency** that can reach the **Low Band** maximum frequency. In these cases, **N/A** is displayed in the square brackets for **Low Band**.

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:BAND LOW | FULL` `[:SENSe]:POWer[:RF]:GAIN:BAND?`
Example	`:POW:GAIN:BAND LOW` `:POW:GAIN:BAND?`
Dependencies	Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A nor in M9410E/11E/15E/16E If `:POW:GAIN:BAND FULL` is sent when a low band preamp is available, the preamp band parameter is set to `LOW` instead of `FULL`, and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled
Preset	`LOW`
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says “Off” if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says “3.6 GHz”. If it is a 13.6 GHz preamp and it is set to Full Range the annotation says “13.6 GHz” When the USB Preamp is connected to USB, the Preamp annotation says “Preamp: USB” if the internal preamp is off or “Preamp: USB, Int” if the internal preamp is on (only for measurements that support the USB preamp)

Auto Function

Remote Command	`[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN[:STATe]?`
Example	`:POW:GAIN OFF` `:POW:GAIN?`
Preset	`OFF`

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to "Internal Preamp" on page 2183. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

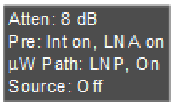
For best possible sensitivity, **LNA** can be turned on *together* with "Internal Preamp" on page 2183, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see "More Information" on page 1027

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?`
Example	`:POW:GAIN:LNA ON`
Dependencies	Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9420A/10A/11A M9410E/11E/15E/16E support LNA May not appear in some measurements **LNA** is not available when the electronic/soft attenuator is enabled
Preset	`OFF`
State Saved	Saved in State

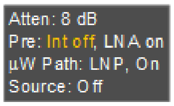
More Information

When **LNA** is installed, the preamp annotation changes to show the state of both **LNA** and **Internal Preamp**. Below is an example:



Atten: 8 dB
Pre: Int on, LNA on
µW Path: LNP, On
Source: Off

Note that when operating entirely in the low band (below about 3.6 GHz), if **LNA** is on, **Internal Preamp** is switched off (even if you have its switch set to ON). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:



Atten: 8 dB
Pre: Int off, LNA on
µW Path: LNP, On
Source: Off

µW Path Control

Options for this control include **µW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the µW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **µW Preselector Bypas**s, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the µW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21-26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **µW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. µW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See "Low Noise Path Enable" on page 1032
µW Preselector Bypass	:POW:MW:PATH MPB	See "µW Preselector Bypass" on page 1034
Full Bypass Enable	:POW:MW:PATH FULL	See "Full Bypass Enable" on page 1035

<table>
<tr><td>Remote Command</td><td><code>[:SENSe]:POWer[:RF]:MW:PATH STD | LNPath | MPBypass | FULL</code>
<code>[:SENSe]:POWer[:RF]:MW:PATH?</code></td></tr>
<tr><td>Example</td><td><code>:POW:MW:PATH LNP</code>
Enables the Low Noise path
<code>:POW:MW:PATH?</code></td></tr>
<tr><td>Notes</td><td>When "Presel Center" on page 2181 is performed, the instrument momentarily switches to the Standard Path, regardless of the setting of µW Path Control
The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean “when the low noise path is enabled” but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is Low Noise Path Enable or Full Bypass Enable. In the case where the DC Block is switched in, the instrument is now AC-coupled. However, if you selected DC coupling, the UI would still behave as though it were DC-coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC-coupled
Alignment switching ignores the settings in this menu, and restores them when finished</td></tr>
<tr><td>Dependencies</td><td>Does not appear in CXA-m, VXT Models M9410A/11A/15A/16A, nor in M9410E/11E/15E/16E, BBIQ and External Mixing
– The Low Noise Path Enable selection does not appear unless Option LNP is present and licensed
– The µW Preselector Bypass selection does not appear unless Option MPB is present and licensed
– The Full Bypass Enable selection does not appear unless options LNP and MPB are both present as well as option FBP
In any of these cases, if the required options are not present and the SCPI command is sent, error -241, "Hardware missing; Option not installed" is generated
Low Noise Path Enable and Full Bypass Enable are grayed-out if the current measurement does not support them
Low Noise Path Enable and Full Bypass Enable are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, “Setting Conflict; Feature not supported for this measurement”</td></tr>
<tr><td>Preset</td><td><table><tr><th>Mode</th><th>Value</th></tr><tr><td>IQ Analyzer
Pulse

</table>

Annotation	In the Meas Bar, if the Standard path is chosen: µW Path: Standard If Low Noise Path is enabled but the LNP switch is not thrown: µW Path: LNP,Off If the Low Noise Path is enabled and the LNP switch *is* thrown: µW Path: LNP,On If the preselector is bypassed: µW Path: Bypass If Full Bypass Enable is selected but the LNP switch is not thrown: µW Path: FByp,Off If Full Bypass Enable is selected and the LNP switch *is* thrown: µW Path: FByp,On

µW Path Control Auto

In VMA, WLAN, 5G NR, CQM Modes, an **Auto/Man** switch is added to **µW Path Control**:

This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

Measurement	µW Path Control Auto behavior
Digital Demod	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Custom OFDM	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Measurement	µW Path Control Auto behavior
ACP	Always Presel Bypass
SEM	Always Presel Bypass
Spurious Emissions	Always Standard Path

WLAN Mode

Measurement	µW Path Control Auto behavior
Modulation Analysis	Always Presel Bypass
Spectral Flatness	Always Presel Bypasss
Power vs Time	Always Presel Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Always Presel Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Always Presel Bypass
SEM	For 11be 320M, when 'Enabled Wideband IF for FFT' is OFF or 'Sweep Type Rule' is Best Dynamic Range, auto µW path is standard For other cases, auto µW path is presel bypass if presel bypass is enabled, auto µW path is standard if presel bypass is not enabled

Remote Command	`[:SENSe]:POWer[:RF]:MW:PATH:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:MW:PATH:AUTO?`
Example	`:POW:MW:PATH:AUTO ON` `:POW:MW:PATH:AUTO?`
Dependencies	Only appears in VMA, WLAN, 5G NR and CQM Modes
Couplings	See "µW Path Control Auto" on page 1030 above
Preset	`ON`
Range	`ON|OFF`

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used,

whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

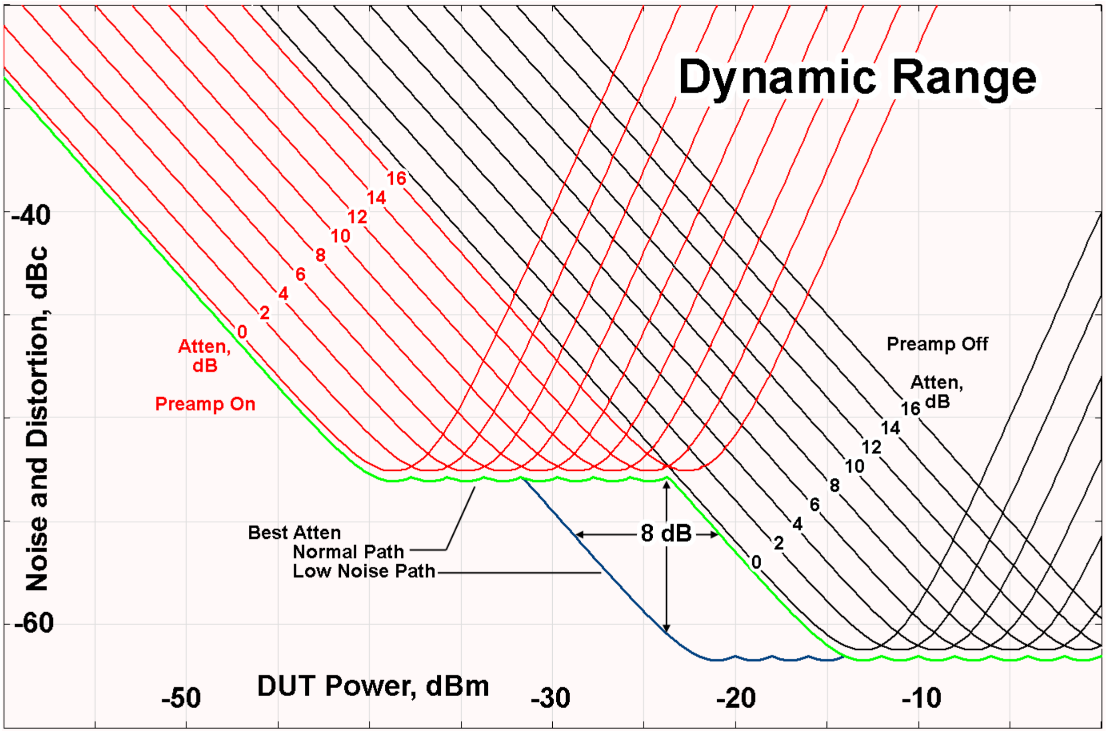
Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.



There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

µW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave presel is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When Full Bypass Enable is selected, and "Y Scale" on page 2153 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently,

whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

Microwave Preselector Bypass Backwards Compatibility

Example	Bypass the microwave preselector: `:POW:MW:PRES OFF`
Notes	Included for Microwave Preselector Bypass backwards compatibility The `ON` parameter sets the `STD` path (`:POW:MW:PATH STD`) The `OFF` parameter sets path `MPB` (`:POW:MW:PATH MPB`)
Preset	`ON`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON | OFF | 0 | 1` `[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?`

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender's preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is `OFF`, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

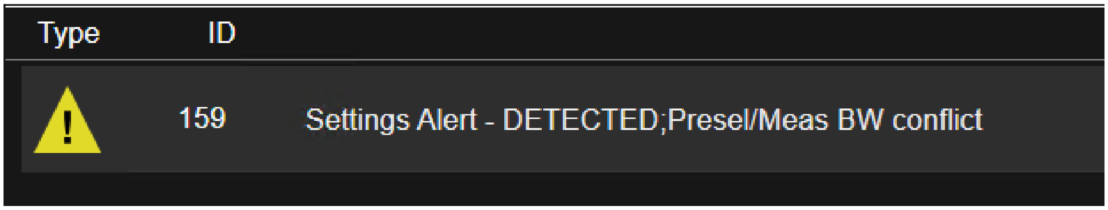
An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert;Presel/Meas BW conflict

Settings Alert message in the error queue

.



Type	ID	
⚠	159	Settings Alert - DETECTED;Presel/Meas BW conflict

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A/15A/16A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection `ON` at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:STATe 0 | 1 | ON | OFF` `[:SENSe]:POWer[:RF]:SWPresel:STAT?`
Example	`:POW:SWPR:STAT 1` `:POW:SWPR:STAT?`
Dependencies	Only appears in N9041B, N9042B+V2050A, VXT models M9410A/11A and M9410E/11E. Does not appear in all measurements
Couplings	Affects **Sweep Time** **Auto Tune** supports **Software Preselection**, so **Auto Tune** should be performed after setting the **Software Preselection** state
Preset	N9041B: `OFF` N9042B+V3050A: `ON` M9410A/11A: `ON`
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by 2 * IF / N. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- `NORMal` - mathematically removes all image and multiple responses of signals present at the input
- `ADVanced` - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel NORMal | ADVanced` `[:SENSe]:POWer[:RF]:SWPResel?`
Example	`:POW:SWPR NORM` `:POW:SWPR?`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 2195 is `OFF`. The grayout message is “Unavailable unless SW Presel enabled”
Preset	N9041B: `ADVanced` N9042B+V3050A: `NORMal`
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- `NORMal` – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for `NARRow` (below)
- `NARRow`– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from

wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:BW NORMal | NARRow` `[:SENSe]:POWer[:RF]:SWPResel:BW?`
Example	`:POW:SWPR:BW NARR`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 2195 is `OFF`. The grayout message is “Unavailable unless SW Presel enabled” For N9042B+V3050A, the parameter is SCPI-only, and always set to `NARRow` when **Software Preselection** is enabled
Preset	N9041B: `NORMal` N9042B+V3050A: `NARRow`
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A and M9410E/11E in bypass frequency range (1310MHz~5GHz), the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the “Prefilter” bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	`[:SENSe]:<measurement>:PFILter[:STATe] ON | OFF | 1 | 0` `[:SENSe]:<measurement>:PFILter[:STATe]?`

Example	Enable High Freq Prefilter for the Complex Spectrum Measurement in `BASIC` Mode:
	`:SPEC:PFIL ON`
	Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes:
	`:WAV:PFIL ON`
	Enable High Freq Prefilter for the Swept SA Measurement in `SA` Mode:
	`:SAN:PFIL ON`

Dependencies	Only appears in VXT models M9410A/11A with center frequency above 1310 MHz, and M9410E/11E in frequency range 1310MHz~5GHz
Preset	See "Prefilter Presets" on page 1041 below
State Saved	Saved in instrument state

Prefilter Presets

Meas	Mode	Preset
SPEC	BASIC	OFF
WAV	BASIC, WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
MON	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
RHO	WCDMA	OFF
CDP	WCDMA	OFF
PCON	WCDMA	OFF
EVMQ	WCDMA	OFF
CHP	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
OBW	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
ACP	WCDMA, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
SEM	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF

HARM	SA	ON

3.6.4 BW

There is no **BW** functionality in this measurement.

3.6.5 Display

Opens the **Display** menu, which lets you configure display items for the current Mode, Measurement View or Window.

3.6.5.1 Meas Display

Contains controls for setting up the display for the current Measurement, View, or Window.

Center Frequency On/Off

Turns the display of **Center Frequency** on the **Meas Bar** On or Off.

Remote Command	`:DISPlay:SPURious:FREQuency:CENTer[:STATe] ON | OFF | 1 | 0` `:DISPlay:SPURious:FREQuency:CENTer[:STATe]?`
Example	`:DISP:SPUR:FREQ:CENT ON` `:DISP:SPUR:FREQ:CENT?`
Preset	`ON`
State Saved	Yes

3.6.5.2 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	`:DISPlay:GRATicule[:STATe] OFF | ON | 0 | 1` `:DISPlay:GRATicule[:STATe]?`
Example	`:DISP:GRAT OFF`
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	`ON`
State Saved	Saved in instrument state

Backwards Compatibility SCPI	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF | ON | 0 | 1`
	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?`
	This command is accepted for backwards compatibility with older instruments, but the `WINDow`, `TRACe` and `GRID` parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When `OFF`, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	`:DISPlay:ANNotation:SCReen[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:SCReen[:STATe]?`
Example	`:DISP:ANN:SCR OFF`
Dependencies	Grayed-out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with ….

Remote Command	`:DISPlay:ANNotation:TRACe[:STATe] ON | OFF | 1 | 0` `:DISPlay:ANNotation:TRACe[:STATe]?`
Example	`:DISP:ANN:TRAC OFF`
Preset	`OFF`
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	`:DISPlay:ACTivefunc[:STATe] ON | OFF | 1 | 0` `:DISPlay:ACTivefunc[:STATe]?`
Example	`:DISP:ACT OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON`

	This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	`:DISPlay:ANNotation:MBAR[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:MBAR[:STATe]?`
Example	`:DISP:ANN:MBAR OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. Theare three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor :SYSTem:PRESet enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are using either the `:SYSTem:KLOCk` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is `OFF`, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

Name	Command
Select User View	`:DISPlay:VIEW:ADVanced:SELect`
Rename User View	`:DISPlay:VIEW:ADVanced:REName`
Delete User View	`:DISPlay:VIEW:ADVanced:DELete`
Create User View	`:DISPlay:VIEW:ADVanced:NAME`
Select Screen	`:INSTrument:SCReen:SELect`
Delete Screen	`:INSTrument:SCReen:DELete`
Delete All But This Screen	`:INSTrument:SCReen:DELete:ALL`
Add Screen	`:INSTrument:SCReen:CREate`
Rename Screen	`:INSTrument:SCReen:REName`
Sequencer On/Off	`:SYSTem:SEQuencer`

Remote Command	`:DISPlay:ENABle OFF | ON | 0 | 1` `:DISPlay:ENABle?`
Example	`:DISP:ENAB OFF`
Couplings	`:DISP:ENAB OFF` turns Backlight `OFF` and `:DISP:ENAB ON` turns Backlight `ON`, but changing Backlight settings does *not* change the state of `:DISP:ENAB`
Preset	`ON` Set by `:SYST:DEF MISC`, but not affected by `*RST` or `:SYSTem:PRESet`
State Saved	Not saved in instrument state
Backwards Compatibility Notes	`:SYST:PRES` no longer turns on `:DISPlay:ENABle` as it did in legacy analyzers

3.6.5.3 View

Contains controls for selecting the current **View**, and for editing User Views.

Views

This measurement has two predefined views:

#	Name	SCPI
1	"Graph + Metrics" on page 1046	`RESult`
2	"All Ranges" on page 1046	`ALL`

These are multiple-window views. When in a multiple-window view, you select a window by touching it. The menu controls may sometimes change, depending on which window is selected.

Remote Command	`:DISPlay:SPURious:VIEW[:SELect] RESult | ALL` `:DISPlay:SPURious:VIEW[:SELect]?`
Example	`:DISP:SPUR:VIEW RANG` `:DISP:SPUR:VIEW?`
Preset	`RESult`
State Saved	No
Range	Graph + Metrics | All Ranges

Graph + Metrics

Windows: "Graph" on page 997,"Table" on page 998

Select Graph + Metrics to view measurement results.

- The upper window displays a trace of the range that contains the currently selected spur
- The lower window displays a list of spurs detected in a measurement cycle. The currently selected spur, which is highlighted, can be changed by the Spur control in the Meas Setup menu

Example	`:DISP:SPUR:VIEW RES`

All Ranges

Windows: "Graph" on page 997,

Select All Ranges to view measurement results for all the ranges.

- The upper window displays a merged trace of all the ranges
- The lower window displays a list of spurs detected in a measurement cycle. The currently selected spur, which is highlighted, can be changed by the Spur control in the Meas Setup menu

Example	`:DISP:SPUR:VIEW ALL`

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:SELect <alphanumeric>` `:DISPlay:VIEW:ADVanced:SELect?`
Example	Select Baseband as the current View `:DISP:VIEW:ADV:SEL “Baseband”`

Notes	You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command
	For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	because “Trace Zoom” is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu
	You *cannot* use the legacy View parameter (which in this case would be `TZOom`) with `:DISP:VIEW:ADV:SEL`
	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	`:DISP:VIEW:ADV:SEL "TRACE ZOOM"`
	If the specified view is not a valid View, the query returns the error message “-224, Illegal parameter value; View with the name <alphanumeric> does not exist”
	If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated

Backwards Compatibility SCPI	The legacy node `:DISPlay:VIEW[:SELect]` is retained for backwards compatibility, but it only supports predefined views

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a “User View”.

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	`:DISPlay:VIEW:ADVanced:NAME <alphanumeric>`

Example	`:DISP:VIEW:ADV:NAME “Baseband”` Creates a new View named `Baseband` from the current View, and selects it as the current View
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If `<alphanumeric>` name already exists as a View, the error message “-224, Illegal parameter value; View <alphanumeric> already exists” is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; User View SCPI cannot be used while Display is disabled” is generated

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View’s name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	`:DISPlay:VIEW:ADVanced:REName <alphanumeric>`
Example	`:DISP:VIEW:ADV:REN “Baseband”`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` specifying the new name is already present in the list of View names, the error message “-224, Illegal parameter value; View <alphanumeric> already exists” is generated If the current View is a Predefined View, the error message “-224, Illegal parameter value; Cannot rename a Predefined View” is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete`
Example	`:DISP:VIEW:ADV:DEL`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` is not present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> does not exist" is generated If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot delete a Predefined View" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete:ALL`
Example	`:DISP:VIEW:ADV:DEL:ALL`
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SELect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:CATalog?`
Example	`:DISP:VIEW:ADV:CAT?`
Notes	Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for *all* the Views, including User Views, available for the current Measurement Example: `"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"`

	No distinction is made between Predefined and User Views If you switch measurements with the display disabled (via `:DISP:ENAB OFF`), then query the list of available Views, the result is undefined

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:USER:CATalog?`
Example	`:DISP:VIEW:ADV:USER:CAT?`
Notes	Returns a quoted string of the available User Views for the current measurement, separated by commas. Example: `"Baseband,myView1,yourView1"` If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 2211), then query the list of available Views, the result is undefined

3.6.6 Frequency

Opens the **Frequency** menu, which contains controls that allow you to control the Frequency and Channel parameters of the instrument.

Some settings in the **Frequency** menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by "Meas Preset" on page 1096. For example, Center Frequency is the same for all measurements - it does not change as you change measurements.

3.6.6.1 Settings

Contains controls that pertain to the X axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Carrier Reference Frequency

Sets Carrier Reference Frequency. The center frequencies of carriers are defined as offset frequency from this value. This reference frequency is also the reference of carrier configuration preset.

Because LTE-A, MSR and 5G NR measurements often deal with multiple carriers with distinct bandwidths, the simple **Center Frequency** parameter used in most measurements does not apply here. Instead, **Carrier Reference Frequency** is the key parameter.

In LTE-A and 5G NR Modes, if the following conditions are satisfied at the same time:

- Number of Component Carriers is 1
- Center Freq Offset is 0 Hz
- Center Frequency mode is Auto

then **Center Frequency** is equivalent to **Carrier Reference Frequency**. When **Center Frequency** changes in such conditions, **Center Frequency** mode remains Auto, and **Carrier Reference Frequency** changes to the same value. The major purpose of this coupling is to maintain backwards compatibility with legacy LTE/LTE TDD, in which `:SENSe:FREQuency:CENTer` is used to set up the frequency of the measurement.

See "More Information" on page 1051

Remote Command	For LTE-A, 5G NR Modes:
	`[:SENSe]:CCARrier:REFerence <freq>`
	`[:SENSe]:CCARrier:REFerence?`
	For MSR Mode:
	`[:SENSe]:CARRier:REFerence <freq>`
	`[:SENSe]:CARRier:REFerence?`

Example	For LTE-A, 5G NR Modes:
	`:CCAR:REF 2GHz`
	`:CCAR:REF?`
	For MSR Mode:
	`:CARR:REF 2GHz`
	`:CARR:REF?`

Dependencies	Only available in LTE-A FDD/TDD, 5G NR and MSR Modes
Preset	1GHz
State Saved	Saved in instrument state
Min/Max	Depends on instrument minimum center frequency. Same as **Center Frequency**

More Information

In most applications, **Center Frequency** is generally where the carrier center is located, and thus plays a very important role. However, in LTE-Advanced TDD/FDD Modes, the measurements are based on carrier center frequencies and bandwidths, both of which are calculated or obtained according to the carriers’ configuration.

The **Center Frequency** defined here is only for the Monitor Spectrum, IQ Waveform and CCDF measurements, because these are general type measurements and focus on a certain frequency range, which may be the entire BS RF bandwidth, a frequency range of one of the component carriers, or a range far away from the component carriers to see spurious. The **Center Frequency** in these three measurements has a different meaning, therefore it is a separate setting from **Carrier Reference Frequency**.

Carrier center frequencies are defined using offsets from **Carrier Reference Frequency**, which determine absolute frequency locations, and which can be set as both absolute and relative frequency from the carrier reference frequency.

Since **Center Frequency** is only used in those three measurements, Monitor Spectrum, IQ Waveform and CCDF, this control only appears on the Frequency menu of these measurements.

3.6.7 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, **Marker** selects marker 1, sets it to Normal and places it at the center of the display. If the selected marker is Off, it is set to Normal and placed it at the center of the screen on the trace determined by the **Marker Trace** rules.

3.6.7.1 Select Marker

Specifies the selected marker. The term “selected marker” is used throughout this document to specify which marker will be affected when you change marker settings, perform a **Peak Search**, etc.

The **Select Marker** control appears above the menu panel, indicating that it applies to all controls in the Marker menu panels. **Select Marker** is blanked if you select a tab whose controls do *not* depend on the selected marker (for example, Counter).

On any menu tab that displays **Select Marker**, the first control is always **Marker Frequency | Time**.

Notes	The selected marker is remembered even when not in the **Marker** menu and is used if a Search is done, or a Band Function is turned on, or for Signal Track, or Continuous Peak
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for **Normal** and **Delta** markers

3.6.7.2 Settings

The controls on this tab include the **Marker** active function and a radio button selection for the marker control mode (**Normal**, **Delta**, or **Off**) for the selected marker, as well as additional functions that help you use markers.

Marker Frequency

Sets the marker X-Axis value in the current marker X-Axis Scale unit. It has no effect if the control mode is `OFF`, but is the SCPI equivalent of entering an X value if the control mode is **Normal** (`POSition`) or `DELTa`.

Remote Command	`:CALCulate:SPURious:MARKer[1]|2|…|12:X <freq>` `:CALCulate:SPURious:MARKer[1]|2|…|12:X?`
Example	`:CALC:SPUR:MARK2:X 25 kHz` `:CALC:SPUR:MARK3:X?`
Notes	If no suffix is sent, uses the fundamental units for the current marker X Axis Scale. If a suffix is sent that does not match the current marker X Axis Scale unit, an error “Invalid suffix” is generated The query returns the marker’s absolute X Axis value if the control mode is **Normal**, or the offset from the marker’s reference marker if the control mode is **Delta.** The query is returned in the fundamental units for the current marker X Axis scale: Hz for **Frequency** and Inverse Time, seconds for Period and Time
Preset	After a preset, all markers are turned `OFF`, so Marker X-Axis Value query returns Not A Number (`NAN`)
State Saved	Saved in instrument state
Min/Max	–/+9.9E+37
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Marker X Axis Position (Remote Command Only)

Sets the marker X-Axis Scale position in trace points. This setting has no effect if the control mode is **Off,** but is the SCPI equivalent of entering a value if the control mode is **Normal** or **Delta** - except in trace points rather than X-Axis Scale units. The entered value is immediately translated into the current X-Axis Scale units for setting the value of the marker.

Remote Command	`:CALCulate:SPURious:MARKer[1]|2|…|12:X:POSition <real>` `:CALCulate:SPURious:MARKer[1]|2|…|12:X:POSition?`
Example	`:CALC:SPUR:MARK10:X:POS 300` `:CALC:SPUR:MARK10:X:POS?`
Notes	The query returns the marker’s absolute X-Axis value in trace points if the control mode is **Normal**, or the offset from the marker’s reference marker in trace points if the control mode is **Delta.** The value is returned as a real number, not an integer, corresponding to the translation from X-Axis Scale units to

	trace points . When a Marker is turned on, it is placed center of the screen on the trace. Therefore, the default value depends on instrument condition. If the marker is `OFF`, the response is Not A Number
Preset	After a preset, all markers are turned `OFF`, so Marker X-Axis Value query returns Not A Number (`NAN`)
State Saved	Saved in instrument state
Min/Max	–/+9.9E+37

Marker Y Axis Value (Remote Query only)

Returns the marker Y Axis value in the current marker Y Axis unit.

Remote Command	`:CALCulate:SPURious:MARKer[1]|2|…|12:Y?`
Example	`:CALC:SPUR:MARK11:Y?`
Notes	Returns the marker Y-Axis result, if the control mode is **Normal** or **Delta**. If the marker is `OFF`, the response is Not A Number In the Complex Spectrum measurement, when the marker is on and Marker Trace is set to IQ, it returns I and Q values Case #1 - MarkerTrace SPEC, I or Q: returns a single double value – `>:CALC:SPEC:MARK1:Y?` – `-2.402406506109E+001` Case #2 - MarkerTrace IQ: returns a double array of two values, the first is I, and the second is Q – `>:CALC: SPEC:MARK1:Y?` – `-3.006944493834E-003,+9.9870666467354E-004` The IQ selection is for backward compatibility purposes. It is recommended that the users use the I and/or Q selection instead
Preset	Result dependent on Marker setup and signal source
State Saved	No
Backwards Compatibility SCPI	`:CALCulate:SPURious:MARKer[1]|2|…|12:FUNCtion:RESult?`

Marker Mode

Sets the marker control mode to `POSition` (**Normal**), `DELta`, or `OFF`. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is `OFF`, pressing **Marker** sets it to `POSition` and places it at the center of the screen on the trace determined by the **Marker Trace** rules. At the same time, **Marker X Axis Value** appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is `OFF`, there is no active function, and the active function is turned off.

Remote Command	`:CALCulate:SPURious:MARKer[1]|2|…|12:MODE POSition | DELTa | OFF` `:CALCulate:SPURious:MARKer[1]|2|…|12:MODE?`
Example	`:CALC:SPUR:MARK:MODE POS` `:CALC:SPUR:MARK:MODE?`
Preset	`OFF`
State Saved	Saved in instrument state
Range	`POSition|DELTa|OFF`
Annotation	Mkr # <X value> and <Marker value> upper right on graph When Marker Trace is Polar in WCDMA mode: Mkr # <Chip Value (RHO & QPSKEVM)/Symbol Value (CDP)>, <X value> and <Y value> upper right on graph

Backwards Compatibility SCPI Commands

Sets or queries the state of a marker. Setting a marker that is `OFF` to `ON` (1) puts it in `POSition` mode and places it at the center of the screen.

Example	`:CALC:SPUR:MARK3:STAT 1` `:CALC:SPUR:MARK3:STAT?`
Preset	`OFF`
State Saved	Saved in instrument state
Range	`OFF|ON`
Backwards Compatibility SCPI	`:CALCulate:SPURious:MARKer[1]|2|…|12:STATe OFF | ON | 0 | 1` `:CALCulate:SPURious:MARKer[1]|2|…|12:STATe?`

Delta Marker (Reset Delta)

Pressing this control has exactly the same effect as selecting **Delta** in "Marker Mode" on page 1054. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

Marker Settings Diagram

Lets you configure the Marker system using a visual utility.

All Markers Off

Turns off all markers.

Remote Command	`:CALCulate:SPURious:MARKer:AOFF`
Example	`:CALC:SPUR:MARK:AOFF`

Couple Markers

When this function is `ON`, moving any marker causes an equal X-Axis movement of every other marker that is not `OFF`. By "equal X-Axis movement" we mean that we preserve the difference between each marker's X-Axis value (in the fundamental x-axis units of the trace that marker is on), and the X-Axis value of the marker being moved (in the same fundamental X-Axis units).

This may result in markers going off screen.

Remote Command	`:CALCulate:SPURious:MARKer:COUPle[:STATe] ON | OFF | 1 | 0` `:CALCulate:SPURious:MARKer:COUPle[:STATe]?`
Example	`:CALC:SPUR:MARK:COUP ON` `:CALC:SPUR:MARK:COUP?`
Preset	`OFF` Preset by **Mode Preset** and **All Markers Off**
State Saved	Saved in instrument state

3.6.7.3 Peak Search

The controls on this tab allow you to move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with the Delta Marker function.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a peak search.

Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a peak search.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as "Marker Frequency" on page 1053 on the **Settings** tab.

Peak Search

Moves the selected marker to the trace point that has the maximum y-axis value for that marker’s trace.

NOTE Pressing the **Peak Search** hardkey automatically moves you to the Peak Search page of the Marker menu *and* performs a peak search.

Remote Command	`:CALCulate:SPURious:MARKer[1]|2|…|12:MAXimum`

Example	`:CALC:SPUR:MARK2:MAX`
	`:SYST:ERR?`
	can be used to query the errors to determine if a peak is found. The message “No peak found” will be returned after an unsuccessful search

Notes	Sending this command selects the subopcoded marker In W-CDMA Mode, this command does not work when the selected marker is located on the polar trace. In this case, the command is ignored

Next Peak

Moves the selected marker to the peak that is next lower in amplitude than the current marker value.

If the selected marker was `OFF`, then it is turned on as a `POSition` marker and a peak search is performed.

Remote Command	`:CALCulate:SPURious:MARKer[1]|2|…|12:MAXimum:NEXT`
Example	`:CALC:SPUR:MARK2:MAX:NEXT`
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Next Pk Right

Moves the selected marker to the nearest peak right of the current marker.

If the selected marker was `OFF`, then it is turned on as a `POSition` marker and a peak search is performed.

Remote Command	`:CALCulate:SPURious:MARKer[1]|2|…|12:MAXimum:RIGHt`
Example	`:CALC:SPUR:MARK2:MAX:RIGH`
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Next Pk Left

Moves the selected marker to the nearest peak left of the current marker.

If the selected marker was `OFF`, then it is turned on as a `POSition` marker and a peak search is performed.

Remote Command	`:CALCulate:SPURious:MARKer[1]|2|…|12:MAXimum:LEFT`
Example	`:CALC:SPUR:MARK2:MAX:LEFT`
State Saved	Not part of saved state

Minimum Peak

Moves the selected marker to the minimum Y-Axis value on the current trace.

If the selected marker is `OFF`, it is turned `ON` before the minimum search is performed.

Remote Command	`:CALCulate:SPURious:MARKer[1]|2|…|12:MINimum`
Example	`:CALC:SPUR:MARK:MIN`
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Pk-Pk Search

Finds and displays the amplitude and frequency differences between the highest and lowest y-axis value. It places the selected marker on the minimum value on its selected trace, and places that marker's reference marker on the peak of its selected trace.

This function turns on the reference marker and sets its mode to **Fixed** or **Normal** if it is not already on. (These markers may be on two different traces.)

If the selected marker is `OFF`, a **Delta** type marker is turned on and the peak-to-peak search is done. If the selected marker is on, but it is not a **Delta** marker, then it is changed to delta, which turns on the reference marker if needed, and then it performs the peak-to-peak function.

Remote Command	`:CALCulate:SPURious:MARKer[1]|2|…|12:PTPeak`
Example	`:CALC:SPUR:MARK:PTP`
Notes	Turns on the Marker D active function Sending this command selects the subopcoded marker
Dependencies	Pk-Pk Search is not available when **Coupled Markers** is ON
Couplings	The selected marker becomes a **Delta** marker if not already in **Delta** mode
State Saved	Not part of saved state

Marker Delta

Pressing this control has the same effect as selecting **Delta** in "Marker Mode" on page 1054 on the **Settings** tab. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the delta to zero.

The control is duplicated here to allow you to conveniently perform a peak search, and change the marker’s control mode to **Delta**, without having to access two separate menus.

3.6.7.4 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as "Marker Frequency" on page 1053 on the **Settings** tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the “reference marker” for that marker. This attribute is set by the **Marker, Properties, Relative To** control. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote	`:CALCulate:SPURious:MARKer[1]|2|…|12:REFerence <integer>`

Command	`:CALCulate:SPURious:MARKer[1]|2|…|12:REFerence?`
Example	`:CALC:SPUR:MARK3:REF 5` `:CALC:SPUR:MARK:REF?`
Notes	This command causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded the value is clipped A marker cannot be relative to itself, so that choice is not available, and if sent from SCPI generates error -221: "Settings conflict; marker cannot be relative to itself" When queried a single value is returned (the specified marker numbers relative marker)
Couplings	If the reference marker is off it is turned on in **Normal** mode at the delta marker location
Preset	The preset default "Relative To" marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then it's default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by using **Restore Mode Defaults**. This is not reset by **Marker Off**, **All Markers Off**, or **Preset**
State Saved	Saved in instrument state. Not affected by **Markers Off**, hence not affected by Preset or power cycle
Min	1
Max	12
Annunciation	Appears in the marker label of a **Delta** marker

Marker Trace

Selects the trace on which you want your marker placed. A marker is associated with one and only one trace. This trace is used to determine the placement, result, and X-Axis Scale of the marker. All markers have an associated trace; it is from that trace that they determine their attributes and behaviors, and it is to that trace that they go when they become **Normal** markers.

Specifying a **Marker Trace** manually or with this command associates the marker with the specified trace. If the marker is not `OFF`, it moves the marker from the trace it was on to the new trace. If the marker is `OFF`, it stays off but is now associated with the specified trace.

The query returns the number of the trace on which the marker is currently placed.

Remote Command	`:CALCulate:SPURious:MARKer[1]|2|…|12:TRACe:ATTached TRACe1 | TRACe2 | TRACe3` `:CALCulate:SPURious:MARKer[1]|2|…|12:TRACe:ATTached?`
Example	`:CALC:SPUR:MARK2:TRAC:ATT TRAC2` `:CALC:SPUR:MARK2:TRAC:ATT?`
Notes	A marker may be placed on a blanked and/or inactive trace, even though the trace is not visible and/or updating An application may register a trace name to be displayed on the control instead of a trace number
Couplings	The state of **Marker Trace** is not affected by "Auto Couple" on page 2242

	Sending the remote command causes the addressed marker to become selected
Preset	`TRACe1`
State Saved	Saved in instrument state
Range	`TRACe1|TRACe2|TRACe3`

Marker Settings Diagram

Lets you configure the **Marker** system using a visual utility. It is the same as "Marker Settings Diagram" on page 1055 under **Settings**.

3.6.8 Meas Setup

Contains functions for setting up the measurement parameters, and for setting up parameters global to all measurements in the Mode.

3.6.8.1 Settings

Contains frequently-used **Meas Setup** functions, to which you will want the fastest access.

Avg/Hold Num

Specifies the number of measurement averages used to calculate the measurement result. The average is displayed at the end of each sweep.

Remote Command	`[:SENSe]:SPURious:AVERage:COUNt <integer>` `[:SENSe]:SPURious:AVERage:COUNt?`
Example	`:SPUR:AVER:COUN 2500` `:SPUR:AVER:COUN?`
Preset	10
State Saved	Saved in instrument state
Min/Max	1/10000

Averaging On/Off

Turns Averaging on or off.

NOTE In this measurement, the **Average Type** is preset to the `Log-Pwr Avg (Video)` method. Other averaging methods are not available.

Remote Command	`[:SENSe]:SPURious:AVERage[:STATe] ON | OFF | 1 | 0` `[:SENSe]:SPURious:AVERage[:STATe]?`
Example	`:SPUR:AVER ON` `:SPUR:AVER?`
Preset	`OFF`
State Saved	Saved in instrument state
Range	`ON|OFF`

Average Mode

Lets you set the Averaging Mode. Options are:

- `EXPonential`: The measurement averaging continues using the specified number of averages to compute each averaged value. The average will be displayed at the end of each sweep
- `REPeat`: The measurement resets the average counter each time the specified number of averages is reached

Remote Command	`[:SENSe]:SPURious:AVERage:TCONtrol EXPonential | REPeat` `[:SENSe]:SPURious:AVERage:TCONtrol?`
Example	`:SPUR:AVER:TCON REP` `:SPUR:AVER:TCON?`
Preset	`EXPonential`
State Saved	Saved in instrument state
Range	`EXPonential|REPeat`

Average Type

Enables you to control the way averaging is done by choosing one of the following averaging scales: Log-Power (Video) or Power (RMS).

There are three different averaging processes in the measurement, and all of them are affected by this setting: Trace Averaging, the Average detector, and VBW filtering.

Control Selection	SCPI	Type
Log-Pwr (Video)	`LOG`	Simulates the traditional spectrum analyzer type of averaging by averaging the log of the power
Power (RMS)	`RMS`	True power averaging that is equivalent to taking the RMS value of the voltage. This is the most accurate type of averaging

Remote Command	`[:SENSe]:SPURious:AVERage:TYPE LOG | RMS` `[:SENSe]:SPURious:AVERage:TYPE?`
Example	`:SPUR:AVER:TYPE LOG` `:SPUR:AVER:TYPE?`
Couplings	Sending this command will affect the VBW Average Type
Preset	`LOG`
State Saved	Yes
Range	Log-Pwr (Video) |Power (RMS)

Meas Type

Selects either `EXAMine` or `FULL` measurement type. This parameter is coupled to "Average Mode" on page 1062. Therefore, if the `EXAMine` measurement type is selected, the measurement sets the Average Mode to exponential. If the `FULL` measurement type is selected, the measurement sets the Average Mode to repeat. The behavior of each measurement type is described in the table below. When averaging is on, trace averaging is used as each active range is measured. Averaging is not used at any other time.

Type	Single		Continuous	
	No Spurs Found	Spurs Found	No Spurs Found	Spurs Found
`EXAMine`	All active ranges are measured. On completion the measurement is set to the idle state and the 'No Spurs' happening is displayed	All active ranges are measured, and the spurs found reported. On completion the measurement is set to the idle state and the trace containing the worst spur restored. The spur control is enabled. A marker is also added which is set to the frequency of the worst spur	All active ranges are measured. On completion the SA remains set to last range checked with an active trace and the 'No Spurs' happening is displayed	All active ranges are measured, and the spurs found reported. On completion the SA is set to the range containing the worst spur found and continually sweeps this range. Note that the trace is continually updated but the metrics results aren't updated until restart to keep the initial results as references. Use

Type	Single No Spurs Found	Spurs Found	Continuous No Spurs Found	Spurs Found
				marker readouts to refer the latest results. The spur control is enabled. A marker is also added which is set to the frequency of the worst spur
`FULL`	All active ranges are measured. On completion measurement is set to idle state and the 'No Spurs' happening is displayed	All active ranges are measured, and spurs found reported. On completion the measurement is set to the idle state, displaying the trace of the last active range	Measurement continually cycles through all active ranges	All active ranges are measured, and spurs found reported. On each cycle of the active ranges the spurs found are reset. This ensures any remote queries retrieve the trace data that matches the currently displayed results

Remote Command	`[:SENSe]:SPURious:TYPE EXAMine | FULL` `[:SENSe]:SPURious:TYPE?`
Example	`:SPUR:TYPE FULL` `:SPUR:TYPE?`
Preset	`EXAMine`
State Saved	Saved in instrument state
Range	`EXAMine|FULL`

Spur

Displays any spurs found. Only enabled when the measurement type is set to `EXAMine`, and turns on upon completion of a measurement. Once the **Spur** control has been enabled, you can view any spur. The measurement sets the instrument to the range in which the currently selected spur was found. The range settings only change if the spur selected is in a range that is different from the current range settings. A marker is used to identify the currently selected spur on the trace.

Remote Command	`[:SENSe]:SPURious:SPUR <integer>` `[:SENSe]:SPURious:SPUR?`
Example	`:SPUR:SPUR 55` `:SPUR:SPUR?`
Preset	1
State Saved	No
Min/Max	1/200

Range

Selects the sweep range of the display trace. **Marker** operation, such as peak search is performed in the selected range.

For more details, see "Range Settings" on page 1066.

Preset	1
State Saved	No
Min/Max	1/20

Spur Report Mode

Selects the spurious report mode. Options are:

Limit Line Test	`LIMTest`	Report only spurs above the limit line. Any spurs reported will cause the measurement to fail. See Abs Start Limit for more information
All Spurs	`ALL`	Report all spurs detected by Peak Threshold and Peak Excursion
Minimum Margin	`MMARgin`	Report only the spur with the minimum margin from the limit line. For the spur above the limit, its margin is defined as the negative margin. If there are more than one spurs above the limit, only one spur with the largest negative margin is reported

Remote Command	`[:SENSe]:SPURious:REPT:MODE ALL | LIMTest | MMARgin` `[:SENSe]:SPURious:REPT:MODE?`
Example	`:SPUR:REPT:MODE LIMT` `:SPUR:REPT:MODE?`
Dependencies	`MMARgin` is available only when option N9060A-7FP is installed
Preset	`ALL`

State Saved	Saved in instrument state
Range	All Spurs | Limit Test | Minimum Margin

Apply Carrier Config to Range Table

Sets offset and limit parameters under Range Table. The range frequency and limit values are determined by the carrier configuration parameters and Band Category.

Remote Command	`[:SENSe]:SPURious:MCONdition:IMMediate`
Example	`:SPUR:MCON:IMM`
Dependencies	Only appears in the LTE-A FDD/TDD mode In 5G NR, this control is not supported

Range Settings

This dialog enables you to set range parameters. As you change values, the instrument settings are updated with the new parameter values.

In SA Mode, and most other Modes, each **Range** is defined by its Start Freq and Stop Freq. The index tabs that appear on the left side of this dialog let you change different sets of **Range** parameters; the **Ranges** themselves (Start Freq and Stop Freq) are the same in each of these tabs. In some measurements, **Center Frequency** and **Span** are also shown, but these depend on the Start Freq and Stop Freq parameters for each **Range**.

In MSR Mode, each **Range** is defined by the parameters under the **Frequency** Index tab. The parameters for each **Range** are defined using the other index tabs, tied to the **Frequency** tab by the **Range** number, which appears in the leftmost column of each table.

Each **Range** has an **Enabled** checkbox, which lets you decide whether to use the **Range** or not. The checkbox state is the same for all tabs.

Bandwidth

Lets you set RBW and VBW parameters for each range, as well as Filter Type. The **Bandwidth** tab appears in all Modes except MSR.

Frequency Range

Allows you to switch the displayed **Frequency Range** columns. When `ALL` is selected, Start Frequency, Stop Frequency, Center Frequency, and Span are displayed.

This control appears only in instruments with a 4U size front panel.

<table>

<tr><td>State Saved</td><td>Saved in instrument state</td></tr>
<tr><td>Range</td><td>All | Start/Stop Frequency | Center Frequency/Span</td></tr>
</table>

Enabled

Turns on/off each Range. If Range is `ON`, it will be used as part of the measurement. If it is `OFF`, it will be excluded. This parameter can send up to 20 values. The location in the list sent corresponds to the range number. When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6 you must send all values up to 6. Subsequent values will remain as they were.

The query always returns 20 values.

Span

Sets the span of the instrument. This parameter can send up to 20 values. The location where the span occurs in the list sent to the measurement corresponds to the range the value is associated with.

When sending the remote command, missing values are not permitted. If you want to change values 2 and 6, then you must send all values up to 6. Subsequent values will remain as they were.

The query always returns 20 values.

Remote Command	`[:SENSe]:SPURious[:RANGe][:LIST]:FREQuency:SPAN <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>` `[:SENSe]:SPURious[:RANGe][:LIST]:FREQuency:SPAN?`
Example	`:SPUR:FREQ:SPAN 9 kHz, 150 kHz, 30 MHz, 1GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz` `:SPUR:FREQ:SPAN?`
Preset	(Preset of Stop Freq) - (Preset of Start Freq)
State Saved	No
Min/Max	0Hz/Instrument maximum frequency + 80MHz

Res BW

Sets the resolution bandwidth of the instrument. This parameter can send up to 20 values.

The location of where the resolution bandwidth occurs in the list sent to the measurement corresponds to the range the value is associated with.

When sending the remote command, missing values are not permitted. In other words, if you want to change values 2 and 6, then you must send all values up to 6. Subsequent values will remain as they were.

The query always returns 20 values.

Remote Command	`[:SENSe]:SPURious[:RANGe][:LIST]:BANDwidth[:RESolution] <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>` `[:SENSe]:SPURious[:RANGe][:LIST]:BANDwidth[:RESolution]?`

Example	`:SPUR:BAND 1kHz, 10kHz, 100kHz, 1MHz, 1MHz, 1MHz, 1MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz` `:SPUR:BAND?`	
Preset	SA Mode	1.2MHz, 0.51MHz, 0.1MHz, 0.1MHz, 4MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz
	WCDMA Mode	1kHz, 10kHz, 100kHz, 1MHz, 1MHz, 1MHz, 1MHz, 1MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz
	LTETDD, LTEATDD, 5G NR Modes	1kHz, 10kHz, 100kHz, 1MHz, 1MHz, 1MHz, 1MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz
	LTE, LTEAFDD Modes	1kHz, 10kHz, 100kHz, 1MHz, 100kHz, 1MHz, 1MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz
	WLAN Mode	1kHz, 10kHz, 100kHz, 1MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz, 3MHz

Meas BW

Allows you to specify a multiplier of Res BW for the measurement integration bandwidth.

Meas BW is multiplier integer number. It shows a ratio between Integration BW and Resolution BW of the measurement result:

Integ BW = **Meas BW** * Resolution BW

Integration BW is desired resolution bandwidth and Resolution BW is actual bandwidth for sweep. Measurement sweeps with Resolution BW and **Meas BW** compensates sweep resolution bandwidth to Integration BW.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, you must send all values up to 6. Subsequent values will remain as they were. The query always returns 20 values.

Remote Command	`[:SENSe]:SPURious[:RANGe][:LIST]:BANDwidth:IMULti <integer>, …` `[:SENSe]:SPURious[:RANGe][:LIST]:BANDwidth:IMULti?`
Example	`:SPUR:BAND:IMUL 1,1,1,1,1,1` `:SPUR:BAND:IMUL?`
Notes	Comma-separated list of values
Preset	`1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1`
State Saved	Yes
Max	1000
Min/Max	1
Backwards Compatibility SCPI	`[:SENSe]:SPURious[:RANGe][:LIST]:BWIDth:IMULti`

Video BW

Sets the **Video BW** mode of the instrument. This can be Auto, where the instrument determines the optimum setting, or Manual, where you determine the setting. This parameter can send up to 20 values. The location in the list sent corresponds to the range the value is associated with. When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, then you must send all values up to 6. Subsequent values will remain as they were.

The query always returns 20 values.

Remote Command	`[:SENSe]:SPURious[:RANGe][:LIST]:BANDwidth:VIDeo <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>` `[:SENSe]:SPURious[:RANGe][:LIST]:BANDwidth:VIDeo?`

Backwards Compatibility SCPI	`[:SENSe]:SPURious[:RANGe][:LIST]:BWIDth:VIDeo:AUTO`

Filter Type

In addition to the Gaussian filter shape, there are certain special filter types, such as Flat Top, which are desirable under certain conditions. The **Filter Type** menu gives you control over these parameters.

Remote Command	`[:SENSe]:SPURious[:RANGe][:LIST]:BANDwidth:SHAPe GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop` `[:SENSe]:SPURious[:RANGe][:LIST]:BANDwidth:SHAPe?`
Example	`:SPUR:BAND:SHAP GAUS, GAUS, GAUS, GAUS, GAUS, GAUS, FLAT, FLAT, FLAT, FLAT, FLAT, GAUS, GAUS, GAUS, GAUS, GAUS, FLAT, FLAT, GAUS, GAUS` `:SPUR:BAND:SHAP?`
Preset	`GAUS, GAUS, GAUS, GAUS, GAUS, GAUS, GAUS, GAUS, GAUS, GAUS, GAUS, GAUS, GAUS, GAUS, GAUS, GAUS, GAUS, GAUS, GAUS, GAUS`
State Saved	Saved in instrument state
Range	Gaussian (Normal)|Flattop
Backwards Compatibility SCPI	`[:SENSe]:SPURious[:RANGe][:LIST]:BWIDth:SHAPe`

Enabled

Same as the **Enabled** checkbox under the **Bandwidth** tab. See"Enabled" on page 1067

Frequency Type

Selects the frequency type as either `ABSolute` or `OFFSet`:

`ABSolute`	The frequency range is determined by Abs Start Freq and Abs Stop Freq. Absolute and offset frequencies are not coupled
`OFFSet`	The frequency range is determined based on Offset Start Freq and Offset Stop Freq. Abs Start Freq and Abs Stop Freq are coupled with the offset parameters and show the actual frequency ranges. The following coupling equations are used to calculate Abs Start Freq and Abs Stop Freq

When Offset Side is Negative:

[Abs Start Freq] = [OB Start Freq] – [Offset Stop Freq]

[Abs Stop Freq] = [OB Start Freq] – [Offset Start Freq]

When Offset Side is Positive:

[Abs Start Freq] = [OB Stop Freq] + [Offset Start Freq]

[Abs Stop Freq] = [OB Stop Freq] + [Offset Stop Freq]

When changing OB Start/Stop Freq, Abs Start/Stop Freq is changed and Offset Start/Stop Freq remains unchanged.

When changing Offset Start/Stop Freq, Abs Start/Stop Freq is changed and OB Start/Stop Freq remains unchanged.

Remote Command	`[:SENSe]:SPURious[:RANGe][:LIST]:FREQuency:TYPE ABSolute | OFFSet, ABSolute | OFFSet, ABSolute | OFFSet, ABSolute | OFFSet, ABSolute | OFFSet, ABSolute | OFFSet, ABSolute | OFFSet, ABSolute | OFFSet, ABSolute | OFFSet, ABSolute | OFFSet, ABSolute | OFFSet, ABSolute | OFFSet, ABSolute | OFFSet, ABSolute | OFFSet, ABSolute | OFFSet, ABSolute | OFFSet, ABSolute | OFFSet, ABSolute | OFFSet, ABSolute | OFFSet, ABSolute | OFFSet` `[:SENSe]:SPURious[:RANGe][:LIST]:FREQuency:TYPE?`
Example	`:SPUR:FREQ:TYPE OFFS, OFFS, ABS, ABS, ABS` `:SPUR:FREQ:TYPE?`
Couplings	Freq Type automatically changes to `OFFSet` when you change a value of Offset Start Freq, Offset Stop Freq or Offset Side, and automatically changes to `ABSolute` when you change a value of Abs Start Freq or Abs Stop Freq
Preset	`ABSolute, ABSolute, ABSolute, ABSolute, ABSolute, ABSolute, ABSolute, ABSolute, ABSolute, ABSolute, ABSolute, ABSolute, ABSolute, ABSolute, ABSolute, ABSolute, ABSolute, ABSolute, ABSolute, ABSolute`
State Saved	Saved in instrument state
Range	`ABSolute|OFFSet`

Abs Start Freq

Sets the start frequency of the instrument. This parameter can send up to 20 values. The location where the start frequency occurs in the list sent to the measurement corresponds to the range the value is associated with.

This parameter is coupled with either Offset Start Freq or Offset Stop Freq. The coupling equations are shown in "Enabled" on page 1074.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6 you must send all values up to 6. Subsequent values will remain as they were.

The query always returns 20 values.

Remote Command	`[:SENSe]:SPURious[:RANGe][:LIST]:FREQuency:STARt <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>` `[:SENSe]:SPURious[:RANGe][:LIST]:FREQuency:STARt?`
Example	`:SPUR:FREQ:STAR 9 kHz, 150 kHz, 30 MHz, 1GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz` `:SPUR:FREQ:STAR?`
Preset	9 kHz, 150 kHz, 30 MHz, 1 GHz, 1.92GHz, 1.98 GHz, 2.18 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz
State Saved	Saved in instrument state
Min/Max	-80 MHz/Hardware Dependent – Option 503: 3699999990 – Option 508: 8499999990 – Option 513: 13799999990 – Option 526: 26999999990

Abs Stop Freq

Sets the stop frequency of the instrument. This parameter can send up to 20 values. The location in the list sent corresponds to the range the value is associated with.

This parameter is coupled with either "Offset Start Freq" on page 1077 or "Offset Stop Freq" on page 1078. The coupling equations are shown in "Enabled" on page 1074.

The location of where the stop frequency occurs in the list sent to the measurement corresponds to the range the value is associated with.

When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6 you must send all values up to 6. Subsequent values will remain as they were.

The query always returns 20 values.

Remote Command	`[:SENSe]:SPURious[:RANGe][:LIST]:FREQuency:STOP <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>` `[:SENSe]:SPURious[:RANGe][:LIST]:FREQuency:STOP?`
Example	`:SPUR:FREQ:STOP 150kHz, 30MHz, 1GHz, 2.1GHz, 2.1GHz, 2.1774GHz, 2.18GHz, 12.75GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz` `:SPUR:FREQ:STOP?`
Preset	150kHz, 30MHz, 1GHz, 1.92GHz, 1.98GHz, 2.1GHz, 12.75GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz
State Saved	Yes
Min/Max	-79999990/Hardware Dependent: – Option 503: 3.7 GHz – Option 508: 8.5 GHz – Option 513: 13.8 GHz – Option 526: 27.0 GHz

Offset Start Freq

Sets the range frequency as offset from one of the operating band edges. This parameter can send up to 20 values. The location where the start frequency occurs in the list sent to the measurement corresponds to the range the value is associated with. When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6 you must send all values up to 6. Subsequent values will remain as they were.

The query always returns 20 values.

This parameter is coupled with either "Abs Start Freq" on page 1076 or "Abs Stop Freq" on page 1076 using the coupling equations shown in "Enabled" on page 1074.

This value is clipped to keep Abs Start/Stop Freq within the available frequency range. This clipping applies even when OB Start Freq, OB Stop Freq or Offset Side is changed.

Remote Command	`[:SENSe]:SPURious[:RANGe][:LIST]:OFFSet:FREQuency:STARt <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>` `[:SENSe]:SPURious[:RANGe][:LIST]:OFFSet:FREQuency:STARt?`

Example	`:SPUR:OFFS:FREQ:STAR 9 kHz, 150 kHz, 30 MHz, 1GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz,1.5 GHz,1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz` `:SPUR:OFFS:FREQ:STAR?`
Preset	10 MHz, 20 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz
State Saved	Saved in instrument state
Min/Max	-80 MHz/SA Max Freq - 10Hz (Hardware Dependent)

Offset Stop Freq

Sets the range frequency as offset from one of operating band edges. This parameter can send up to 20 values. The location in the list sent corresponds to the range the value is associated with.

The location of where the stop frequency occurs in the list sent to the measurement corresponds to the range the value is associated with.

When sending the remote command, missing values are not permitted. If you want to change values 2 and 6, then you must send all values up to 6. Subsequent values will remain as they were. The query always returns 20 values.

This parameter is coupled with either "Abs Start Freq" on page 1076 or "Abs Stop Freq" on page 1076 using the coupling equations shown in "Enabled" on page 1074.

This value is clipped to keep Abs Start/Stop Freq inside the available frequency range. This clipping applies even when OB Start Freq, OB Stop Freq or Offset Side is changed.

Remote Command	`[:SENSe]:SPURious[:RANGe][:LIST]:OFFSet:FREQuency:STOP <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>` `[:SENSe]:SPURious[:RANGe][:LIST]:OFFSet:FREQuency:STOP?`
Example	`:SPUR:OFFS:FREQ:STOP 150kHz, 30MHz, 1GHz, 2.1GHz, 2.1GHz, 2.1774GHz, 2.18GHz, 12.75GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz, 2.5GHz` `:SPUR:OFFS:FREQ:STOP?`
Preset	20 MHz,30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz, 30 MHz
State Saved	Yes
Min/Max	-79999990/SA Max Frequency (Hardware Dependent)

Offset Side

Sets the offset side to either Negative or Positive. This parameter indicates which side of the operation band the specified range is on. It also determines which coupling equations defined in Frequency Type section are used to couple the absolute frequencies and the offset frequencies. This setting is effective only when "Frequency Type" on page 1075 is `OFFset`.

Remote Command	`[:SENSe]:SPURious[:RANGe][:LIST]:OFFSet:SIDE NEGative | POSitive, NEGative | POSitive, NEGative | POSitive, NEGative | POSitive, NEGative | POSitive, NEGative | POSitive, NEGative | POSitive, NEGative | POSitive, NEGative | POSitive, NEGative | POSitive, NEGative | POSitive, NEGative | POSitive, NEGative | POSitive, NEGative | POSitive, NEGative | POSitive, NEGative | POSitive, NEGative | POSitive, NEGative | POSitive, NEGative | POSitive, NEGative | POSitive` `[:SENSe]:SPURious[:RANGe][:LIST]:OFFSet:SIDE?`
Example	`:SPUR:OFFS:SIDE NEG, NEG, POS, POS` `:SPUR:OFFS:SIDE?`
Preset	`NEG, NEG, POS, POS, POS, POS, POS, POS, POS, POS, POS, POS, POS, POS, POS, POS, POS, POS, POS, POS`
State Saved	Saved in instrument state
Range	Negative (From Op. Band Start Edge)|Positive (From Op. Band Stop Edge)

Filter/Atten

Lets you set Attenuation and IF Gain values for each Range. This tab appears in all Modes except MSR.

Frequency Range

Allows you to switch the displayed **Frequency Range** columns. When `ALL` is selected, Start Frequency, Stop Frequency, Center Frequency, and Span are displayed.

This control appears only in instruments with a 4U size front panel.

Remote Command	`:DISPlay:SPURious:VIEW:RANGe:TABLe:FMODe ALL | SSTop | CSPan` `:DISPlay:SPURious:VIEW:RANGe:TABLe:FMODe?`
Example	`:DISP:SPUR:VIEW:RANG:TABL:FMOD ALL` `:DISP:SPUR:VIEW:RANG:TABL:FMOD?`
Preset	`SSTop`
State Saved	Saved in instrument state
Range	All | Start/Stop Frequency | Center Frequency/Span

Enabled

Same as Enabled under the **Bandwidth** index tab. See"Enabled" on page 1067.

Start Freq

Same as the Start Freq column under the **Bandwidth** index tab. See"Start Freq" on page 1068.

Stop Freq

Same as the Stop Freq column under the **Bandwidth** index tab. See"Stop Freq" on page 1069.

Center Frequency

Sets the center frequency of the instrument. This parameter can send up to 20 values. The location where the center frequency occurs in the list sent to the measurement corresponds to the range the value is associated with.

When sending the remote command, missing values are not permitted. If you want to change values 2 and 6 you must send all values up to 6. Subsequent values will remain as they were.

The query always returns 20 values.

Remote Command	`[:SENSe]:SPURious[:RANGe][:LIST]:FREQuency:CENTer <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>, <freq>` `[:SENSe]:SPURious[:RANGe][:LIST]:FREQuency:CENTer?`
Example	`:SPUR:FREQ:CENT 9 kHz, 150 kHz, 30 MHz, 1GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz, 1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz,1.5 GHz` `:SPUR:FREQ:CENT?`
Preset	(Preset of Start Freq + Preset of Stop Freq)/2
State Saved	No
Min/Max	-79.999995 MHz/ Instrument maximum frequency – 5 Hz

Span

Same as the Span column under the **Bandwidth** index tab. See "Span" on page 1070.

Attenuation

Defines attenuation value for each range:

`ON`	The Attenuation value under AMPTD Y Scale is used
`OFF`	This value is used as mechanical attenuation value without electric attenuation

Remote Command	`[:SENSe]:SPURious[:RANGe][:LIST]:ATTenuation <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>` `[:SENSe]:SPURious[:RANGe][:LIST]:ATTenuation?`
Example	`:SPUR:ATT 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB` `:SPUR:ATT?`
Couplings	"---" is displayed as value when Auto state is ON, to indicate attenuation value under AMPTD Y Scale is being used
Preset	10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB, 10dB
State Saved	Saved in instrument state
Min/Max	0 dB/70 dB

</table>

IF Gain

Sets **IF Gain** to: **Auto**, **On** (the extra 10 dB) or **Off**. These settings affect sensitivity and IF overloads. A switched IF amplifier with approximately 10 dB of gain is available. This amplifier takes full advantage of the RF dynamic range of the instrument. When it can be turned on without an overload, the dynamic range is always better with the amplifier on than off.

Dependencies	The IF Gain controls (FFT IF Gain and Swept IF Gain) have no effect when the U7227A USB Preamplifier is connected. This is not annotated or reflected on any control; there are no controls grayed out nor any SCPI locked out. The instrument simply behaves as though both FFT IF Gain and Swept IF Gain are set to Low regardless of the setting on the controls

IF Gain Auto

Activates the rules for auto IF Gain.

Remote Command	`[:SENSe]:SPURious:IF:GAIN:AUTO[:STATe] OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1` `[:SENSe]:SPURious:IF:GAIN:AUTO[:STATe]?`
Example	`:SPUR:IF:GAIN:AUTO ON,ON` `:SPUR:IF:GAIN:AUTO?`
Couplings	When the sweep type is Swept, 'Auto' sets IF Gain to High Gain under any of the following conditions: the input attenuator is set to 0 dB, the preamp is turned on, or the Max Mixer Level is –20 dBm or lower. For other settings using the swept sweep type, auto sets IF Gain to Low Gain
Preset	`OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF`
State Saved	Saved in instrument state

IF Gain State

Selects the range of IF Gain.

Remote Command	`[:SENSe]:SPURious:IF:GAIN[:STATe] OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1` `[:SENSe]:SPURious:IF:GAIN[:STATe]?`
Example	`:SPUR:IF:GAIN ON,ON` `:SPUR:IF:GAIN?`
Preset	`OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF`

Min/Max	0 dB/70 dB

Auto Function

Remote Command	`[:SENSe]:SPURious[:RANGe][:LIST]:ATTenuation:AUTO OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1` `[:SENSe]:SPURious[:RANGe][:LIST]:ATTenuation:AUTO?`
Example	`:SPUR:ATT:AUTO 0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0` `:SPUR:ATT:AUTO?`
Preset	`ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON`
State Saved	Saved in instrument state
Range	Auto | Man

IF Gain

Same as the IF Gain column under the **Atten** tab. See"IF Gain" on page 1081.

Detector/Sweep

Lets you set Sweep, IF Gain, and Detector parameters for each Range.

Frequency Range

Allows you to switch the displayed **Frequency Range** columns. When `ALL` is selected, Start Frequency, Stop Frequency, Center Frequency, and Span are displayed.

This control appears only in instruments with a 4U size front panel.

Remote Command	`:DISPlay:SPURious:VIEW:RANGe:TABLe:FMODe ALL | SSTop | CSPan` `:DISPlay:SPURious:VIEW:RANGe:TABLe:FMODe?`
Example	`:DISP:SPUR:VIEW:RANG:TABL:FMOD ALL` `:DISP:SPUR:VIEW:RANG:TABL:FMOD?`
Preset	`SSTop`
State Saved	Saved in instrument state
Range	All | Start/Stop Frequency | Center Frequency/Span

Enabled

Same as the **Enabled** checkbox under the **Bandwidth** tab. See"Enabled" on page 1067.

Start Freq

Same as the Start Freq column under the **Bandwidth** tab. See"Start Freq" on page 1068. This column does not appear in MSR mode.

Stop Freq

Same as the Stop Freq column under the **Bandwidth** tab. See"Stop Freq" on page 1069. This column does not appear in MSR mode.

Center Frequency

Same as the Center column under the **Bandwidth** index tab. See"Center Frequency" on page 1080.

Span

Same as the Span column under the **Bandwidth** tab. See "Span" on page 1070. This column does not appear in MSR mode.

Sweep Time

Sets the **Sweep Time** mode of the instrument. This can be **Auto**, where the instrument determines the optimum setting, or **Manual**, where you determine the setting.

This parameter can send up to 20 values. The location in the list sent corresponds to the range of the associated value. When sending the remote command, missing values are not permitted. If you want to change values 2 and 6, then you must send all values up to 6. Subsequent values will remain as they were.

The query always returns 20 values.

Remote Command	`[:SENSe]:SPURious[:RANGe][:LIST]:SWEep:TIME <time>, <time>, <time>, <time>, <time>, <time>, <time>, <time>, <time>, <time>, <time>, <time>, <time>, <time>, <time>, <time>, <time>, <time>, <time>, <time>` `[:SENSe]:SPURious[:RANGe][:LIST]:SWEep:TIME?`
Example	`:SPUR:SWE:TIME 10,10,10,10,10,10,10,10,10,10,10,10,10,10,10,10,10,10,10,10` `:SPUR:SWE:TIME?`
Preset	Automatically calculated
State Saved	Saved in instrument state
Min/Max	1.0E-3/2.0E+3

Auto Function

Remote Command	`[:SENSe]:SPURious[:RANGe][:LIST]:SWEep:TIME:AUTO OFF | ON | 0 | 1,OFF | ON | 0 | 1,OFF | ON | 0 | 1,OFF | ON | 0 | 1,OFF | ON | 0 | 1,OFF | ON | 0 | 1,OFF | ON | 0 | 1,OFF | ON | 0 | 1,OFF | ON | 0 | 1,OFF | ON | 0 | 1,OFF | ON | 0 | 1,OFF | ON | 0 | 1,OFF | ON | 0 | 1,OFF | ON | 0 | 1,OFF | ON | 0 | 1,OFF | ON | 0 | 1,OFF | ON | 0 | 1,OFF | ON | 0 | 1,OFF | ON | 0 | 1,OFF | ON | 0 | 1` `[:SENSe]:SPURious[:RANGe][:LIST]:SWEep:TIME:AUTO?`
Example	`:SPUR:SWE:TIME:AUTO ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON,ON` `:SPUR:SWE:TIME:AUTO?`
Preset	`ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON, ON`
State Saved	Saved in instrument state
Range	`OFF|ON`

Points

Sets the number of points per sweep for the measurement. This parameter can send up to 20 values. The location in the list sent corresponds to the range of the associated value. When sending the remote command, missing values are not permitted. If you want to change values 2 and 6, then you must send all values up to 6. Subsequent values will remain as they were. The query always returns 20 values.

The Points mode can be manual, where you determine the setting or auto, where the instrument determines the number of trace points to ensure the sweep points resolution equals RBW/2. This is calculated using the following algorithm:

Points = (Stop Freq – Start Freq) / (ResBW / 2) with the computed values being clipped to a minimum of 601 and a maximum of 20001.

	`:SPUR:DET2?`
Notes	For backward compatibility, "`NORMal`" is available as a SCPI command parameter. However, this is treated same as "`RMS`" internally, so the query never returns "`NORMal`" as its results
Preset	`OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF, OFF`
State Saved	Saved in instrument state
Range	Off | Normal | Average | Peak | Sample | Negative Peak

Limits

Lets you set Start and Stop Limits and Threshold values for each Range.

Frequency Range

Same as **Frequency Range** under the **Bandwidth** tab. See "Frequency Range" on page 1085. This control does not appear in MSR mode.

Enabled

Same as the **Enabled** checkbox under the **Bandwidth** tab. See"Enabled" on page 1067.

Start Freq

Same as the Start Freq column under the **Bandwidth** tab. See"Start Freq" on page 1068. This column does not appear in MSR.

Stop Freq

Same as the Stop Freq column under the **Bandwidth** tab. See"Stop Freq" on page 1069. This column does not appear in MSR.

Center Frequency

Same as the Center column under the **Bandwidth** tab. See"Center Frequency" on page 1080. This column does not appear in MSR mode.

Span

Same as the Span column under the **Bandwidth** tab. See "Span" on page 1070. This column does not appear in MSR mode.

Abs Start Limit

Determines the limit above which spurs will report a failing. If Abs Stop Limit Mode is set to **Auto**, this is coupled to **Abs Stop Limit** to make a flat limit line. If set to **Man**, Abs Start Limit and Abs Stop Limit can take different values to make a sloped limit line.

If the Limit Line Test parameter is off, then any spurs that are found to be above the current 'Peak Excursion' are added to the results table. From these spurs, the amplitude is checked using the abs limit start and abs limit stop parameters, then the limit is calculated. An 'F' is appended to the amplitude value of the spur if the measured amplitude is above the limit. If the Limit Line Test is on, only the spurs whose amplitudes exceed the limit are reported.

This parameter can send up to 20 values. The location in the list sent corresponds to the range of the associated value. When sending the remote command, missing values are not permitted. If you want to change values 2 and 6, then you must send all values up to 6. Subsequent values will remain as they were.

The query always returns 20 values.

Remote Command	`:CALCulate:SPURious[:RANGe][:LIST]:LIMit:ABSolute[:UPPer]:DATA[:STARt] <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>` `:CALCulate:SPURious[:RANGe][:LIST]:LIMit:ABSolute[:UPPer]:DATA[:STARt]?`
Example	`:CALC:SPUR:LIM:ABS:DATA 0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0` `:CALC:SPUR:LIM:ABS:DATA?`
Preset	SA Mode: -5.00000000E+001, -5.00000000E+001, -5.00000000E+001, -5.00000000E+001, -5.00000000E+001, -5.00000000E+001, -5.00000000E+001, -5.00000000E+001, -5.00000000E+001, -5.00000000E+001, -5.00000000E+001, -5.00000000E+001, -5.00000000E+001, -5.00000000E+001, -5.00000000E+001, -5.00000000E+001, -5.00000000E+001, -5.00000000E+001, -5.00000000E+001, -5.00000000E+001 WCDMA Mode: -36dBm, -36dBm, -36dBm, -30dBm, -25dBm, -15dBm, -25dBm, -30dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm LTE, LTEAFDD, MSR Modes: -36dBm, -36dBm, -36dBm, -30dBm, -96dBm, -30dBm, -30dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm LTETDD, LTEATDD, 5G NR Modes: -36dBm, -36dBm, -36dBm, -30dBm, -30dBm, -30dBm, -30dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm, -50dBm,

State Saved	Saved in instrument state
Min/Max	-200.0 dBm/50.0 dBm

Abs Stop Limit

Determines the limit above which spurs will report a failing. If Abs Stop Limit Mode is set to **Auto**, this is coupled to **Abs Start Limit** to make a flat limit line. If set to **Man**, Abs Start Limit and Abs Stop Limit can take different values to make a sloped limit line.

Abs Stop Limit Mode, when set to Couple, couples Abs Start Limit and Abs Stop Limit to make a flat limit line. If set to Man, Abs Start and Abs Stop can take different values to make a sloped limit line.

This parameter can send up to 20 values. The location in the list sent corresponds to the range of the associated value. When sending the remote command, missing values are not permitted; that is, if you want to change values 2 and 6, then you must send all values up to 6. Subsequent values will remain as they were. The query for this parameter always returns 20 values.

Remote Command	`:CALCulate:SPURious[:RANGe][:LIST]:LIMit:ABSolute[:UPPer]:DATA:STOP <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>, <ampl>` `:CALCulate:SPURious[:RANGe][:LIST]:LIMit:ABSolute[:UPPer]:DATA:STOP?`

Peak Excursion

Sets the minimum amplitude variation of signals that can be identified as peaks. If a value of 6 dB is selected, peaks that rise and fall more than 6 dB above the peak threshold value are identified.

This parameter can send up to 20 values. The location in the list sent corresponds to the range of the associated value. When sending the remote command, missing values are not permitted. If you want to change values 2 and 6 you must send all values up to 6. Subsequent values will remain as they were.

The query for this parameter always returns 20 values.

Remote Command	`[:SENSe]:SPURious[:RANGe][:LIST]:PEAK:EXCursion <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>` `[:SENSe]:SPURious[:RANGe][:LIST]:PEAK:EXCursion?`
Example	`:SPUR:PEAK:EXC 20,20, 20, 20, 20, 20, 20, 20, 20, 20, 20, 20, 20, 20, 20, 20, 20, 20, 20, 20` `:SPUR:PEAK:EXC?`
Preset	+6.00000000E+000, +6.00000000E+000, +6.00000000E+000, +6.00000000E+000, +6.00000000E+000, +6.00000000E+000, +6.00000000E+000, +6.00000000E+000, +6.00000000E+000, +6.00000000E+000, +6.00000000E+000, +6.00000000E+000,

	+6.00000000E+000, +6.00000000E+000, +6.00000000E+000, +6.00000000E+000, +6.00000000E+000, +6.00000000E+000, +6.00000000E+000, +6.00000000E+000
State Saved	Saved in instrument state
Min/Max	0.0 dB/100.0 dB

Pk Threshold

Sets the minimum amplitude of signals that can be identified as peaks. For example, if a value of -90 dBm is selected, only peaks that rise and fall more than the peak excursion value which are above –90 dBm are identified.

This parameter can send up to 20 values. The location in the list sent corresponds to the range of the associated value. When sending the remote command, missing values are not permitted. If you want to change values 2 and 6, then you must send all values up to 6. Subsequent values will remain as they were.

The query always returns 20 values.

Remote Command	`[:SENSe]:SPURious[:RANGe][:LIST]:PEAK:THReshold <real>, <real>, <real>, <real>, <real>, <real>, <real>, <real>, <real>, <real>, <real>, <real>, <real>, <real>, <real>, <real>, <real>, <real>, <real>, <real>` `[:SENSe]:SPURious[:RANGe][:LIST]:PEAK:THReshold?`
Example	`:SPUR:PEAK:THR 0,0,0` `:SPUR:PEAK:THR?`
Preset	-9.00000000E+001, -9.00000000E+001, -9.00000000E+001, -9.00000000E+001, -9.00000000E+001, -9.00000000E+001, -9.00000000E+001, -9.00000000E+001, -9.00000000E+001, -9.00000000E+001, -9.00000000E+001, -9.00000000E+001, -9.00000000E+001 ,-9.00000000E+001 ,-9.00000000E+001, -9.00000000E+001, -9.00000000E+001, -9.00000000E+001, -9.00000000E+001, -9.00000000E+001
State Saved	Saved in instrument state
Min/Max	-200/0

Meas Setup Summary Table

Lets you view and access many of the parameters in the Meas Setup menus on one screen.

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "Measurement-Specific Details" on page 1095 below.

Remote Command	`:COUPle ALL`
Example	`:COUP ALL`
Backwards Compatibility SCPI	`:COUPLE ALL | NONE`
Backwards Compatibility Notes	`:COUP:NONE` puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is *not* recommended for making measurements or new designs

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple***does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all measurement parameters to their default values.

Remote Command	`:CONFigure:SPURious`
Example	`:CONF:SPUR`

Fast Spurious Meas (Remote Command only)

This command is the backward compatibility command for the Fast Spurious Measurement. Since this command is another representation of Spurious Report Mode, it is coupled with that command.

- When set to `ON`, only spurs above the limit line are reported. This is the same as Spurious Report Mode `LIMTest`

- When set to `OFF`, all detected spurs are reported. This is the same as Spurious Report Mode `ALL`

Remote Command	`[:SENSe]:SPURious:FSMeas ON | OFF | 1 | 0` `[:SENSe]:SPURious:FSMeas?`
Example	`:SPUR:FSM ON` `:SPUR:FSM?`
Couplings	If `:SPUR:REPT:MODE` is `ALL`, this parameter is `OFF` If `:SPUR:REPT:MODE` is `LIMTest`, this parameter is `ON`
Preset	`OFF`
State Saved	Saved in instrument state

3.6.8.2 Radio

Contains controls to select link direction.

Direction

Specifies whether the LTE-Advanced signal is an uplink signal or a downlink signal.

The choice of link direction determines the Sync/Format, Chan Profile and Time. Advanced menus all change based on the link direction selected. Also, since downlink and uplink signals use OFDMA and SC-FDMA respectively, the list of trace results available and the default traces presented change based on the link direction parameter.

Remote Command	`[:SENSe]:RADio:STANdard:DIRection DLINk | ULINk` `[:SENSe]:RADio:STANdard:DIRection?`
Example	`:RAD:STAN:DIR DLIN`
Couplings	TDD: Changing direction affects the sync source of periodic trigger source or gate source If Direction is uplink, the sync source is RF burst If Direction is downlink, the sync source is External1 If direction is downlink, the menu Measure PRACH/SRS is disabled and the value is off FDD/TDD: Changing Direction affects many other modulation analysis setup parameters
Preset	DLIN ULIN on E6640A DLIN on E6650A
State Saved	Yes
Range	Downlink|Uplink For E6640A, Direction is restricted to Uplink only, Downlink is not selectable For E6650A, Direction is restricted to Downlink only, Uplink is not selectable

Interfering Signal Present

Sets whether interfering signal for the intermodulation tests exists or not. If exists, limits are not evaluated over the interference signal frequency range specified by the span and the center frequency parameters in ACP, SEM and Spurious Emissions.

Remote Command	`[:SENSe]:RADio:IMODulation:INTerference[:STATe] OFF | ON | 0 | 1` `[:SENSe]:RADio:IMODulation:INTerference[:STATe]?`
Example	`:RAD:IMOD:INT 1` `:RAD:IMOD:INT?`
Preset	OFF
State Saved	Saved in instrument state
Range	Yes|No

Freq Offset from Edge

Sets the center frequency of the interference signal for intermodulation tests. The frequency is set as offset frequency from the BS RF bandwidth edge. Interference Offset Side determines on which side of the BS RF bandwidth the interference signal exists.

Remote Command	`[:SENSe]:RADio:IMODulation:INTerference:FREQuency:OFFSet <freq>` `[:SENSe]:RADio:IMODulation:INTerference:FREQuency:OFFSet?`
Example	`:RAD:IMOD:INT:FREQ:OFFS 5MHz` `:RAD:IMOD:INT:FREQ:OFFS?`
Preset	5MHz
State Saved	Saved in instrument state
Min/Max	0 Hz / 20.0 MHz

Span

Sets the span of the interference signal for intermodulation tests.

Remote Command	`[:SENSe]:RADio:IMODulation:INTerference:SPAN <freq>` `[:SENSe]:RADio:IMODulation:INTerference:SPAN?`
Example	`:RAD:IMOD:INT:SPAN 5MHz` `:RAD:IMOD:INT:SPAN?`
Preset	5 MHz
State Saved	Saved in instrument state
Min/Max	200 kHz / 20.0 MHz

Offset Side

Sets which side of the BS RF bandwidth the interference signal exists on.

Remote Command	`[:SENSe]:RADio:IMODulation:INTerference:SIDE NEGative | POSitive` `[:SENSe]:RADio:IMODulation:INTerference:SIDE?`
Example	`:RAD:IMOD:INT:SIDE POS` `:RAD:IMOD:INT:SIDE?`
Preset	POSitive
State Saved	Saved in instrument state

Non-Contiguous Interference Region

Sets the region the interfering signal exists at in the Non-Contiguous mode:

- INNer – The interfering signal exists at the inner region. This setting is only effective when Carrier Alloc is Non-Contiguous. When in Contiguous, the interference region is always outside regardless of the selection of this parameter
- OUTer – The interfering signal exists at either of the outer regions

Remote Command	`[:SENSe]:RADio:IMODulation:INTerference:REGion INNer | OUTer` `[:SENSe]:RADio:IMODulation:INTerference:REGion?`
Example	`:RAD:IMOD:INT:REG OUT` `:RAD:IMOD:INT:REG?`
Preset	OUTer
State Saved	Saved in instrument state

3.6.8.3 Component Carriers

Contains settings that let you configure the analyzer to match the component carriers in your LTE-A signal.

Number of Component Carriers

Specifies how many component carriers are included in LTE-Advanced TDD/FDD measurements. Each component carrier complies with the LTE specifications.

LTE-Advanced TDD/FDD supports a maximum of five component carriers, so the maximum transmission bandwidth is up to 100 MHz.

Remote Command	`[:SENSe]:CCARrier:COUNt <integer>` `[:SENSe]:CCARrier:COUNt?`
Example	`:CCAR:COUN 1` `:CCAR:COUN?`
Notes	The max number of Component carriers can be set greater than one with 9080B/9082B-2FP license
Preset	1
State Saved	Yes
Min	1
Max	5

Carrier Allocation

Specifies the carrier frequency allocation. There are two types of allocation, contiguous and non-contiguous. Non-Contiguous frequency allocation is defined as an allocation where two sub-blocks are separated with a sub-block gap:

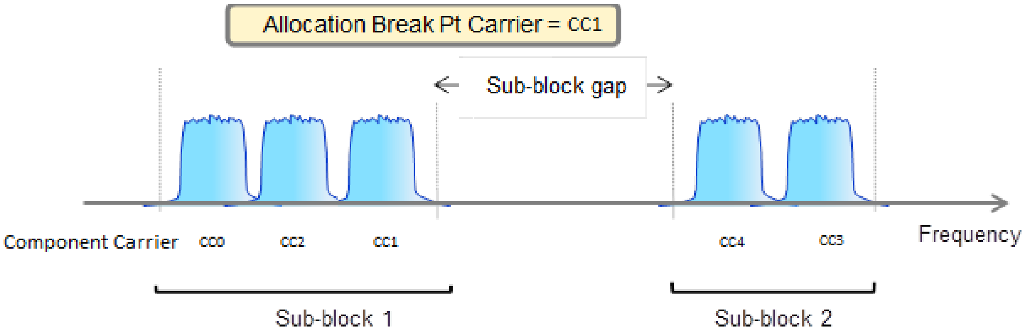
- CONTiguous – All the component carriers belong to one block and no sub-block gap exists
- NCONtiguous – Component carriers are separated into two sub-blocks. Allocation Break Pt Carrier determines how sub-blocks are configured

Remote Command	`[:SENSe]:CCARrier:CONFig:ALLocation CONTiguous | NCONtiguous` `[:SENSe]:CCARrier:CONFig:ALLocation?`
Example	`:CCAR:CONF:ALL CONT` `:CCAR:CONF:ALL?`
Preset	CONTiguous
State Saved	Saved in instrument state
Range	Contiguous|Non-Contiguous

Non-Contiguous Break at

Specifies an allocation break point in non-contiguous carrier allocation. First sub-block starts from the lowest frequency carrier and stops at the allocation break point carrier. Next sub-block starts from the next upper frequency carrier and ends at the highest frequency carrier.

one example is shown below. In the example carrier indices are not in the order of carrier frequency. In the example, Allocation Break Pt Carrier is CC1. It means that sub-block 1 ends at carrier CC1 and sub-block 2 starts at carrier CC4. Sub-block gap is located between carrier CC1 and CC4.



Remote Command	`[:SENSe]:CCARrier:CONFig:ALLocation:NCONtiguous:ABPoint CC0 | … | CC4` `[:SENSe]:CCARrier:CONFig:ALLocation:NCONtiguous:ABPoint?`
Example	`:CCAR:CONF:ALL:NCON:ABP CC0` `:CCAR:CONF:ALL:NCON:ABP?`
Notes	The options CC1~CC4 can be enabled with 9080B/9082B-2FP license
Dependencies	Allocation Break Point is coupled to Number of Component Carriers. For example, Allocation Break Point list will include CC0~CC1 if the number of Component Carriers is 2
Preset	CC0
State Saved	Saved in instrument state
Range	CC0|CC1|CC2|CC3|CC4

Configure Comp Carriers

Lets you perform a detailed configuration of your component carriers, including number of carriers, presets, bandwidth, offset, integration bandwidth, etc.

Configure CCs

Lets you configure System Bandwidth, frequency offsets, and integration bandwidth, and also lets you exclude certain carriers from the measurement.

Number of Component Carriers

See "Number of Component Carriers" on page 2245.

Carrier Allocation

See "Carrier Allocation" on page 2245.

Non-Contiguous Break at

See "Non-Contiguous Break at" on page 2246.

System BW

Enables you to set the system bandwidth of each component carrier for LTE-Advanced / NB-IoT signal (which also determines the total number of resource blocks for Modulation Analysis measurement).

Remote Command	`[:SENSe]:CCARrier0|…|4:RADio:STANdard:BANDwidth B1M4 | B3M | B5M | B10M | B15M | B20M | B200K` `[:SENSe]:CCARrier0|…|4:RADio:STANdard:BANDwidth?`
Example	`:CCAR4:RAD:STAN:BAND B5M`
Preset	B5M
State Saved	Yes
Range	1.4 MHz (6 RB) | 3 MHz (15 RB) | 5 MHz (25 RB) | 10 MHz (50 RB) | 15 MHz (75 RB) | 20 MHz (100 RB) | 200kHz (NB-IoT)
Backwards Compatibility SCPI	`[:SENSe]:RADio:STANdard:BANDwidth`

Measure Carrier

Sets whether to measure this component carrier or not.

Remote Command	`[:SENSe]:CCARrier0|…|4[:STATe] OFF | ON | 0 | 1` `[:SENSe]:CCARrier0|…|4[:STATe]?`
Example	`:CCAR0 ON` `:CCAR0?`
Notes	The command is used with a sub-op code <n> (default=0) to specify the component carrier for configuration. The range of the sub-op code is determined by the number of component carriers
Preset	ON
State Saved	Saved in instrument state
Range	On|Off

Frequency Offset

Sets the component carrier center frequency as offset from the Carrier Ref Frequency.

Remote Command	`[:SENSe]:CCARrier<n>:FREQuency:OFFSet <freq>` `[:SENSe]:CCARrier<n>:FREQuency:OFFSet?`
Example	`:CCAR4:FREQ:OFFS 10MHz` `:CCAR4:FREQ:OFFS?`
Notes	Used with a sub-op code <n> (default=0) to specify the component carrier for configuration. The range of the sub-op code is determined by the number of component carriers
Preset	0Hz
State Saved	Saved in instrument state
Min	-3.5GHz
Max	3.5GHz

Spectrum

Determines if the spectrum of the incoming data is mirrored or not. The actual mirroring is accomplished by conjugating the complex time data.

Note that only the Modulation Analysis measurement and Conformance EVM measurement support this feature.

Remote Command	`[:SENSe]:CCARrier0|…|4:SPECtrum NORMal	INVert` `[:SENSe]:CCARrier0|…|4:SPECtrum?`
Example	`:CCAR0:SPEC INV` `:CCAR0:SPEC?`
Preset	NORM
State Saved	Yes
Range	Normal | Invert
Backwards Compatibility SCPI	`[:SENSe]:SPECtrum`

UL/DL Configuration

Allows you to set the Uplink and Downlink allocation configuration of the signal being measured. The choice of link direction will determine which slot in the frame is used for uplink transmission, and which slot for downlink transmission.

Remote Command	`[:SENSe]:CCARrier0|…|4:RADio:STANdard:ULDL CONF0	…	CONF6` `[:SENSe]:CCARrier0|…|4:RADio:STANdard:ULDL?`
Example	`:CCAR0:RAD:STAN:ULDL CONF0`
Notes	CONF0: Configuration 0 (DSUUUDSUUU) CONF1: Configuration 1 (DSUUDDSUUD)

	CONF2: Configuration 2 (DSUDDDSUDD) CONF3: Configuration 3 (DSUUUDDDDD) CONF4: Configuration 4 (DSUUDDDDDD) CONF5: Configuration 5 (DSUDDDDDDD) CONF6: Configuration 6 (DSUUUDSUUD)
Preset	CONF0
State Saved	Yes
Range	Configuration 0|Configuration 1|Configuration 2|Configuration 3|Configuration 4|Configuration 5|Configuration 6
Backwards Compatibility SCPI	`[:SENSe]:RADio:STANdard:ULDL`

Dw/GP/Up Len

This control allows you to set the DwPTS/GP/UpPTS length configuration of the signal being measured. The choice of link direction will determine the length of DwPTS, GP and UpPTS in the Special Subframe.

Remote Command	`[:SENSe]:CCARrier0|…|4:RADio:STANdard:DGPU CONF0 | … | CONF9` `[:SENSe]:CCARrier0|…|4:RADio:STANdard:DGPU?`
Example	`:CCAR0:RAD:STAN:DGPU CONF0`
Notes	CONF0: Configuration 0 CONF1: Configuration 1 CONF2: Configuration 2 CONF3: Configuration 3 CONF4: Configuration 4 CONF5: Configuration 5 CONF6: Configuration 6 CONF7: Configuration 7 CONF8: Configuration 8 CONF9: Configuration 9
Dependencies	The special sub-frame configuration 9 is only enabled when it is LTE-Advanced TDD
Preset	CONF0
State Saved	Yes
Range	Configuration 0|Configuration 1|Configuration 2|Configuration 3|Configuration 4|Configuration 5|Configuration 6|Configuration 7|Configuration 8|Configuration 9
Backwards Compatibility SCPI	`[:SENSe]:RADio:STANdard:DGPU`

CHP Power Integ BW

Specifies the range of integration used in calculating the power in the component carrier s in the CHP measurement.

Remote Command	`[:SENSe]:CCARrier0|…|4:CHPower:BANDwidth:INTegration <freq>` `[:SENSe]:CCARrier0|…|4:CHPower:BANDwidth:INTegration?`
Example	`:CCAR0:CHP:BAND:INT 20MHz` `:CCAR0:CHP:BAND:INT?`
Notes	You must be in LTEATDD/LTEAFDD Mode to use this command. Use :INSTrument:SELect to set the mode
Couplings	When System Bandwidth of the parameter set is changed, the value of this parameter also changes as shown in the following table.

System Bandwidth	CHP Integ BW
1.4 MHz (B1M4)	1.4 MHz
3 MHz (B3M)	3 MHz
5 MHz (B5M)	5 MHz
10 MHz (B10M)	10 MHz
15 MHz (B15M)	15 MHz
20 MHz (B20M)	20 MHz
200 kHz(B200K)	200 kHz

Preset	5 MHz
State Saved	Saved in instrument state
Min	100 kHz
Max	20 MHz
Backwards Compatibility SCPI	`[:SENSe]:CHPower:BANDwidth:INTegration` `[:SENSe]:CHPower:BWIDth:INTegration`

ACP Power Integ BW

Specifies the Measurement Noise Bandwidth used to calculate the power in the component carriers in the ACP measurement.

Remote Command	`[:SENSe]:CCARrier0|…|4:ACPower:BANDwidth[1]|2:INTegration <freq>` `[:SENSe]:CCARrier0|…|4:ACPower:BANDwidth[1]|2:INTegration?`
Example	`:CCAR0:ACP:BAND:INT 20MHz` `:CCAR0:ACP:BAND:INT?`

Notes	Carrier sub op code, 1 is for BTS, 2 for MS. Default is BTS You must be in the LTEATDD/LTEAFDD mode. Use :INSTrument:SELect to set the mode
Couplings	When System Bandwidth of the parameter set is changed, the value of this parameter also changes as shown in the following table.

System Bandwidth	BTS ACP Meas Noise BW	MS ACP Meas Noise BW
1.4 MHz (B1M4)	1.095 MHz	1.08 MHz
3 MHz (B3M)	2.715 MHz	2.7 MHz
5 MHz (B5M)	4.515 MHz	4.5 MHz
10 MHz (B10M)	9.015 MHz	9.0 MHz
15 MHz (B15M)	13.515 MHz	13.5 MHz
20 MHz (B20M)	18.015 MHz	18.0 MHz
200 kHz(B200K)	180 kHz	180 kHz

Preset	4.515 MHz|4.5 MHz
State Saved	Yes
Min	100 kHz
Max	20 MHz
Backwards Compatibility SCPI	`[:SENSe]:ACPower:CARRier[1]|2:LIST:BANDwidth[:INTegration]` `[:SENSe]:ACPower:CARRier[1]|2:LIST:BWIDth[:INTegration]`

SEM Power Integ BW

Specifies the integration bandwidth used to calculate the power in the component carriers in SEM measurement.

Remote Command	`[:SENSe]:CCARrier0|…|4:SEMask:BANDwidth[1]|2:INTegration <freq>` `[:SENSe]:CCARrier0|…|4:SEMask:BANDwidth[1]|2:INTegration?`
Example	`:CCAR0:SEM:BAND:INT 20MHz` `:CCAR0:SEM:BAND:INT?`
Notes	Bandwidth sub op code, 1 is for BTS, 2 for MS. Default is BTS You must be in LTEATDD/LTEAFDD Mode to use this command. Use :INSTrument:SELect to set the mode
Couplings	When System Bandwidth of the parameter set is changed, the value of this parameter also changes as shown in the following table. Note that you cannot set the value exceeding the corresponding System Bandwidth

	System Bandwidth	**BTS SEM Integ BW**	**MS SEM Integ BW**
	1.4 MHz (B1M4)	1.095 MHz	1.08 MHz
	3 MHz (B3M)	2.715 MHz	2.7 MHz
	5 MHz (B5M)	4.515 MHz	4.5 MHz
	10 MHz (B10M)	9.015 MHz	9.0 MHz
	15 MHz (B15M)	13.515 MHz	13.5 MHz
	20 MHz (B20M)	18.015 MHz	18.0 MHz
	200 kHz(B200K)	180 kHz	180 kHz
Preset	4.515 MHz|4.5 MHz		
State Saved	Saved in instrument state		
Min	100 kHz		
Max	20 MHz		
Backwards Compatibility SCPI	`[:SENSe]:SEMask:BANDwidth[1]|2:INTegration`		

Carrier Config Presets

Lets you configure the Component Carrier presets.

Preset ETC

The ETC configuration is applied. The component carrier parameters are dynamically changed using values of the parameters of each test configuration under Carrier Config Presets menu when some test configuration is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig NONE | ETC1 | ETC2 | ETC3` `[:SENSe]:CCARrier:CONFig?`
Example	`:CCAR:CONF ETC1` `:CCAR:CONF?`
Notes	The control for NONE is not available
State Saved	Saved in instrument state
Range	ETC1|ETC2|ETC3

Max BTS RF Bandwidth

Sets max BS RF bandwidth used when the carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:RFBW <freq>` `[:SENSe]:CCARrier:CONFig:RFBW?`
Example	`:CCAR:CONF:RFBW 40MHz` `:CCAR:CONF:RFBW?`
Preset	40MHz
State Saved	Saved in instrument state
Min	1.4MHz
Max	200 MHz

Carrier Spacing Delta

Sets delta channel spacing used when the carrier configuration preset runs. Channel spacing is determined from this value and the default channel spacing defined in the standard, i.e. Channel spacing = (BW_{chan1} + BW_{chan2}) * 0.5 + [the delta spacing]. Since this value is a difference from the default spacing, this value can be negative to allow narrower channel spacing. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:SPACing:DELTa <freq>` `[:SENSe]:CCARrier:CONFig:SPACing:DELTa?`
Example	`:CCAR:CONF:SPAC:DELT -200kHz` `:CCAR:CONF:SPAC:DELT?`
Preset	0Hz
State Saved	Saved in instrument state
Min	-1.0 MHz
Max	10.0 MHz

ETC1 Attributes

Sets ETC1 carrier configuration.

Max Number of Component Carriers

Sets max component carriers placed when the ETC1 carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC1:CMAX <integer>` `[:SENSe]:CCARrier:CONFig:ETC1:CMAX?`
Example	`:CCAR:CONF:ETC1:CMAX 5`

	`:CCAR:CONF:ETC1:CMAX?`
Preset	5
State Saved	Saved in instrument state
Max	5
Min/Max	1

Component Carrier System BW

Sets bandwidth of the component carriers placed when the ETC1carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC1:BANDwidth B1M4 | B3M | B5M | B10M | B15M | B20M | B200K` `[:SENSe]:CCARrier:CONFig:ETC1:BANDwidth?`
Example	`:CCAR:CONF:ETC1:BAND B5M` `:CCAR:CONF:ETC1:BAND?`
Preset	B5M
State Saved	Saved in instrument state
Range	1.4MHz|3MHz|5MHz|10MHz|15MHz|20MHz|200kHz

Component Carrier Narrowest BW

Sets narrowest bandwidth of the component carriers placed when the ETC1 carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC1:BANDwidth:NARRowest B1M4 | B3M | B5M | B10M | B15M | B20M | B200K` `[:SENSe]:CCARrier:CONFig:ETC1:BANDwidth:NARRowest?`
Example	`:CCAR:CONF:ETC1:BAND:NARR B1M4` `:CCAR:CONF:ETC1:BAND:NARR?`
Preset	B1M4
State Saved	Saved in instrument state
Range	1.4MHz|3MHz|5MHz|10MHz|15MHz|20MHz|200kHz

ETC2 Attributes

Sets ETC2 carrier configuration.

Max Number of Component Carriers

Sets max component carriers placed when the ETC2 carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC2:CMAX <integer>` `[:SENSe]:CCARrier:CONFig:ETC2:CMAX?`
Example	`:CCAR:CONF:ETC2:CMAX 5` `:CCAR:CONF:ETC2:CMAX?`
Preset	5
State Saved	Saved in instrument state
Min	1
Max	5

Carrier Side (with BTS RF BW)

Select the side of RF bandwidth to place the ETC2 component carriers. When this value is changed, the carrier configuration preset is initiated.

- NEGative - Negative (lower) edge of RF bandwidth. If the option is selected, the available component carriers will be placed sequentially from the lower edge of the RF bandwidth starting from first
- POSitive - Positive (upper) edge of RF bandwidth, If the option is selected, the available component carriers will be placed sequentially from the upper edge of the RF bandwidth starting from first

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC2:BANDwidth:SIDE NEGative | POSitive` `[:SENSe]:CCARrier:CONFig:ETC2:BANDwidth:SIDE?`
Example	`:CCAR:CONF:ETC2:BAND:SIDE NEG` `:CCAR:CONF:ETC2:BAND:SIDE?`
Preset	NEGative
State Saved	Saved in instrument state
Range	NEGative|POSitive

Component Carrier System BW

Sets carrier bandwidth of the component carriers placed when the ETC2 carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC2:BANDwidth:CARRier[1]|2|…|5 B1M4 | B3M | B5M | B10M | B15M | B20M | B200K` `[:SENSe]:CCARrier:CONFig:ETC2:BANDwidth:CARRier?`
Example	`:CCAR:CONF:ETC2:BAND:CARR B5M` `:CCAR:CONF:ETC2:BAND:CARR?`
Dependencies	The Carrier Bandwidth is coupled to Max Component Carriers. The settings are enabled following the Max Component Carriers. For example, the 1st Carrier Bandwidth and 2nd Carrier Bandwidth will be available if the Max Component Carriers is 2
Preset	B5M
State Saved	Saved in instrument state
Range	1.4MHz|3MHz|5MHz|10MHz|15MHz|20MHz|200kHz

ETC3 CC Bandwidth

Sets the bandwidth of the component carriers placed when the ETC3 carrier configuration preset runs. When this value is changed, the carrier configuration preset is initiated.

Remote Command	`[:SENSe]:CCARrier:CONFig:ETC3:BANDwidth B1M4 | B3M | B5M | B10M | B15M | B20M | B200K` `[:SENSe]:CCARrier:CONFig:ETC3:BANDwidth?`
Example	`:CCAR:CONF:ETC3:BAND B5M` `:CCAR:CONF:ETC3:BAND?`
Preset	B5M
State Saved	Saved in instrument state
Range	1.4MHz|3MHz|5MHz|10MHz|15MHz|20MHz|200kHz

3.6.8.4 Meas Standard

Enables you to access Preset to Standard functions.

In LTE-Advanced TDD Mode, the parameters under Predefined Params impact the gate or trigger length and delay of the following measurements:

- Monitor Spectrum
- Channel Power
- ACP
- Power Stat CCDF

- Occupied BW
- Spectrum Emission Mask
- Spurious Emission

In LTE-Advanced FDD Mode, the Predefined Parameters in this section are used in the Transmit On/Off Power measurement. The Modulation Analysis measurement has its specific Predefined Parameters setting.

In LTE V2X Mode, Predefined parameters apply to all LTE V2X measurements.

System BW

Sets the demodulator to the specified bandwidth and configures the settings of every component carrier according to the default values listed in table for the current direction (Uplink or Downlink).

For example, when Number of Component is 3, after executing the command RAD:STAN:PRES B5M or selecting corresponding Bandwidth in the dropdown menu, all the 3 component carriers are configured as 5Mhz bandwidth, and all the settings of these 3 component carriers are set according to the table.

Remote Command	`[:SENSe]:RADio:STANdard:PRESet B1M4 | B3M | B5M | B10M | B15M | B20M | B200K`
Example	`:RAD:STAN:PRES B5M`
Notes	B200K selection is available in LTE-A FDD mode B200K option is for NB-IoT which requires N9080EM3E license
Couplings	Preset To Standard presets parameter values listed in section “Values for each Preset To Standard”. And the system bandwidth of each component carrier under the Component Carrier Setup will be preset to the selected one
Preset	B5M
State Saved	Yes
Range	1.4 MHz (6 RB) | 3 MHz (15 RB) | 5 MHz (25 RB) | 10 MHz (50 RB) | 15 MHz (75 RB) | 20 MHz (100 RB) | 200 kHz (NB-IoT)

UL/DL Config

Sets the TDD UL/DL Allocation parameter of each carrier to the selected value.

Remote Command	`[:SENSe]:RADio:STANdard:PRESet:ULDL CONF0 | … | CONF6` `[:SENSe]:RADio:STANdard:PRESet:ULDL?`
Example	`:RAD:STAN:PRES:ULDL CONF0`
Notes	CONF0: Configuration 0 (DSUUUDSUUU)

	CONF1: Configuration 1 (DSUUDDSUUD) CONF2: Configuration 2 (DSUDDDSUDD) CONF3: Configuration 3 (DSUUUDDDDD) CONF4: Configuration 4 (DSUUDDDDDD) CONF5: Configuration 5 (DSUDDDDDDD) CONF6: Configuration 6 (DSUUUDSUUD)
Dependencies	When the setting is selected, the ULDL Alloc per component carrier under the Component carrier Setup will be preset to the selected value
Preset	CONF0
State Saved	Yes
Range	Configuration 0|Configuration 1|Configuration 2|Configuration 3|Configuration 4|Configuration 5|Configuration 6

Dw/GP/Up Len

Sets the TDD special sub-frame configuration of each component carrier to the selected value.

Remote Command	`[:SENSe]:RADio:STANdard:PRESet:DGPU CONF0 | … | CONF9` `[:SENSe]:RADio:STANdard:PRESet:DGPU?`
Example	`:RAD:STAN:PRES:DGPU CONF0`
Notes	CONF0: Configuration 0 CONF1: Configuration 1 CONF2: Configuration 2 CONF3: Configuration 3 CONF4: Configuration 4 CONF5: Configuration 5 CONF6: Configuration 6 CONF7: Configuration 7 CONF8: Configuration 8 CONF9: Configuration 9
Dependencies	When the setting is selected, the Dw/GP/Up Len per Component Carrier under the Component Carrier Setup will be preset to the selected value The special sub-frame configuration 9 is only enabled when it is LTE-Advanced TDD
Preset	CONF0
State Saved	Yes
Range	Configuration 0|Configuration 1|Configuration 2|Configuration 3|Configuration 4|Configuration 5|Configuration 6|Configuration 7|Configuration 8|Configuration 9

Analysis Slot

Specifies the starting analysis slot. The measurement will adjust the gate delay or trigger delay according to this parameter.

Remote Command	`[:SENSe]:RADio:SLOT TS0 | TS1 | DPTS1 | UPTS1 | TS4 | TS5 | TS6 | TS7 | TS8 | TS9 | TS10 | TS11 | TS12 | TS13 | TS14 | TS15 | TS16 | TS17 | TS18 | TS19` `[:SENSe]:RADio:SLOT?`
Example	`:RAD:SLOT TS0`
Couplings	Measurement's gate length or meas interval will couple to the parameter
Preset	TS0
State Saved	Yes
Range	TS0 | TS1 | DwPTS1 | UpPTS1 | TS4 | TS5 | TS6 | TS7 | TS8 | TS9 | TS10 | TS11 | TS12(DwPTS2) | TS13 (UpPTS2) | TS14 | TS15 | TS16 | TS17 | TS18 | TS19

Meas Interval

This parameter specifies the desired slots count that needs to be analyzed. The measurement will adjust the gate length or meas interval according to this parameter.

For NB-IoT uplink cases scenarios, when Measure NPRACH is Off, this parameter indicates not only the slots' count to be analyzed, but the time elapse of the off power measurements as well.

In LTE-A FDD Mode, this parameter only appears in the Transmit On|Off Power measurement.

Remote Command	`[:SENSe]:RADio:MINTerval <integer>` `[:SENSe]:RADio:MINTerval`
Example	`:RAD:MINT 1`
Notes	The backwards compatible command [:SENSe]:PVTime:MINTerval is available in LTE FDD & LTE-A FDD Modes
Dependencies	This parameter is disabled when all the below conditions are met at the same time: – System BW is "200 kHz (NB-IoT)" – Direction is "uplink" – NB-IoT Subcarrier Spacing is "3.75kHz" – Meas NPRACH is "OFF"
Couplings	Disabled when the "Measure PRACH" is in scope and its value is not off, then the actual meas interval is the length PRACH or SRS channel

	For NB-IoT case scenario, when the parameter is disabled, its value is automatically determined by both Meas NPRACH:

Meas NPRACH	Meas Interval
Preamble0	3 slots
Preamble1	4 slots

Preset	1
State Saved	Yes
Min	1
Max	20, when System BW is NOT "200 kHz (NB-IoT) 16, otherwise
Backwards Compatibility SCPI	LTE: `[:SENSe]:PVTime:MINTerval`

CP Length

Specifies whether the cyclic prefix is configured as NORMal or EXTended for power measurement. The parameter will affect the gate length or meas interval parameters.

In LTE-A FDD Mode, this parameter only appears in the Transmit On|Off Power measurement.

Remote Command	`[:SENSe]:RADio:CPLength NORMal | EXTended` `[:SENSe]:RADio:CPLength?`
Example	`:RAD:CPL NORM`
Notes	The backwards compatible SCPI command [:SENSe]:PVTime:CPLength is available in LTE FDD & LTE-A FDD Modes
Dependencies	Disabled when System BW is set to "200 kHz (NB-IoT)" and Direction is "uplink"
Couplings	Set to NORMal when System BW is set to "200 kHz (NB-IoT)"
Preset	NORMal
State Saved	Yes
Range	Normal|Extended
Backwards Compatibility SCPI	LTE: `[:SENSe]:PVTime:CPLength`

Measure PRACH/SRS

Specifies whether the analysis slot is used for PRACH channel or SRS and the PRACH preamble format of the analysis slot.

The measurement will adjust the gate length or meas interval according to this parameter.

Remote Command	`[:SENSe]:RADio:MEASure OFF | PPF0 | PPF1 | PPF2 | PPF3 | PPF4 | SRS | DSRS` `[:SENSe]:RADio:MEASure?`
Example	`:RAD:MEAS OFF`
Couplings	If direction is downlink, the control is disabled and the value is set to off If this control value is not off, Meas Interval is disabled
Preset	OFF
State Saved	Yes
Range	Off|Preamble 0|Preamble 1|Preamble 2|Preamble 3|Preamble 4|SRS|DSRS

Reference Config

Specifies which component carrier's ULDL Allocation Configuration and Dw/Up Length Configuration settings are used to adjust time slot to be measured automatically. For Modulation Analysis measurement, this control specifies which CC is used as the reference CC for time alignment results.

In LTE-A FDD Mode, this parameter only appears in the Transmit On|Off Power and Modulation Analysis measurements.

Remote Command	`[:SENSe]:RADio:RCONfig CC0 | … | CC4` `[:SENSe]:RADio:RCONfig?`
Example	`:RAD:RCON CC0`
Notes	The options CC1~CC4 can be enabled with 9080B/9082B-2FP license
Dependencies	Reference Configuration is coupled to Number of Component Carriers. For example, reference configuration list will include CC0~CC1 if the number of Component Carriers is 2
Preset	CC0
State Saved	Yes
Range	CC0|CC1|CC2|CC3|CC4

3.6.8.5 Advanced

Contains controls for setting advanced functions of the instrument.

This tab does not appear in VXT.

Noise Floor Extension

Allows you to turn on/configure the **Noise Floor Extension** (NFE) function. Some Modes (such as Spectrum Analyzer), support two states of NFE, Full and Adaptive.

The `ON` state (in Modes that do not support Adaptive NFE) matches the `FULL` state (in Modes that *do* support Adaptive NFE).

In `ON` or `FULL` NFE, the expected noise power of the instrument (derived from a factory calibration) is subtracted from the trace data. This will usually reduce the apparent noise level by about 10 dB in low band, and 8 dB in high band (>~3.6 GHz).

In Adaptive NFE, there is not the same dramatic visual impact on the noise floor as there is in Full NFE. Adaptive NFE controls the amount of correction that is applied based on other instrument settings like RBW, averaging and sweep time. Adaptive NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement, such as settings that provide more averaging. The result is that when not much averaging is being performed, the signal displays more like the NFE-off case; and when lots of averaging is being performed, the signal displays more like the full-NFE case.

Adaptive NFE (in Modes that support it) is recommended for general-purpose use. For fully ATE (automatic test equipment) applications, where the distraction of a person using the instrument is not a risk, Full NFE is recommended.

NFE works with any RBW, VBW, detector, any setting of Average Type, any amount of trace averaging, and any signal type. It is ineffective when the trace is not smoothed (smoothing processes include narrow VBWs, trace averaging, and long sweep times with the detector set to Average or Peak). It works best with extreme amounts of smoothing, and with the average detector, with the Average Type set to Power.

In those cases where the cancellation is ineffective, it nonetheless has no undesirable side-effects. There is no significant speed impact in having **Noise Floor Extension** on.

The best accuracy is achieved when substantial smoothing occurs in each point before trace averaging. Thus, when using the average detector, results are better with long sweep times and fewer trace averages. When using the sample detector, the VBW filter should be set narrow with less trace averaging, instead of a wide VBW filter with more trace averaging.

NOTE

Noise Floor Extension has no effect unless the RF Input is selected, therefore it does nothing when **External Mixing** is selected.

In Modes that support Adaptive NFE, the default state of NFE is **Adaptive**. In Modes that do not support Adaptive NFE, the default state of NFE is `OFF`. Prior to the introduction of Adaptive NFE (firmware version A.18.00), the default state of NFE was `OFF` for all Modes.

With the introduction of Adaptive NFE, the menu control is changed from **On/Off** to **Full/Adaptive/Off**. For SCPI Backwards Compatibility, the existing SCPI command to turn NFE on and off was retained, and a new command was added to set the state to turn Adaptive On and Off

`[:SENSe]:CORRection:NOISe:FLOor ON|OFF|1|0` is retained, default changed to On for modes which support Adaptive NFE

`[:SENSe]:CORRection:NOISe:FLOor:ADAPtive ON|OFF|1|0` is added (for certain Modes), default=On

FULL = `:CORRection:NOISe:FLOor ON` plus `:CORRection:NOISe:FLOor:ADAPtive ON`

Remote Command	`[:SENSe]:CORRection:NOISe:FLOor ON | OFF | 1 | 0` `[:SENSe]:CORRection:NOISe:FLOor?`
Example	`:CORR:NOIS:FLO ON`
Dependencies	Only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear, but the SCPI command is accepted without error (but has no effect)
Couplings	If NFE is enabled in any Mode manually, a prompt is displayed reminding you to perform the Characterize Noise Floor operation if it is needed If NFE is enabled via SCPI and a Characterize Noise Floor operation is needed, an error will be entered in the system error queue
Preset	Unaffected by **Mode Preset**. Turned ON at startup and by **Restore Mode Defaults** in Modes that support Adaptive. Turned OFF at startup and by **Restore Mode Defaults** in Modes that do not support Adaptive
State Saved	No

Remote Command	`[:SENSe]:CORRection:NOISe:FLOor:ADAPtive ON | OFF | 1 | 0` `[:SENSe]:CORRection:NOISe:FLOor:ADAPtive?`

Example	First turn NFE on, this is Full mode
	`:CORR:NOIS:FLO ON`
	Then set it to Adaptive
	`:CORR:NOIS:FLO:ADAP ON`

Dependencies	Only available in Modes that support Adaptive NFE Only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear, however the SCPI command is accepted without error, but has no effect
Couplings	Sending `:CORR:NOIS:FLO ON` turns NFE Adaptive OFF for backwards compatibility, so to turn Adaptive on, you must issue the commands in the proper order, as shown in the example above
Preset	Not affected by **Mode Preset**, but set to ON at startup and by **Restore Mode Defaults**
State Saved	No

More Information

The instrument is characterized in the factory (or during a field calibration) with a model of the noise, referred to the input mixer, versus frequency in each band and path combination. Bands are 0 (low band) and 1 through 4 (high band) in a 26.5 GHz instrument, for example. Paths include normal paths, preamp paths, the electronic attenuator, etc.

In most band/path combinations, the noise can be well characterized based on just two parameters and the instrument frequency response before compensation for frequency-dependent losses.

After the noise density at the input mixer is estimated, the effects of the input attenuator, RBW, detector, etc. are computed to get the estimated input-port-referred noise level.

In the simplest case, the measured power (signal plus analyzer noise) in each display point (bucket) is compensated by subtracting the estimated noise power, leaving just the signal power. This is the operation when the detector is Average, and the Average Type is set to Power.

In other cases, operation is often not quite as good but still highly effective. With peak detection, the noise floor is estimated based on the RBW and the duration of the bucket using the same equations used in the noise marker function. The voltage of the noise is subtracted from the voltage of the observed signal-plus-noise measurement to compute the estimated signal voltage. The peak detector is one example of processing that varies with detector to give good estimates of the signal level without the analyzer noise.

For best operation, the average detector and the power scale are recommended, as already stated. Peak detection for pulsed-RF can still give excellent effectiveness. FFT analysis does not work well, and does not do NFE well, with pulsed-RF signals, so this combination is not recommended. Negative peak detection is not very useful, either. Sample detection works well, but is never better than the average detector because it doesn’t smooth as well. The Normal detector is a combination of peak and negative peak behaviors, and works about as well as these.

For best operation, extreme smoothing is desirable, as already stated. Using narrow VBWs works well, but using very long bucket durations and the average detector works best. Reducing the number of trace points will make the buckets longer.

For best operation, the power scale (Average Type = Power) is optimum. When making CW measurements in the presence of noise without NFE, averaging on the decibel scale has the advantage of reducing the effect of noise. When using NFE, the NFE does an even better job than using the log scale ever could. Using NFE with the log scale is not synergistic, though; NFE with the power scale works a little better than NFE with log averaging type.

The results from NFE with internal preamp can often be lower than the theoretical noise in a signal source at room temperature, a noise density of -174 dBm/Hz. This is expected and useful behavior, because NFE is designed to report the amount of input signal that is in excess of the thermal noise, not the amount that includes the thermal noise. This can be a useful behavior because thermal noise often interferes with what you want to measure, instead of being part of what you want to measure. Note that NFE is not adequately accurate to always be able to read below kTB.

Adaptive NFE provides an alternative to fully-on and -off NFE. Fully-on NFE can, notably in cases with little or no averaging of the spectrum, result in a display that is distractingly unfamiliar in the variability in response to low level signals. Fully-off NFE fails to achieve the potential improvement in dynamic range and associated accuracy of measurement of low-level signals. Adaptive NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement—those settings with high degrees of variance reduction through some variant of averaging. When the potential improvement is small, the display acts like the NFE-off case, and when it is high, it acts like the fully-on case, and in-between, application is a compromise between attractiveness and effectiveness.

On instruments with the NF2 license installed, the calibrated Noise Floor used by Noise Floor Extensions should be refreshed periodically. Keysight recommends that the **Characterize Noise Floor** operation be performed after the first 500 hours of operation, and once every calendar year. The control to perform this is located in the **System, Alignments, Advanced** menu. If you have not done this yourself at the recommended interval, then when you turn on Noise Floor Extensions, the instrument will prompt you to do so with a dialog that says:

“This action will take several minutes to perform. Please disconnect all cables from the RF input and press Enter to proceed. Press ESC to cancel, or Postpone to postpone for a week”

If you Cancel, you will be prompted again the next time you turn NFE on. If you postpone, you will be prompted again after a week passes and you then turn NFE on.

3.6.8.6 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, "Global Center Freq" on page 2276) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to `ON`, it applies to all Modes that support Global settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched `ON`, the current Mode’s center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Frequency** remains unchanged.

Adjusting the **Center Frequency** of any Mode that supports Global Settings, while **Global Center Freq** is `ON`, modifies the **Global Center Freq**.

When **Global Center Freq** is switched `OFF`, the **Center Frequency** of the current Mode is unchanged, but now the **Center Frequency** of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is `ON`, the **Global Center Freq** is preset to the preset **Center Frequency** of the current Mode.

This function resets to `OFF` when "Restore Defaults" on page 2278 is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:FREQuency:CENTer ALL | NONE` `:INSTrument:COUPle:FREQuency:CENTer?`
Example	`:INST:COUP:FREQ:CENT ALL` `:INST:COUP:FREQ:CENT?`
Preset	Set to `OFF` on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	`ALL|NONE`

Preset	`OFF`
Backwards Compatibility SCPI	`:GLOBal:FREQuency:CENTer[:STATe] 1 | 0 | ON | OFF` `:GLOBal:FREQuency:CENTer[:STATe]?`

Global EMC Std

When this control is switched `ON`, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the **Global EMC Std**, so you can switch between any of these Modes and the EMC Std remains unchanged.

Adjusting the EMC Std of any Mode that supports Global settings, while **Global EMC Std** is `ON` modifies the **Global EMC Std**.

When **Global EMC Std** is switched `OFF`, the EMC Std of the current Mode remains unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is `ON`, **Global EMC Std** is preset to the preset EMC Std of the current Mode.

This function resets to `OFF` when "Restore Defaults" on page 2278 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:EMC:STANdard ALL | NONE` `:INSTrument:COUPle:EMC:STANdard?`

Example	`:INST:COUP:EMC:STAN ALL` `:INST:COUP:EMC:STAN?`
Dependencies	Only available if Option EMC is installed
Preset	Set to `OFF` on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	`ALL | NONE`

Extend Low Band

The software maintains a Mode Global value called **Extend Low Band**.

Under the current sweep configuration crossing over two bands, when **Extend Low Band** is turned `ON`, the instrument checks whether one band can cover the whole sweep frequency range or not. If it can, then the instrument locks the band; otherwise, it does nothing (the band crossover occurs).

This function does *not* work when **Band Lock** under **System** > **Service** > **Lock Functions** is not -1 (no Band Lock). In that case, **Band Lock** takes priority over **Extend Low Band**.

This function resets to `OFF` when "Restore Defaults" on page 2278 is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:FREQuency:BAND:EXTend 0 | 1 | ON | OFF` `:INSTrument:COUPle:FREQuency:BAND:EXTend?`
Example	`:INST:COUP:FREQ:BAND:EXT 1` `:INST:COUP:FREQ:BAND:EXT?`
Preset	Set to `OFF` by **Global** Settings > **Restore Defaults** and **System** > **Restore Defaults** > **All Modes**
Range	`ON|OFF`

Restore Defaults

Resets all functions in the **Global** settings menu to `OFF`. Pressing **System**, **Restore Defaults**, **All Modes** has the same effect.

Remote Command	`:INSTrument:COUPle:DEFault`
Example	`:INST:COUP:DEF`
Backwards Compatibility SCPI	`:GLOBal:DEFault`

3.6.9 Sweep

Accesses controls to configure and control the acquisition of data, and the X-axis parameters of the instrument.

Depending on the selected mode and measurement, these controls might include: **Sweep Time**, **Continuous/Single**, **Pause/Resume**, **X Scale** and **Number of Points**.

3.6.9.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See "More Information" on page 1124

Remote Command	`:INITiate:CONTinuous OFF | ON | 0 | 1` `:INITiate:CONTinuous?`

Example	Put instrument into **Single** measurement operation:
	`:INIT:CONT 0`
	`:INIT:CONT OFF`
	Put instrument into **Continuous** measurement operation:
	`:INIT:CONT 1`
	`:INIT:CONT ON`

Preset	`ON` Note that `:SYST:PRES` sets `:INIT:CONT` to `ON`, but `*RST` sets `:INIT:CONT` to `OFF`
State Saved	Saved in instrument state
Annunciation	The **Single/Continuous** icon in the Meas Bar changes depending on the setting: – A line with an arrow is **Single** – A loop with an arrow is **Continuous**
Backwards Compatibility Notes	X-Series A-models had **Single** and **Cont** hardkeys in place of the **SweepSingleCont** softkey. In the X-Series A-models, if in single measurement, the **Cont** hardkey (and `INIT:CONT ON`) switched to continuous measurement, but never restarted a measurement and never reset a sweep X-Series B-models have a **Cont/Single** toggle control instead of **Single** and **Cont** hardkeys, but it is still

true that, if in single measurement, the **Cont/Single** toggle control never restarts a measurement and never resets a sweep

More Information

Continuous Mode	The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the **Average/Hold Num**, the count stops incrementing, but the instrument keeps sweeping See the **Trace** key description under **Trace Average** for the averaging formula used both before and after the **Average/Hold Num** is reached. The trigger condition must be met prior to each sweep The type of trace processing for multiple sweeps is set under the **Trace** key, with choices of **Trace Average**, **Max Hold**, or **Min Hold**
Single Mode	The instrument takes a single sweep when in **Single** mode, or if in average or Max/Min Hold, or if there is a **Waterfall** window displayed, it takes multiple sweeps until the average/hold count reaches the **Average/Hold Num**, then the count stops incrementing, and the instrument stops sweeping See the **Trace** key description under **Trace Average** for the averaging formula used. The trigger condition must be met prior to the sweep The type of trace processing for multiple sweeps is set under the **Trace** key, with choices of **Trace Average**, **Max Hold**, or **Min Hold**

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

- `:INIT:CONT 1` has no effect
- `:INIT:CONT 0` places the instrument in Single Sweep but has no effect on the current sequence until k = N, at which point the current sequence will stop and the instrument will go to the idle state

See "Restart" on page 2279 for details of `:INIT:IMMediate`.

If the instrument is already in **Single** sweep, `:INIT:CONT OFF` has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending `:INIT:IMM` *does* reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending `:CALC:AVER:TCON UP`.

Restart

Restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending `:INIT:IMM`
- Sending `:INIT:REST`

See "More Information" on page 1126

Remote Command	`:INITiate[:IMMediate]` `:INITiate:RESTart`
Example	`:INIT:IMM` `:INIT:REST`
Notes	`:INIT:REST` and `:INIT:IMM` perform exactly the same function
Couplings	Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The `STATus:OPERation` register bits 0 through 8 are cleared , *except* bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The `STATus:QUEStionable` register bit 9 (`INTegrity` sum) is cleared The `SWEEPING` bit is set The `MEASURING` bit is set
Backwards Compatibility Notes	For Spectrum Analysis Mode in ESA and PSA, the **Restart** hardkey and the `:INIT:REST` command restarted trace averages (displayed average count reset to 1) for a trace in **Clear Write**, but did not restart **Max Hold** and **Min Hold** In X-Series, the **Restart** hardkey and the `:INIT:REST` command restart not only **Trace Average**, but **MaxHold** and **MinHold** traces as well

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command `:CALC:AVER:TCON UP`.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

Event	Trace Effect
Clear/Write pressed (even if already in Clear/Write)	Set to mintracevalue
Max Hold pressed (even if already in Max Hold)	Set to mintracevalue
Min Hold pressed (even if already in Min Hold)	Set to maxtracevalue
Trace Average pressed (even if already in Trace Average)	Trace data unaffected but start new sweep/avg/hold
Restart pressed	Trace data unaffected but start new sweep/avg/hold
Parameter requiring restart changed (e.g., RBW)	Trace data unaffected but start new sweep/avg/hold

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is `k`. This `k` is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This `k` is used for comparisons with N, as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, `K`, shows the count for the sweep (data acquisition) in progress. `K` = `k` + 1, with a limit of N. The displayed value `K` changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** un-pauses the measurement. When paused, pressing **Restart** performs a Resume.

Remote Command	`:INITiate:PAUSe` `:INITiate:RESume`

Example	`:INIT:PAUS` `:INIT:RES`
Dependencies	Not displayed in Modes that do not support pausing
Annotation	Only on control

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORt` is sent, the alignment finishes *before* the abort function is performed, so `:ABORt` does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	`:ABORt`
Example	`:ABOR`
Notes	If :`INIT:CONT` is `ON`, then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met If :`INIT:CONT` is `OFF`, then `:INIT:IMM` is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met
Dependencies	For continuous measurement, `:ABORt` is equivalent to the **Restart** key Not all measurements support this command
Status Bits/OPC dependencies	The `STATus:OPERation` register bits 0 through 8 are cleared , *except* bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The `STATus:QUEStionable` register bit 9 (`INTegrity` sum) is cleared Since all the bits that feed into OPC are cleared by `:ABORt`, the Abort command will cause the `*OPC` query to return true

3.6.9.2 Sweep Config

Accesses controls that enable you to configure the Sweep and Control functions of the instrument, such as Sweep Rules.

Sweep Type

Sets the **Sweep Type** of the spurious measurement to either **Auto** or **Swept**.

When in **Auto**, the selections of swept type of ranges are governed by the Best Speed Sweep Type Rule, and FFT analysis might be chosen for some ranges if it speeds up the measurement.

Remote Command	`[:SENSe]:SPURious[:RANGe]:ALL:SWEep:TYPE:AUTO OFF | ON | 0 | 1` `[:SENSe]:SPURious[:RANGe]:ALL:SWEep:TYPE:AUTO?`
Example	`:SPUR:ALL:SWE:TYPE:AUTO 1` `:SPUR:ALL:SWE:TYPE:AUTO?`
Dependencies	Available only when Option N9060A-7FP is installed
Preset	`ON`
State Saved	Saved in instrument state
Range	Auto | Swept
Annotation	When in **Auto**, and the instrument is in FFT analysis, an indicator, “FFT” is displayed at the right bottom of range spectrum trace window

Sweep Time Rules

Switches the instrument between `NORMal` and `ACCuracy` sweep states.

Setting **Auto Sweep Time** to **Accy** (`ACCuracy`) results in slower sweep times, usually about three times as long, but yields better amplitude accuracy for CW signals. The instrument amplitude accuracy specifications only apply when **Auto Sweep Time** is set to **Accy**.

Additional amplitude errors which occur when **Auto Sweep Time** is set to **Norm** are usually well under 0.1 dB, though this is not guaranteed. Because of the faster sweep times and still low errors, **Norm** is the preferred setting of **Auto Sweep Time**. **Auto Sweep Time** is set to **Norm** on a **Preset**. This means that in the Preset state, instrument amplitude accuracy specifications do not apply.

Remote Command	`[:SENSe]:SPURious:SWEep:TIME:AUTO:RULes NORMal | ACCuracy` `[:SENSe]:SPURious:SWEep:TIME:AUTO:RULes?`
Example	`:SPUR:SWE:TIME:AUTO:RUL ACC` `:SPUR:SWE:TIME:AUTO:RUL?`
Notes	This command is implemented as `[:SENSe]:SPURious[:RANGe][:LIST]:SWEep:TIME:AUTO:RULes` to avoid illegal SCPI node definition, so this command should be used as `[:SENSe]:SPURious:SWEep:TIME:AUTO:RULes`
Dependencies	Does not appear in SA Mode in VXT
Preset	`NORMal`
State Saved	Saved in instrument state
Range	`NORMal`|`ACCuracy`

3.6.10 Trace

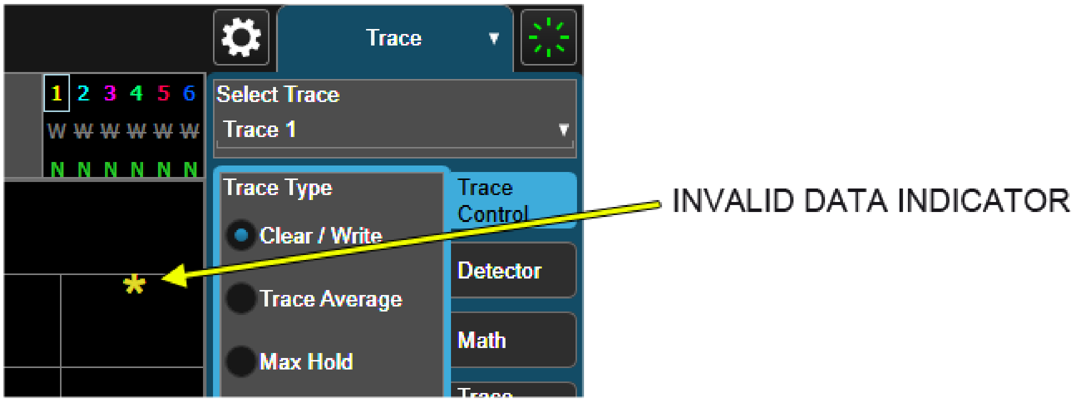
Lets you control the acquisition, display, storage, detection and manipulation of trace data for the available traces.

The "Trace Control" on page 2136 tab of this menu contains radio-button selections for the trace type (**Clear/Write, Trace Average, Max Hold, Min Hold**) and **View/Blank** setting for the selected trace.

A trace is a series of data points, each having an x and a y value. The x value is frequency (or time, in zero span) and the y value is amplitude. Each data point is referred to as a *trace point*. In any given trace, trace point 0 is the first point, and trace point (*sweep_points – 1*) is the last. For example, in a 1001 point trace, the first point is 0 and the last is 1000. Another term sometimes used to describe traces is *bucket*. A bucket is the frequency span of a trace point, equal to the point spacing. For swept analysis, the y value in each bucket is measured while the instrument is sweeping across the bucket. The selected detector determines how it is measured.

When in **Single** Mode, Measurements and their Views save the trace data from the last acquisition. This is true on multiple screens. The marker and trace data will be present whenever the measurement is brought back into focus. The measurement switches for these measurements do not clear the traces, so the data will be present until the next acquisition is completed.

Invalid Data Indicator



The Invalid Data Indicator is displayed whenever the data on the display does not match the settings of the instrument. The most common example of this is when instrument settings have changed in the time since the data in the traces on the display was taken. This means that the screen annotation cannot be guaranteed to match the trace data. For example, if you change **Center Frequency**, the Invalid Data Indicator will display until the trace has been retaken.

If any Trace is in View mode (displaying but not updating) and instrument settings are changed, the Invalid Data Indicator will display as long as that trace remains in View. Traces that are blanked do not turn on the Invalid Data Indicator.

Not all instrument settings require display of the invalid data indicator when they change; only changes that require a new acquisition will cause it to display. For example, changing the Y-Axis scale of the instrument does not cause the invalid data indicator to display, unless the attenuation changes.

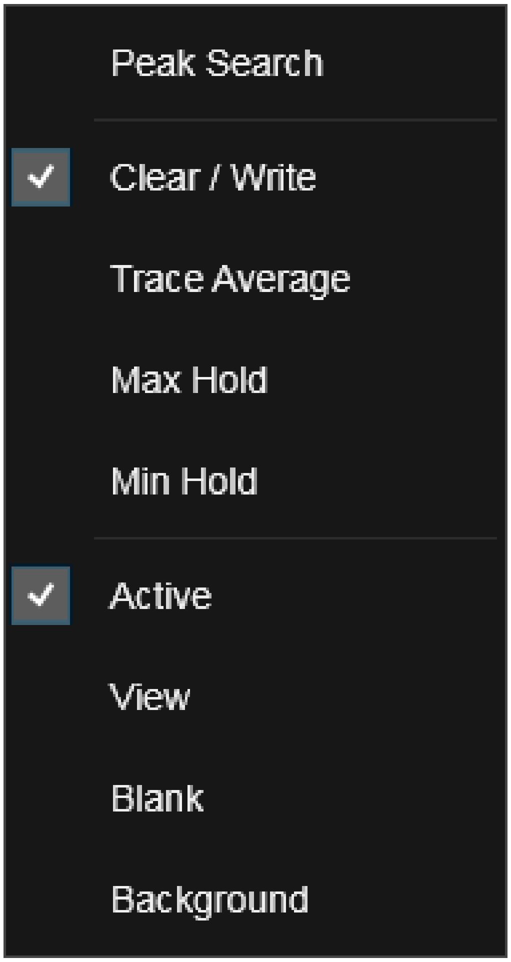
The Invalid Data Indicator is also turned on:

- When the counter is turned on, until the completion of the first count
- When a trace is imported from mass storage and the trace's parameters do not match the current instrument settings
- When a trace is sent to the instrument from a remote interface (since there is no way to know if its settings match)

NOTE **The Invalid Data Indicator has an associated status bit that can be checked at any time to determine whether the indicator is on.**

Trace right-click menu

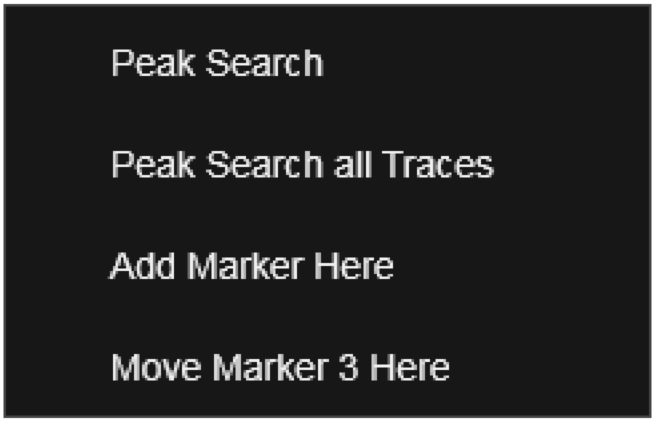
If you right-click on a trace (or touch and hold a trace and wait for the circle to close) you will see the Trace Right-Click Menu:



If you now tap or click on one of the items in this menu, the instrument will perform the corresponding function. **Peak Search** finds the highest peak on the selected Trace. **Clear/Write**, **Trace Average**, **Max Hold** and **Min Hold** set the "Trace Type" on page 2137. **Active**, **View**, **Blank**, and **Background** set the "View/Blank" on page 2142 type.

Waterfall Window

If you right-click on the trace (or touch and hold the trace and wait for the circle to close) in the **Waterfall** window (for example, in the Spectrogram View) you will see the Waterfall Trace Right-Click Menu:



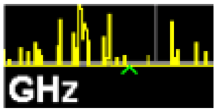
In this menu, **Peak Search** works as above. **Peak Search all Traces** finds the highest peak in the Waterfall window. **Add Marker Here** takes the lowest numbered Marker that is currently Off and turns it On as a **Normal** marker in the Waterfall window at the point where you right-clicked (or touched-and-held). **Move Marker n Here** moves the currently selected Marker to the point in the Waterfall window where you right-clicked (or touched-and-held).

Trace Update Indicator

Trace updates can take one of two forms:

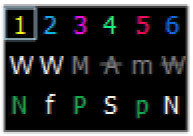
1. The trace is updated in a single operation that affects all of the points in the trace at once. This happens, for example, in the case of very fast (< 200 ms) sweeps, single-chunk FFT’s, and the initial math operation after a math function is set for a trace
2. The trace is updated in a series of discrete steps, with measurement data being gathered between each step. This will be the case for slow sweeps, multi-chunk FFTs, gated sweeps, etc.

In the first case, no update indicator is required. In the second case, however, a visual indicator exists on the trace where the new data is being written. The indicator is a green caret (^) , which moves across the bottom of the graticule showing the current trace point.



Trace Annunciator Panel

This panel appears on the right hand side of the Meas Bar. Here is an explanation of the fields in this panel, as shown below:



1 2 3 4 5 6
W W M ~~A~~ m ~~W~~
N f P S p N

Top Line

On the top line, each trace number is shown, in the trace color. A box is drawn around the currently selected trace.

Middle Line

Below each trace number, is a letter signifying the trace type for that trace number, where

`W`	Clear/Write
`A`	Trace Average
`M`	Max Hold
`m`	Min Hold

If the letter is white, it means the trace is being updated (**Update** = `ON`); if the letter is dimmed , it means the trace is not being updated (**Update** = `OFF`). A strikethrough indicates that the trace is blanked (**Display** = `OFF`). Note that it is possible for a trace to be updating *and* blanked, which is useful if the trace is a trace math component.

Bottom Line

The third line shows the detector type for each trace, or, if trace math is on for that trace, it shows “f” (for “math function”). It is not always possible to have a unique detector for each trace, but the instrument hardware provides the maximum flexibility of detector selection in order to maintain the highest accuracy. The letters used for this readout are

`N`	Normal
`A`	Average
`P`	peak
`p`	negative peak
`S`	Sample
`Q`	Quasi Peak
`E`	EMI Average
`R`	RMS Average
`f`	math function

If the letter is green, the detector is in Auto. If white, the detector has been manually selected.

In the example above, the panel is indicating the following:

- Trace 1: Visible, being updated, in Clear/Write, with Normal detector auto selected
- Trace 2: Visible, being updated, in Clear/Write, being written to with a math function
- Trace 3: Visible, not updating, data was taken in Max Hold, with the peak detector auto selected
- Trace 4: Blanked, not updating, data was taken with Averaging turned on, Sample detector manually selected
- Trace 5: Visible, not updating, data was taken in Min Hold with Negative Peak detector auto selected
- Trace 6: Blanked, not updating, in Clear/Write, with Normal detector manually selected

Trace Annotation

When **Trace Annotation** (see **Display**) is `ON`, each non-blanked trace is labeled on the trace with the detector used to take it, unless a Trace Math function is on for that trace, in which case it is labeled with the "Math Function" on page 1145.

The detector labels are:

`NORM`	Normal
`PEAK`	Peak
`SAMP`	Sample
`NPEAK`	Negative Peak
`RMS`	Average detector with Power Average (RMS)
`LG AVG`	Average detector with Log-Pwr Average
`VAVG`	Average detector with Voltage Average
`QPEAK`	Quasi Peak
`EMI AVG`	EMI Average
`RMS AVG`	RMS Average

The trace math labels are:

`PDIF`	Power Difference
`PSUM`	Power Sum
`LOFF`	Log Offset
`LDIF`	Log Difference

3.6.10.1 Select Trace

Specifies the *selected trace*, which is the trace that will be affected when you change trace settings.

Select Trace appears above the menu panel, indicating that it applies to *all* controls in the menu panel. **Select Trace** is blanked if you select a tab whose controls do *not* depend on the selected trace (for example, **Trace Function**).

Notes	The selected trace is remembered even when not in the **Trace** menu
Dependencies	For the Swept SA measurement: – In Image Suppress mode, when you select a trace it becomes the active trace, and the formerly active trace goes into View – When you turn on Image Suppress, Update turns off for all traces except the selected trace For the ACP measurement, when **Meas Method** is `RBW`, `FAST` or `FPOWer`, **Select Trace** is disabled
Preset	Trace 1
State Saved	Yes

3.6.10.2 Trace Control

The controls on this tab allow you to set the "Trace Type" on page 2137 and its update mode.

There are four Trace Types:

- **Clear/Write**
- **Trace Average**
- **Max Hold**
- **Min Hold**

Each type handles data in a different way.

Each trace also has two values that determine whether it is being written or not, and whether it is being displayed or not. These values, **Update** and **Display,** are described fully in the "View/Blank" on page 2142 control description. Essentially, when **Update** is `ON`, a trace is updating, and when **Update** is `OFF` it is not. When **Display** is `ON`, it is visible and when **Display** is `OFF` it is not. These terms are used throughout the descriptions in this section.

Trace Type

There are four trace Types:

Option	Parameter	SCPI Example	Details
Clear/Write	`WRITe`	`:TRAC2:TYPE WRIT`	See: "Clear/Write" on page 1140
Trace Average	`AVERage`	`:TRAC2:TYPE AVER`	See: "Trace Average" on page 1140
Maximum Hold	`MAXHold`	`:TRAC3:TYPE MAXH`	See: "Max Hold" on page 1141
Minimum Hold	`MINHold`	`:TRAC5:TYPE MINH`	See: "Min Hold" on page 1141

Full descriptions of each type are provided below. You may select one of these types for each trace. Re-selecting the current **Trace Type** initiates the same action that selecting it the first time did, even though it is already selected. For example, selecting **Clear/Write** while **Clear/Write** is already selected will nonetheless clear the trace and begin rewriting it.

Besides the **Trace Type**, the "View/Blank" on page 2142 state must be set to **Active** (**Update**: `ON`, **Display**: `ON`) for a trace to be updating and visible. Selecting any **Trace Type** automatically makes the trace **Active**.

See also: "Trace Mode Backwards Compatibility Commands" on page 1138

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe[1]|2|…|6:TYPE WRITe | AVERage | MAXHold | MINHold`
	`:TRACe[1]|2|…|6:TYPE?`
	For all other measurements:
	`:TRACe[1]|2|3:<meas>:TYPE WRITe | AVERage | MAXHold | MINHold`
	`:TRACe[1]|2|3:<meas>:TYPE?`
	where `<meas>` is the identifier for the current measurement

Example	`:TRAC:TYPE WRIT` `:TRAC:TYPE?`
Couplings	Selecting a **Trace Type** (by pressing any of the Trace Type selections or sending `:TRAC:TYPE`) sets the Trace to **Active** (**Update**: `ON`, **Display**: `OFF`), even if the same trace type was already selected When Detector setting is "Auto" (`[:SENSe]:<meas>:DETector:AUTO?`), Detector (`[:SENSe]:<meas>:DETector[:FUNCtion]?`) switches aligning with the switch of this parameter: "`NORMal`" with `WRITe` (Clear Write), "`AVERage`" with `AVERage`, "`POSitive` (peak)" with `MAXHold`, and "`NEGative` (peak)" with `MINHold`
Preset	Swept SA and Monitor Spectrum: `WRITe` All other measurements: `AVERage` Following **Preset**, all traces are cleared (all trace points set to mintracevalue)
State Saved	The type of each trace is saved in instrument state
Annunciation	The type for each trace is indicated in the Trace annunciator panel on the Measurement Bar

Trace Mode Backwards Compatibility Commands

In earlier instruments, the “Trace Modes” were: Clear/Write, Max Hold, Min Hold, View and Blank. Averaging was global to all traces and was controlled under the **BW/Avg** menu.

In X-Series, trace averaging can be done on a per-trace basis. The Trace Modes (now called Trace Types) are Clear/Write, Trace Average, Max Hold and Min Hold. View and Blank are set separately under "View/Blank" on page 2142.

While this provides more flexibility, it also gives rise to potential backwards compatibility problems. To mitigate these, the old Trace Mode command has been retained and a new Trace Type command has been added. The :`TRACe:MODE` command is retained for backwards compatibility, and the :`TRACe:TYPE`, :`TRACe:UPDate` and :`TRACe:DISPlay` commands introduced for ongoing use. The old Trace Modes are selected using `:TRAC:MODE`, whose parameters are mapped into calls to `:TRACe:TYPE`, `:TRACe:UPDate` and `:TRACe:DISPlay`, and the old global Averaging command `[:SENSe]:AVERage[:STATe]` is provided for backwards compatibility. See the individual command descriptions for details.

When **Average/Hold** in the **Meas Setup**, **Legacy Compatibility** menu is `ON`, the following is true for traces in Max Hold and Min Hold:

- They ignore the **Average/Hold** number; **Single** for Max Hold causes one sweep only, so switching to **Single** stops after the current sweep, and switching to **Cont** starts again without clearing the accumulated result
- Max Hold is not cleared on a **Restart**, **Single** or `:INIT:IMM`, but changing a measurement parameter, like frequency or bandwidth etc., still restarts the Max Hold

Preset	`WRITe`
State Saved	The trace mode is an alias only
Backwards Compatibility SCPI	`:TRACe[1]|2|…|6:MODE WRITe | MAXHold | MINHold | VIEW | BLANk` `:TRACe[1]|2|…|6:MODE?`
Backwards Compatibility Notes	The legacy `:TRACe:MODE` command is retained for backwards compatibility. In conjunction with the legacy `:AVErage` command, it works as follows: – `:AVErage ON|OFF` sets/clears a variable that we will call average for the sake of this discussion. This variable is maintained by the instrument solely for backwards compatibility. See the `[:SENSe]:AVERage[:STATe]` command description below – `:TRACe:MODE WRITe` sets `:TRACe:TYPE WRITe` (Clear/Write) unless average is true, in which case it sets it to `:TRACe:TYPE AVErag`e. It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace – `:TRACe:MODE MAXHold` sets `:TRACe:TYPE MAXHold` (Max Hold). It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace

	– `:TRACe:MODE MINHold` sets `:TRACe:TYPE MINHold` (Min Hold). It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace – `:TRACe:MODE VIEW` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay ON`, for the selected trace – `:TRACe:MODE BLANk` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay OFF`, for the selected trace The query returns the same value as `:TRACe:TYPE?`, meaning that if you set `:TRACe:MODE:VIEW` or `:TRACe:MODE:BLANk`, the query response will not be what you sent `:TRACe[n]:MODE` was formerly used to set the type or “writing mode” of the trace. At that time, View and Blank were writing modes. The new `:TRACe:TYPE` command should be used in the future, but `:TRACe:MODE` is retained to provide backwards compatibility In X-Series, unlike earlier instruments, Max Hold and Min Hold now obey the Average Number and counts up to a terminal value as Average always has As the **Average/Hold Number** now affects **Min Hold** and **Max Hold**, the operations that restart Averaging (for example, the **Restart** key) now also restart **Min Hold** and **Max Hold** As a result of these changes, legacy code that restarts averaging while retaining a running Max Hold will need to be rewritten, because the Max Hold will now restart when the Average does Also, previous to X-Series: – Pressing **Max Hold** while already in **Max Hold** (or doing so remotely) had no effect. Now it will clear the trace and restart the sweep and the Max Hold sequence – Changing the vertical scale (Log/Lin or dB/div) of the display restarted **Max Hold** and **Min Hold**. This is no longer the case
Preset	`OFF`
State Saved	The state of Average is saved in Instrument State for ghosting purposes
Backwards Compatibility SCPI	`[:SENSe]:AVERage[:STATe] ON | OFF | 1 | 0` `[:SENSe]:AVERage[:STATe]?`
Backwards Compatibility Notes	Previous to X-Series, Averaging (also sometimes known as trace averaging) was global to all traces, that is, it was either on or off for all active traces. The legacy command `[:SENSe]:AVERage[:STATe] ON|OFF|1|0` was used to turn Averaging on or off In X-Series, Averaging is turned on or off on a per-trace basis, so it can be on for one trace and off for another For backwards compatibility, the old global Average State variable is retained solely as a legacy variable, turned on and off and queried by the legacy command `[:SENSe]:AVERage[:STATe] OFF|ON|0|1.` When Average is turned on, any trace in Clear/Write will get put into Average. While Average is on, any trace put into Clear/Write by the old `:TRAC:MODE` command will instead get put into Average. When Average is turned off, any trace in Average will get put into Clear/Write

Trace Type Details

Clear/Write

Each trace update replaces the old data in the trace with new data.

Pressing **Clear/Write** for the selected trace, or sending `:TRAC:TYPE WRIT` for the specified trace, sets the trace type to **Clear/Write** and clears the trace, even if you are already in **Clear/Write**. Then a new sweep is initiated. Trigger conditions must be met before the sweep actually starts, and if in **Single** the sweep won't start until **Restart** is pressed.

Pressing **Clear/Write** stops the current sweep and initiates a new one, so **Trace Average, Max Hold** and **Min Hold** data may be interrupted in mid-sweep when **Clear/Write** is pressed, and therefore may not accurately reflect the displayed count. Therefore, when **Clear/Write** is pressed for one trace, **Trace Average, Max Hold** and **Min Hold** must restart for all traces.

When in **Clear/Write**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), a new sweep is initiated but the trace is not cleared.

Trace Average

The instrument maintains and displays an average trace, which represents the cumulative average on a point-by-point basis of the new trace data and previous averaged trace data.

Pressing **Trace Average** (for the selected trace), or sending `:TRAC:TYPE AVER` (for the specified trace), sets the trace type to **Trace Average**, clears the trace, initiates a new sweep, and restarts the Average sequence.

Details of the count limiting behavior and the averaging calculations may be found under **Avg|Hold Number** and **Average Type** under **Meas Setup.**

When in **Trace Average**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like Center Frequency or Attenuation), the average restarts and a new sweep is initiated but the trace is not cleared.

Restarting the average means:

- The average/hold count k is set to 1, so that the next time the average trace is displayed it simply represents one trace of new data
- A new sweep is initiated

- Once the new sweep starts, the trace is overwritten with current trace data as the first trace of the new average

Remember that restarting averaging also restarts **Max Hold** and **Min Hold**, as there is only one count for Trace Average and Hold.

Max Hold

The instrument maintains and displays a max hold trace, which represents the maximum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under **Meas Setup.**

Pressing **Max Hold** for the selected trace, or sending `:TRAC:TYPE MAXH` for the specified trace, sets the Trace Type to **Max Hold,** clears the trace , initiates a new sweep, and restarts the hold sequence, even if you are already in **Max Hold**.

When in **Max Hold**, if a measurement-related instrument setting is changed(that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Max Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Max Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the max hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated.

Remember that restarting **Max Hold** also restarts averaging and **Min Hold**, as there is only one count for Trace Average and Hold.

Min Hold

The instrument maintains and displays a min hold trace, which represents the minimum data value on a point-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under the **Meas Setup** functions.

Pressing **Min Hold** for the selected trace, or sending `:TRAC:TYPE MINH` for the specified trace, sets the Trace Type to **Min Hold,** clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Min Hold**.

When in **Min Hold**, if a measurement-related instrument setting is changed(that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Min Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Min Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the min hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated

Remember that restarting **Min Hold** also restarts **Max Hold** and averaging, because there is only one count for Trace Average and Hold.

Clear and Write | Restart Averaging | Restart Max/Min Hold

Starts the trace writing, as though the "Trace Type" on page 2137 had just been selected. The effect is exactly the same as reselecting the current **Trace Type** again – the control is provided because it may not be obvious that reselecting the same selection from a radio button menu will take any action.

This control displays different labels, depending on the selected Trace Type:

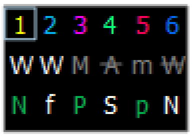
- **Clear/Write**: Clear and Write
- **Trace Average**: Restart Averaging
- **Max Hold**: Restart Max Hold
- **Min Hold**: Restart Min Hold

View/Blank

Lets you set the state of the two trace variables: **Update** and **Display**. The choices available in this dropdown menu are:

Active	Update and Display both ON
View	Update OFF; Display ON
Blank	Update OFF; Display OFF
Background	Update ON, Display OFF Allows a trace to be blanked *and* continue to update "in the background", which was not possible in the past

In the Swept SA measurement, a trace with **Display**OFF is indicated by a strikethrough of the type letter in the trace annotation panel in the Measurement Bar. A trace with **Update**OFF is indicated by dimming the type letter in the trace annotation panel in the Measurement Bar. In the example below, Traces 3, 4, 5 and 6 have **Update**OFF, and Traces 4 and 6 have **Display**OFF.



See: "More Information" on page 1144

Notes	For the commands to control the two variables, Update and Display, see "Trace Update State On/Off" on page 1143 and "Trace Display State On/Off" on page 1143 below
Dependencies	When Signal ID is on, this key is grayed-out
Couplings	Selecting a Trace Type for a trace (pressing the key or sending the equivalent command) puts the trace in **Active** (Update `ON` and Display `ON`), even if that trace type was already selected Selecting a detector for a trace (pressing the key or sending `[:SENS]:DET:TRAC`) puts the trace in **Active** (**Update**`ON` and **Display**`ON`), even if that detector was already selected Selecting a "Math Function" on page 1145 other than `OFF` for a trace (pressing the key or sending the equivalent command) puts the trace in **Active** (**Update**`ON` and **Display**`ON`), even if that Math Mode was already selected Loading a trace from a file puts that trace in **View** regardless of the state it was in when it was saved; as does being the target of a **Copy** or a participant in an **Exchange**

Trace Update State On/Off

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe[1]|2|…|6:UPDate[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|…|6:UPDate[:STATe]?`
	For all other measurements:
	`:TRACe[1]|2|3:<meas>:UPDate[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|3:<meas>:UPDate[:STATe]?`
	where <meas> is the identifier for the current measurement

Example	Make trace 2 inactive (stop updating): `:TRAC2:UPD 0`
Couplings	Whenever you set **Update** to `ON` for any trace, the **Display** is set to `ON` for that trace

Preset	For Swept SA Measurement (in SA Mode):
	`1|0|0|0|0|0`
	`ON` for Trace 1; `OFF` for 2–6
	For all other measurements:
	`1|0|0`
	`ON` for Trace 1; `OFF` for 2 &3

State Saved	Saved in instrument state

Trace Display State On/Off

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe[1]|2|…|6:DISPlay[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|…|6:DISPlay[:STATe]?`
	For all other measurements:

<table>
<tr><td></td><td><code>:TRACe[1]|2|3:<meas>:DISPlay[:STATe] ON | OFF | 1 | 0</code>
<code>:TRACe[1]|2|3:<meas>:DISPlay[:STATe]?</code>
where <meas> is the identifier for the current measurement</td></tr>
<tr><td>Example</td><td>Make trace 1 visible:
<code>:TRAC2:DISP 1</code>
Blank trace 3:
<code>:TRAC3:DISP 3</code></td></tr>
<tr><td>Couplings</td><td>Whenever you set Update to ON for any trace, the Display is set to ON for that trace</td></tr>
<tr><td>Preset</td><td>For Swept SA Measurement (in SA Mode):
<code>1|0|0|0|0|0</code>
ON for Trace 1; <code>OFF</code> for 2–6
For all other measurements:
<code>1|0|0</code>
ON for Trace 1; <code>OFF</code> for 2 &3</td></tr>
<tr><td>State Saved</td><td>Saved in instrument state</td></tr>
</table>

More Information

When a trace becomes inactive, any update from the `:SENSe` system (detectors) immediately stops, without waiting for the end of the sweep. The trace data remains unchanged, but stops updating. If the trace is blanked, this still does not affect the data in the trace. Traces that are blanked (**Display**=`OFF`) do not display nor appear on printouts, but their data stays intact, they may be queried, and markers may be placed on them

In most cases, inactive traces are static and unchanging; however, there are cases when an inactive trace will update, specifically:

- if data is written to that trace from remote
- if trace data is loaded from mass storage
- if the trace is the target of a **Copy** or participant in an **Exchange**
- if the trace is cleared using **Clear Trace**

Inactive traces that are also being displayed (traces in **View**) are displayed at half intensity. Traces in **View** display across the entire X-Axis of the instrument. Their horizontal placement does not change, even if X-Axis settings subsequently are changed, although Y-Axis settings do affect the vertical placement of data.

When a trace becomes active (**Update**=ON), the trace is cleared, the average count is reset, and a new sweep is initiated.

Note that putting a trace into **Display**=`OFF` and/or **Update**=`OFF` does *not* restart the sweep and does *not* restart Averaging or Hold functions for any traces.

3.6.10.3 Math

Lets you turn on and configure Trace Math functions.

Math Function

Trace Math functions perform mathematical operations between traces and, in some cases, user-specified offsets. When in a Trace Math function, the indicated function is performed during the sweep with the math function used in place of a detector. The trace operands for the math function are set using the "Operand 1 / Operand 2" on page 1151 controls.

- See "How trace math is processed" on page 1149

Remote Command	For option details, see "Trace Math Options" on page 1147
	For Swept SA Measurement (in SA Mode):
	`:CALCulate:MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>`
	`:CALCulate:MATH? <trace_num>`
	where `<trace_num>` is any one of:
	`TRACE1|…|TRACE6`
	For all other measurements:
	`:CALCulate:<meas>:MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>`
	`:CALCulate[:<meas>]:MATH? <trace_num>`
	where:
	`<meas>` is the identifier for the current measurement, and
	`<trace_num>` is any one of:
	`TRACe1|TRACe2|TRACe3`
	Note that the format of the `TRACe<n>` parameter differs from that for the Swept SA Measurement

Example	`:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0`
	Sets Trace 3 to Power Diff trace math function, and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2
	`:CALC:MATH TRACE3,PSUM,TRACE1,TRACE2,0,0`
	Sets Trace 3 to Power Sum trace math function and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2
	`:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`

	Sets Trace 3 to Log Offset trace math function, sets the First Trace operand (for Trace 3) to Trace 1, leaves the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and sets the Log Offset (for Trace 3) to -6 dB
	`:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00`
	Sets Trace 3 to Log Diff trace math function, sets the First Trace operand (for Trace 3) to Trace 1, sets the Second Trace operand (for Trace 3) to Trace 2, and sets the Log Difference reference (for Trace 3) to -6 dBm
	`:CALC:MATH TRACE1,OFF,TRACE2,TRACE3,0,0`
	Turns off trace math for trace 1

Notes	The Trace Math Function command has 6 main set of parameters:
	- Set 1 defines the "result trace":
	`TRACE1|…|TRACE6`
	-Set 2 defines the "function":
	`PDIFference|PSUM|LOFFset|LDIFference|OFF`
	- Set 3 is a "trace operand" (1):
	`TRACE1|…|TRACE6`
	- Set 4 is a "trace operand" (2):
	`TRACE1|…|TRACE6`
	- Set 5 defines the "Log Offset" (in dB)
	- Set 6 defines the "Log Difference Reference" (in dBm)
	Note that the trace math mode is an enumeration; that is, when a math function is set for a trace, it turns off any math function that is on for that trace, then sets the new math function
	The parameters sent in the command are reflected in the values in the control menu. There is no default for any parameter; all 6 parameters must be sent to satisfy the parser. Failure to specify a parameter will result in a missing parameter message
	The query returns the math mode, the operand traces, the offset and the reference for the specified trace, all separated by commas

Dependencies	Trace Math is not available if **Normalize** is on Trace Math is not available if Signal ID is on None of the trace operands can be the destination trace. If any of the three trace math commands is sent with a destination trace number matching one of the operands, a warning is generated and the function does not turn on
Couplings	When a math function is changed for a trace, that trace is set to Display = `ON`; and Update = `ON`

Preset	For Swept SA Measurement (in SA Mode):
	`OFF,TRACE5,TRACE6,0,0 | OFF,TRACE6,TRACE1,0,0 | OFF,TRACE1,TRACE2,0,0 | OFF,TRACE2,TRACE3,0,0 | OFF,TRACE3,TRACE4,0,0 | OFF,TRACE4,TRACE5,0,0`
	For all other measurements:
	`OFF,TRACE2,TRACE3,0,0 | OFF,TRACE3,TRACE1,0,0 | OFF,TRACE1,TRACE2,0,0`

State Saved	The trace math function for each trace is saved in instrument state
Annunciation	An "f" is shown on the trace annunciation panel in the Measurement Bar when a math function is on;

	and the function is annotated on the trace if Trace Annotation is on
Status Bits/OPC dependencies	`*OPC` can be used to detect the completion of a sweep, which will also correspond to the completion of the math operation, since all math takes place during the sweep

Trace Math Options

IMPORTANT

To generate a trace math result, *you must take a sweep*. The trace math engine, described below, operates in concert with the sweep engine in the instrument. Until a sweep has been taken, even if the constituent traces are not in Update mode, no result is generated.

Note that certain events can affect the trace in ways that affects all points at once. This can happen in any number of ways, including:

- A trace clear taking place
- A trace being loaded from the file system
- Trace data being sent in from the remote interface
- A copy or exchange of trace data

You should try to avoid these occurrences during a sweep, as they will tend to invalidate the math result being accumulated.

The Trace Math functions are:

Power Diff (Op1 - Op2)

Calculates a power difference between the `First Trace` operand and the `Second Trace` operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace:

```
DestinationTrace = 10 log(10(1/10)(FirstTrace) – 10(1/10)(SecondTrace))
```

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in `FirstTrace` is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

Otherwise, if the result of the subtraction is less than or equal to 0, the resultant point is `mintracevalue`.

Power Sum (Op1 + Op2)

Calculates a power sum between the `First Trace` operand and the `Second Trace` operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

```
DestinationTrace = 10 log(10(1/10)(FirstTrace) + 10(1/10)(SecondTrace))
```

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in either trace operand is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

Log Offset (Op1 + Offset)

Calculates a log offset from the `First Trace` operand and puts the result in the destination trace. This is like the B-DL function in some older instruments. The offset is entered on the `Offset` control, which only appears when this math function is in force for the selected trace. Each destination trace has its own offset.

During the sweep, the following formula is executed for each point in the trace operand, and the corresponding point is generated for the destination trace.

```
DestinationTrace = FirstTrace + Offset
```

The values of the trace points are assumed to be in dBm (as they are internally stored) and the offset is in dB.

If a point in the trace operand is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

If a point in the trace operand is equal to `mintracevalue`, the resultant point is also `mintracevalue`.

Example: If offset is 25 dB, then our destination trace will be higher than the operand trace by 25 dB.

Note that the `Second Trace` operand is not used for this function.

Log Diff (Op1 - Op2 + Ref)

Offsets the difference between the `First Trace` operand and the `Second Trace` operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

Offsets the difference between the `First Trace` operand and the `Second Trace` operand by a reference and puts the result in the destination trace. This is like the A-

B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

`DestinationTrace = (FirstTrace - SecondTrace) + Reference`

The values of the operand trace points are assumed to be in decibel units (as they are internally stored) and the reference is in dBm so the result is in dBm.

Example: If the first operand trace 1 is at 5 dBm, the second operand trace 2 is at –5 dBm, and the reference is –25 dBm, then the destination trace will be –15 dBm.

Example: If the first operand trace1 is at 60 dBuV, the second operand trace 2 is at 50 dBuV, and the reference is 35 dBuV, then the destination trace will be 45 dBuV.

If a point in `FirstTrace` is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

If a point in `FirstTrace` is equal to `mintracevalue`, the resultant point is also `mintracevalue`.

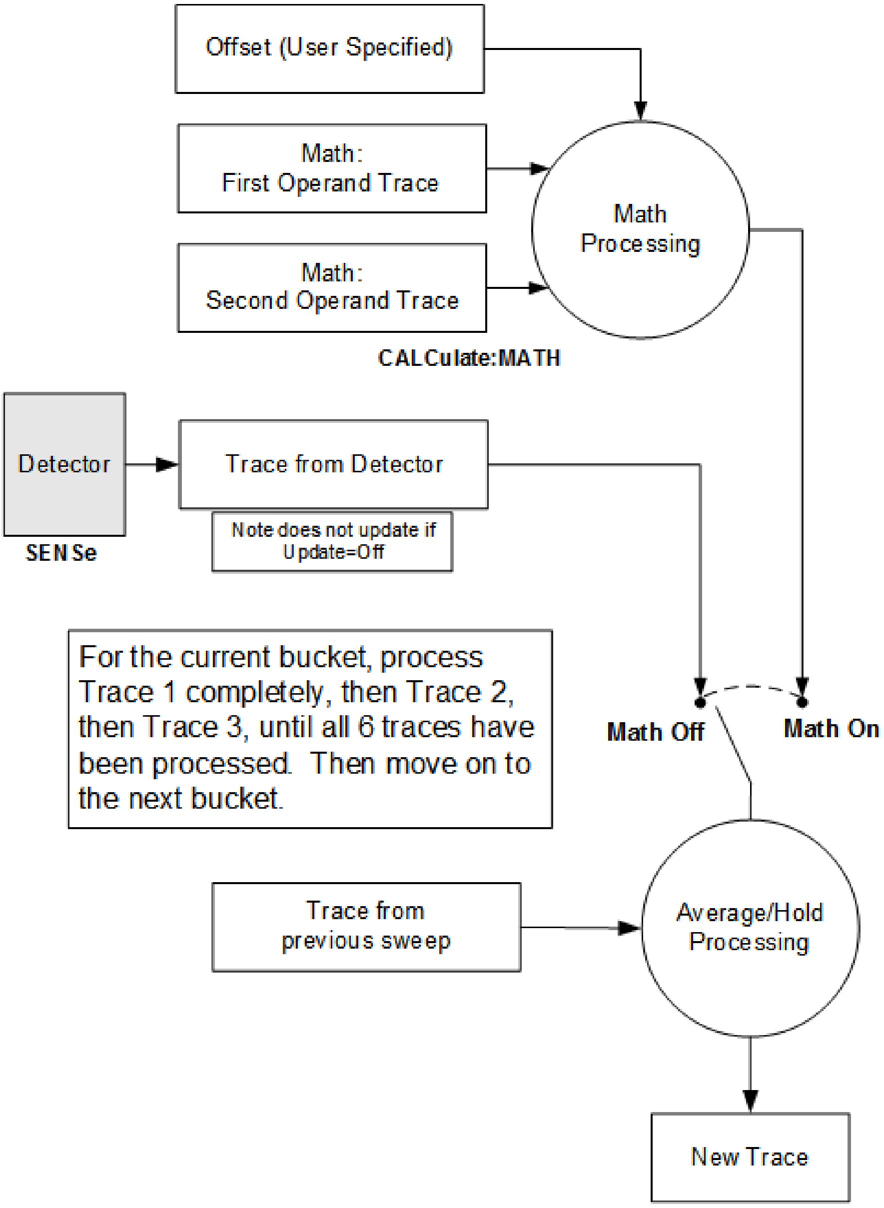
If neither of the above is true for a given point, then:

- If that point in `SecondTrace` is equal to `maxtracevalue`, the resultant point is `mintracevalue`.
- If that point in `SecondTrace` is equal to `mintracevalue`, the resultant point is `maxtracevalue`.

How trace math is processed

Whenever a trace math function is turned on, or the parameters and/or operands of an existing trace math function are changed, the destination trace is cleared. After the trace is cleared, all x-axis values in the trace, and the domain of the trace, are set to match the X-Axis settings of the first trace operand. When this is complete, a new sweep is initiated.

The process of acquiring data, processing it using the math and Average/Hold functions, and presenting it as trace data, consists of several functional blocks, as shown below:



NOTE ABOUT OFFSETS: When either External Gain or Ref Level Offset is on, an offset is applied to the trace operands, and when Trace Math is on this offset is applied before any math processing is performed. Since the operands have already been offset the result trace should NOT be offset. Therefore when any Trace Math operation is performed, the sum of (External Gain - Ref Level Offset) is added to the result before it is stored in the result trace.

For each active trace, the current trace point is processed for `Trace 1`, then `Trace 2`, then `Trace 3`, etc. Trace data is taken from either the detector for that trace, or

from the mathematical result of up to two other traces and an offset, depending on whether trace math is on or not. The resultant data is then fed to the Average/Hold processing block, where (if the trace type is **Average**, **Max Hold**, or **Min Hold**) it is processed with previous trace data. The new trace data resulting from this process is then available for display, storage or remote output.

When the processing is complete for `Trace 1`, `Trace 2` is processed, and so on until all six traces have been processed. This allows a downstream trace to use as one of its math components a fully processed upstream trace. In other words, if math is `ON` for `Trace 4`, and its operand traces are `Trace 2` and `Trace 3`, then all detector, math, average and hold processing for Traces 2 and 3 is completed before the math is performed for `Trace 4`. When the current trace point is completed for all traces, the instrument moves on to the next trace point.

This allows very flexible and powerful math functions to be configured. For example, `Trace 1` can be an average trace, which can be fed with an offset to `Trace 2`, which can also be in **Max Hold**, allowing you to obtain the **Max Hold** of an Average trace.

Note that none of this processing is performed on inactive traces.

Note also that for any active trace with math `ON`, the Operand traces should have *lower* numbers than the trace (for example, using `Trace 4` as an operand for `Trace 1` will cause the data coming from `Trace 4` to be delayed by one sweep).

Operand 1 / Operand 2

These two controls select the first and second trace operands to be used for the trace math functions for the destination trace. The operands are common to all math functions for a given trace. The most recently sent `:CALCulate:MATH` command for a given trace sets the operands for that trace. Those settings are displayed on the trace operand controls for that trace.

Example	The following examples are for the Swept SA measurement
	Set Trace 3 to Power Diff trace math function. Set the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2:
	`:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0`
	Set Trace 3 to Log Offset trace math function. Set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB:
	`:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`

Notes	See "Math Function" on page 1145 for how to specify Operands 1 and 2 using `:CALCulate:MATH`
Dependencies	The destination trace cannot be an operand. The destination trace number is grayed-out on the dropdown
Preset	Operand 1: Trace number minus 2 (wraps at 1). For example, for Trace 1, Operand 1 presets to Trace

	5; for Trace 6, it presets to Trace 4 Operand 2: Trace number minus 1 (wraps at 1). For example, for Trace 1, Operand 2 presets to Trace 6; for Trace 6, it presets to Trace 5
State Saved	Operands 1 and 2 for each trace are stored in instrument state

Offset

Used by the Log Offset math function.

Example	The following example is for the Swept SA measurement Set Trace 3 to Log Offset trace math function, set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB: `:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`
State Saved	The Log Offset value for each trace is saved in Instrument State
Min	–100 dB
Max	100 dB

Reference

Used by the Log Diff math function.

Example	The following example is for the Swept SA measurement Set Trace 3 to Log Diff trace math function, set the First Trace operand (for Trace 3) to Trace 1, set the Second Trace operand (for Trace 3) to Trace 2, and set the Log Difference reference (for Trace 3) to -6 dBm: `:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00`
State Saved	The Log Difference reference value for each trace is saved in instrument state
Min/Max	Same as reference level

3.6.10.4 Trace Function

Contains controls to:

- Copy and Exchange traces
- Preset or Clear all traces

From Trace

Selects the trace to be copied to or exchanged with the "To Trace" on page 1153 when a "Copy" on page 1153 or "Exchange" on page 1154 is performed

Preset	1

To Trace

Selects the trace to be copied from or exchanged with the "From Trace" on page 1153 when a "Copy" on page 1153 or "Exchange" on page 1154 is performed

Preset	2

Copy

Executes a Trace Copy based on the "From Trace" on page 1153 and "To Trace" on page 1153 parameters. The copy operation is from the **From Trace** to the **To Trace**. The action is performed once.

The X-Axis settings and domain of a trace are also copied.

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe:COPY TRACE1 | … | TRACE6, TRACE1 | … | TRACE6`
	For all other measurements:
	`:TRACe:<meas>:COPY TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
	where `<meas>` is the identifier for the current measurement
	Note that the format of the `TRACe<n>` parameter differs from that for the Swept SA Measurement

Example	Copy Trace 1 to Trace 3 and put Trace 3 in Update=Off, Display=On `:TRAC:COPY TRACE1,TRACE3`
Notes	The command is of the form: `:TRACe:COPY <source_trace>,<dest_trace>`
Dependencies	When Signal ID is on, this key is grayed-out
Couplings	The destination trace is put in **View** (Update = Off, Display = On) after the copy

Preset	For Swept SA Measurement (in SA Mode):
	`TRACE1, TRACE2`
	For all other measurements:
	`TRACe1, TRACe2`

Exchange

Executes a Trace Exchange based on the "From Trace" on page 1153 and "To Trace" on page 1153 parameters. The **From Trace** and **To Trace** values are exchanged with each other. The action is performed once.

The X-Axis settings and domain of a trace are also copied when it is exchanged with another trace.

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe:EXCHange TRACE1 | … | TRACE6, TRACE1 | … | TRACE6`
	For all other measurements:
	`:TRACe:<meas>:EXCHange TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
	where `<meas>` is the identifier for the current measurement
	Note that the format of the `:TRACe<n>` parameter differs from that for the Swept SA Measurement

Example	Exchange Trace 1 and Trace 2 and put both traces in Update=`OFF`, Display=`ON`: `:TRAC:EXCH TRACE1,TRACE2`
Notes	The command is of the form: `:TRACe:EXCHange <trace_1>,<trace_2>`
Couplings	Both traces are put in **View** (Update=Off, Display=On) after the exchange

Preset All Traces

Turns on Trace 1 and blanks all other traces. This is useful when you have many traces on and you want to return to having only Trace 1 on the display. Does not affect the trace type, detector or any other aspect of the trace system.

Remote Command	`:TRACe[:<meas>]:PRESet:ALL`
Example	`:TRAC:PRES:ALL`
Dependencies	When Signal ID is on, this key is grayed-out

Clear All Traces

Clears all traces. Does not affect the state of any function or variable in the instrument. Loads `mintracevalue` into all of the points for all traces, except traces in **Min Hold**, in which case it loads `maxtracevalue`, even if **Update** = `OFF`.

Remote Command	`:TRACe[:<meas>]:CLEar:ALL`
Example	`:TRAC:CLE:ALL`
Dependencies	When Signal ID is on, this key is grayed-out

3.6.10.5 Advanced

Contains controls for setting advanced trace functions of the instrument.

Measure Trace

Specifies which trace’s scalar results are displayed in the **Metrics** window, and retrieved by sending a `:READ` or `:FETCh` query:

- Trace 1
- Trace 2
- Trace 3

Remote Command	`:CALCulate:<meas>:MTRace TRACe1 | TRACe2 | TRACe3`
	`:CALCulate:<meas>:MTRace?`
	`<meas>` is the identifier for the current measurement; any one of `CHPower | ACPower | OBWidth | SEMask | SPURious | PVTime`

Example	Channel Power
	`:CALC:CHP:MTR TRAC1`
	`:CALC:CHP:MTR?`

Dependencies	In the ACP measurement, this control is grayed-out when **Meas Method** is set to `RBW` or `FAST`, and only Trace 1 is enabled
Preset	`TRACe1`
State Saved	No
Range	Trace 1 | Trace 2 | Trace 3

3.7 Transmit On|Off Power Measurement

This measurement is designed for testing Transmit On/Off Power for the E-UTRA TDD BS, E-UTRA FDD UE and E-UTRA TDD UE.

When Direction is Downlink, two key results will be provided, one is transmitter OFF power and the other is transmitter transient period. The definition for the two results are as below according to TS36.141:

- Transmitter OFF power is defined as the mean power measured over 70 us filtered with a square filter of bandwidth equal to the transmission bandwidth configuration of the BS (BWConfig) centered on the assigned channel frequency during the transmitter OFF period. The minimum requirement for transmitter OFF power spectral density shall be less than -82.5dBm/MHz
- The transmitter transient period is the time period during which the transmitter is changing from the OFF period to the ON period or vice versa. The transmitter transient period is illustrated in figure below,

When Direction is Uplink, three key results will be provided to ensure that the UE’s transmitter is comply with the ON/OFF time mask defined in TS36.521, following 3 results will be provided.

- Transmission OFF power during the sub-frame prior to the active subframe.
- Output power of the UE transmission during the active subframe
- Transmission OFF power during the sub-frame following the active subframe

More Information

When Direction is Downlink, two key results will be provided, one is transmitter OFF power and the other is transmitter transient period. The definition for the two results are as below:

- Transmitter OFF power is defined as the mean power measured over 70 us filtered with a square filter of bandwidth equal to the transmission bandwidth configuration of the BS (BWConfig) centered on the assigned channel frequency during the transmitter OFF period. The minimum requirement for transmitter OFF power spectral density shall be less than -85dBm/MHz
- The transmitter transient period is the time period during which the transmitter is changing from the OFF period to the ON period or vice versa. The transmitter transient period is illustrated in figure below

For averaged measurements, the user may specify the number of sweeps over which to average the result. This means that for an average number of 10, the power results are obtained from each trace, converted to linear (voltage squared), and then averaged with the previous average result before being displayed. The running average count and (the log of) the true averaged linear power will be displayed after each measurement sweep.

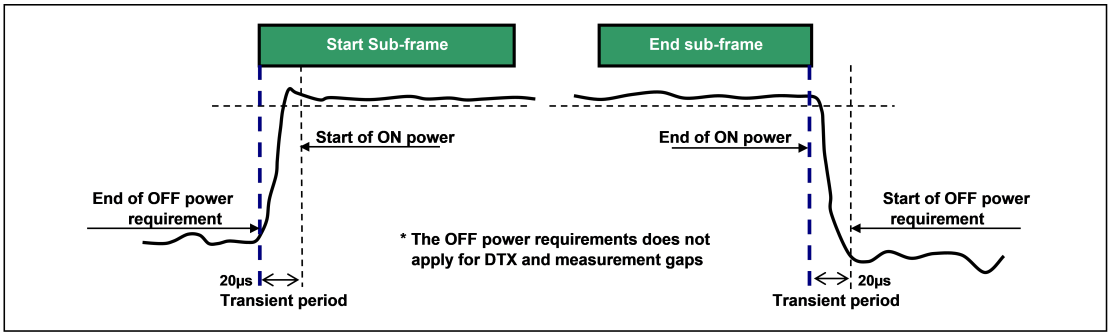
When Direction is Uplink, three key results will be provided to ensure that the UE's transmitter is comply with the ON/OFF time mask defined in TS36.521 6.3.4.

- Transmission OFF power during the sub-frame prior to the active subframe.
- Output power of the UE transmission during the active subframe
- Transmission OFF power during the sub-frame following the active subframe.

The transmit OFF power is defined as the mean power in a duration of at least one sub-frame (1ms) excluding any transient periods. The requirement for the transmit OFF power shall not exceed the -50dBm, the measurement bandwidth is listed below:

	Channel bandwidth / OFF power measurement bandwidth					
	1.4 MHz	3.0 MHz	5 MHz	10 MHz	15 MHz	20 MHz
Measurement bandwidth	1.08 MHz	2.7 MHz	4.5 MHz	9.0 MHz	13.5 MHz	18 MHz

The ON power is defined as the mean power over one sub-frame excluding any transient period.



Following ON/OFF time masks are supported:

- General ON/OFF time mask
- PRACH ON/OFF time mask
- Single SRS time mask
- Dual SRS time mask for the case of UpPTS transmissions

The OFF Power prior to the active burst is measured according to TS36.521-1 , the measurement period is defined as below: The measurement period for OFF Power following the active burst is 1 frame excluding 20 us transient period, which is 980us in all cases.

	Measurement Period for the OFF Power Prior to Active Burst	
	FDD	TDD
General ON/OFF time mask	1ms	When the subframe prior to the active subframe is special subframe, the DwPTS part plus one symbol will be excluded, other case will be 1ms.
PRACH ON/OFF time mask	980us	When the preamble format 4 is under test, the DwPTS part plus one symbol will be excluded, the fact that the nominal PRACH timing for TDD format 4 is not aligned with the subframe and symbol raster is considered. Other case will be 980us.
Single SRS time mask	13 symbols preceding the SRS symbol	13 symbols preceding the SRS symbol if SRS is not transmitted in the UpPTS; otherwise, will be all the symbols in the same subframe preceding the SRS symbol excluding DwPTS part plus one symbol.
Dual SRS time mask	Not supported	All the symbols in the same subframe preceding the two SRS symbols excluding DwPTS part plus one symbol. Only support special subframe configurations with UpPTS lengths 4384Ts and 5120 Ts only.

Burst Type	ON power measurement period
PUSCH	0.980ms when transmitted only in one subframe
PRACH preamble format 0	0.9031ms
PRACH preamble format 1	1.4844ms
PRACH preamble format 2	1.8031ms
PRACH preamble format 3	2.2844ms
PRACH preamble format 4	0.1479ms

Single SRS	1 symbol minus 20us
Dual SRS	If there is frequency hopping or a power change between SRS symbols, the On period will be discontinuous, 20us at the end of the first symbol and another 20us at the start of the second symbol will be excluded, otherwise, it will be 2 symbol time minus 20 us.

This topic contains the following sections.

Remote Commands for Transmit On|Off Power

The following commands are used to retrieve the measurement results.

You must be in the LTE & LTE-A TDD or LTE & LTE-A FDD mode to use these commands.

`:CONFigure:PVTime`

`:CONFigure:PVTime:NDEFault`

`:INITiate:PVTime`

`:FETCh:PVTime[n]?`

`:READ:PVTime[n]?`

`:MEASure:PVTime[n]?`

Measurement Results for Transmit On|Off Power Measurement

For each result, the following heading is used to represent its format and precision.

#. Result Name (type of number) [unit] <explanation>

Type of number includes double, float and integer.

Index n	Results Returned
0	Returns unprocessed I/Q trace data as a series of comma-separated trace point values, in volts. The I values are listed first in each pair, using 0 through the even-indexed values. The Q values are odd-indexed values.
n=1 (or not specified)	Returns the following comma-separated scalar results: 1. Sample time is a floating point number representing the time between samples of displayed trace which you can get by using the trace queries (n=2, 3, ...). 2. Number of samples is the number of data points in the displayed trace. This number is useful when performing a query on the signal (i.e. when n=2, 3 ...). For VXT models M9410A/11A, only an even number of samples is supported, and samples will be clipped if it this number is odd. 3. On Power/ Mean Power of First SRS Symbol is the mean power (in dBm) of the active part in the range specified by Analysis Time Slot and Measured Time Slots

Index n	Results Returned
	in the most recently acquired data, or in the last data acquired at the end of a set of averages. For LTETDD, When Direction is Uplink and Measure Dual SRS is selected, this result will be the mean power of the first SRS symbol. 4. Burst width is the width of the first set of continuous active slots in the range specified by Analysis Time slot and Measured Time Slots. 5. Trigger Diff is the time difference between the position of the trigger line and the start point of the start slot specified by Analysis Time Slot. 6. Ramp up time is the time difference between 10% and 90% voltage points (relative to peak) on the positive slope of the burst, here burst has the same meaning in Burst width. 7. Ramp down time is the time difference between 90% and 10% voltage points (relative to peak) on the negative slope of the burst, here burst has the same meaning in Burst width. 8. Off power/Off power before is the mean power measured during the transmitter OFF period, When Direction is Uplink, and this result is the OFF power during the sub-frame prior to the active subframe. 9. Maximum power is the maximum peak level in the range specified by Analysis Time Slot and Measured Time Slots (in dBm). 10. Minimum power is the minimum peak level in the range specified by Analysis Time Slot and Measured Time Slots (in dBm). 11. Actual sample time is the a floating point number representing the time between samples of uncompressed I/Q trace data, which could be get by using trace query(n=0). 12. Actual number of samples is the number of data points in the uncompressed I/Q trace data, which could be get by using trace query(n=0). 13. Off power after this result is Uplink only. It is the OFF power during the sub-frame following the active subframe. When Direction is not Uplink, the value will be NaN (9.91 E 37). 14. Mean Power of Second SRS Symbol. For LTETDD, When Direction is Uplink and Measure Dual SRS is selected, this result will be the mean power of the second SRS symbol. When Direction is not Uplink and Meas DualSRS is not selected, the value will be NaN (9.91 E 37).
2	Measured Trace data This returns comma-separated floating point numbers representing the Measured Trace data (in dBm).
3	Measured Max Hold Trace data This returns comma-separated floating point numbers representing the Measured Max Hold Trace data (in dBm).
4	Measured Min Hold Trace data

Index n	Results Returned
	This returns comma-separated floating point numbers representing the Measured Min Hold Trace data (in dBm).
5	Averaged absolute power of the slots This returns at most 20 comma-separated float values representing the averaged absolute power of each time slot (in dBm). For the inactive slot, the value will be NaN (9.91 E 37).. 1. Averaged absolute power of TS0 2. Averaged absolute power of TS1 3. Averaged absolute power of DwPTS 4. Averaged absolute power of UpPTS 5. Averaged absolute power of TS4 6. Averaged absolute power of TS5 7. Averaged absolute power of TS6 8. Averaged absolute power of TS7 9. Averaged absolute power of TS8 10. Averaged absolute power of TS9 11. Averaged absolute power of TS10 12. Averaged absolute power of TS11 13. Averaged absolute power of TS12 (if the Uplink-downlink configuration indicates it is 5ms periodicity, it is 2nd DwPTS) 14. Averaged absolute power of TS13(if the Uplink-downlink configuration indicates it is 5ms periodicity, it is 2nd UpPTS) 15. Averaged absolute power of TS14 16. Averaged absolute power of TS15 17. Averaged absolute power of TS16 18. Averaged absolute power of TS17 19. Averaged absolute power of TS18 20. Averaged absolute power of TS19
6	Width of the slots This returns 20 comma-separated float values representing the width of each time slot (in us). For the inactive slot, the value will be NaN(9.91E37).

Index n	Results Returned
	1. Active signal width of TS0 2. Active signal width of TS1 3. Active signal width of DwPTS 4. Active signal width of UpPTS 5. Active signal width of TS4 6. Active signal width of TS5 7. Active signal width of TS6 8. Active signal width of TS7 9. Active signal width of TS8 10. Active signal width of TS9 11. Active signal width of TS10 12. Active signal width of TS11 13. Active signal width of TS12 (if the Uplink-downlink configuration indicates it is 5ms periodicity, it is 2nd DwPTS) 14. Active signal width of TS13(if the Uplink-downlink configuration indicates it is 5ms periodicity, it is 2nd UpPTS) 15. Active signal width of TS14 16. Active signal width of TS15 17. Active signal width of TS16 18. Active signal width of TS17 19. Active signal width of TS18 20. Active signal width of TS19
7	Averaged absolute power of the subframes This returns 10 comma-separated float values, for active subframe, it represents mean power (in dBm) of each subframe excluding any transient time, for inactive subframe, it represents the OFF power. For subframes not included in the specified measure interval, the value will be NaN(9.91E37). For special subframes in LTETDD, when Direction is Downlink, it will be the mean power in DwPTS, when Direction is Uplink, it will be the mean power of UpPTS. 1. Averaged absolute power of Subframe 0 2. Averaged absolute power of Subframe 1

Index n	Results Returned
	3. Averaged absolute power of Subframe 2 4. Averaged absolute power of Subframe 3 5. Averaged absolute power of Subframe 4 6. Averaged absolute power of Subframe 5 7. Averaged absolute power of Subframe 6 8. Averaged absolute power of Subframe 7 9. Averaged absolute power of Subframe 8 10. Averaged absolute power of Subframe 9
8	Averaged Width of the subframes This returns 10 comma-separated float values representing burst width (in us) of each subframe. For special subframes in LTETDD, when Direction is Downlink, it will be the burst width of DwPTS, when Direction is Uplink, it will be the burst width of UpPTS. For the inactive subframe, the value will be NaN(9.91E37) 1. Active signal width of Subframe 0 2. Active signal width of Subframe 1 3. Active signal width of Subframe 2 4. Active signal width of Subframe 3 5. Active signal width of Subframe 4 6. Active signal width of Subframe 5 7. Active signal width of Subframe 6 8. Active signal width of Subframe 7 9. Active signal width of Subframe 8 10. Active signal width of Subframe 9
9	Measured 70us RMS Trace (dBm/MHz) data This returns comma-separated floating point numbers representing the Measured 70us RMS Trace (dBm/MHz) data (in dBm/MHz).
10 Direction = Downlink	Returns scalar values of the pass/fail (0 = passed, or 1 = failed) determined by testing Off Power result and Ramp Up/Down results. 1. DL Off Power 2. DL Ramp Up (When Auto Timing Adjust is On) / DL Transient Ramp Up (When Auto Timing Adjust is Off)

Index n	Results Returned
	3. DL Ramp Down (When Auto Timing Adjust is On) / DL Transient Ramp Down (When Auto Timing Adjust is Off) 4. -999.0 5. -999.0 6. -999.0 7. -999.0 8. -999.0 9. -999.0 10. -999.0 The last seven results always return -999.0. The number of values returned is subject to change in future releases.
10 Direction = Uplink	Returns scalar values of the pass/fail (0 = passed, or 1 = failed) determined by testing Off Power results, Ramp Up/Down results and On Power result. 1. UL Off Power Before 2. UL Off Power After 3. UL Ramp Up 4. UL Ramp Down 5. UL On Power 6. -999.0 7. -999.0 8. -999.0 9. -999.0 10. -999.0 The last five results always return -999.0. The number of values returned is subject to change in future releases.

3.7.1 Views

The Transmit On/Off Power measurement has two views.

These Views are multiple-window Views. When in a multiple window View, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Whenever the View changes, the default menu is Frequency, unless otherwise specified in the View description.

View	String ID	Numeric ID	Window

Burst	ALL	1	RF Envelope Metrics
Rise & Fall	BOTH	2	Rise Fall Metrics

You can select the desired measurement view from the selections listed in the table below. There are two available commands, allowing you to select the view using either a string ID or a numeric ID value.

- :DISP:PVT:VIEW[:SEL] <string ID>
- :DISP:PVT:VIEW:NSEL <numeric ID>

View Selection by Name

Remote Command	`:DISPlay:PVTime:VIEW[:SELect] ALL | BOTH` `:DISPlay:PVTime:VIEW[:SELect]?`
Example	DISP:PVT:VIEW ALL DISP:PVT:VIEW?
Preset	ALL
State Saved	Saved in instrument state.
Range	Burst | Rise & Fall

View Selection by Number

Remote Command	`:DISPlay:PVTime:VIEW:NSELect <integer>` `:DISPlay:PVTime:VIEW:NSELect?`
Example	DISP:PVTime:VIEW:NSEL 2 DISP:PVTime:VIEW:NSEL?
Preset	1
State Saved	Saved in instrument state.
Min	1
Max	2

3.7.1.1 Burst

Windows:

- RF Envelope
- Metrics

View Burst envelope, the length of burst can be determined by slot number in mode setup.

Example	DISP:PVT:VIEW ALL

3.7.1.2 Rise&Fall

Windows:

- Rise
- Fall
- Metrics

Zooms in on the rising and falling portions of the burst being tested.

Example	DISP:PVT:VIEW BOTH

3.7.2 Windows

The following windows are available in Transmit On/Off measurement

Window	Number
RF Envelope	1
Rise	2
Fall	3
Metrics	4

3.7.2.1 RF Envelope

The RF Envelope window appears in Burst Views, as follows:

View	Size	Position
Burst	Half, full Width	Upper

3.7.2.2 Rise

The Rise window is an important component to see the Detail of power ramp up profile, it will appears in Rise&Fall view.

View	Size	Position
Rise&Fall	Half height, half width	Top Left

3.7.2.3 Fall

The Rise window is an important component to see the Detail of power ramp down profile, it will appears in Rise&Fall view.

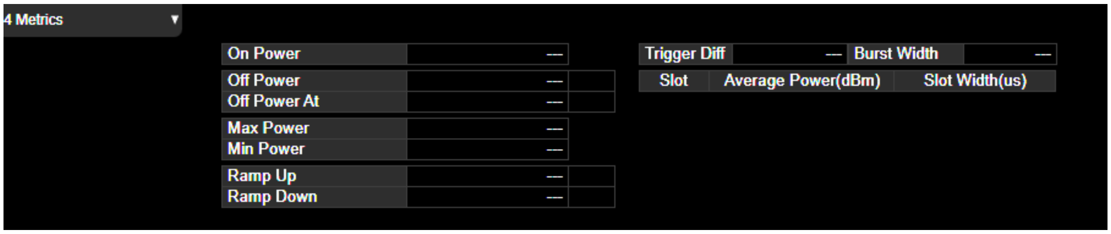
View	Size	Position
Rise&Fall	Half height, half width	Top Right

3.7.2.4 Metrics

The Metrics window is an important component to see the specific metric reported by the measurement.

View	Size	Position
Burst	Half height, full width	Bottom
Rise&Fall	Half height, full width	Bottom

This table illustrates the details of metrics window when Direction is Downlink and AutoTimingAdjustment is on:

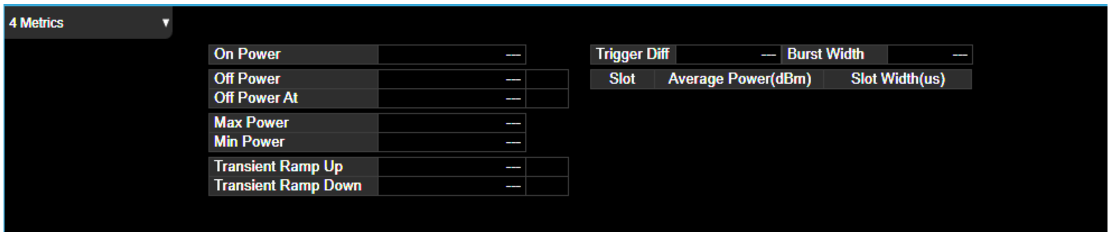


On Power	---	
Off Power	---	
Off Power At	---	
Max Power	---	
Min Power	---	
Ramp Up	---	
Ramp Down	---	

Trigger Diff	---	Burst Width	---

Slot	Average Power(dBm)	Slot Width(us)

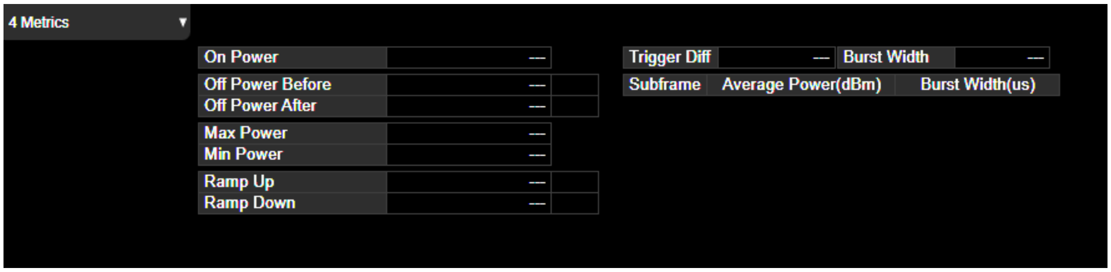
This table illustrates the details of metrics window when Direction is Downlink and AutoTimingAdjustment is off:



Name	Corresponding Results in READ:PVT	Display Format
On Power	n=1 3rd	99.999 dBm
Burst Width	n=1 4th	99.999 ms
Trigger Diff	n=1 5th	99.999 us
Ramp Up	n=1 6th	99.999 us
Ramp Down	n=1 7th	99.999 us
Off Power	n=1 8th	99.999 dBm
Max Power	n=1 9th	99.999 dBm
Min Power	n=1 10th	99.999 dBm
Slot	N/A	AAA
Avg Pwr	n=7	99.99 dBm
Slot width	n=8	99.99 us

NOTE **Slot/AvgPwr/SlotWidth section only displays measure results for active slot within display range.**

This table illustrates the details of metrics window when Direction is Uplink and Measure PRACH/SRS is NOT set to Dual SRS:

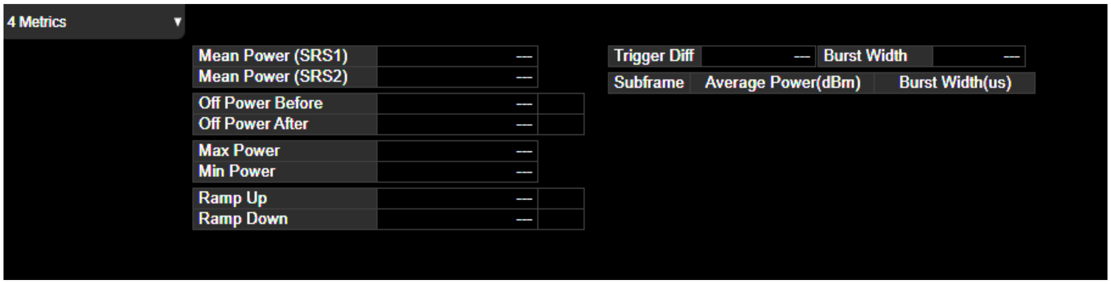


Name	Corresponding Results in READ:PVT	Display Format
On Power	n=1 3rd	99.999 dBm
Burst Width	n=1 4th	99.999 ms
Trigger Diff	n=1 5th	99.999 us

Ramp Up	n=1 6th	99.999 us
Ramp Down	n=1 7th	99.999 us
Off Power Before	n=1 8th	99.999 dBm
Off Power After	n=1 13th	99.999 dBm
Max Power	n=1 9th	99.999 dBm
Min Power	n=1 10th	99.999 dBm
Subframe	N/A	AAA
Avg Pwr	n=7	99.99 dBm
Burst width	n=8	99.99 us

Subframe/AvgPwr/SlotWidth section displays measure results for all subframes within display range.

When Direction is Uplink and Measure PRACH/SRS is set to Dual SRS, the mean power for SRS1 and SRS2 are listed separately:



4 Metrics

Mean Power (SRS1)	---
Mean Power (SRS2)	---
Off Power Before	---
Off Power After	---
Max Power	---
Min Power	---
Ramp Up	---
Ramp Down	---

Trigger Diff	---	Burst Width	---

Subframe	Average Power(dBm)	Burst Width(us)

Name	Corresponding Results	Display Format
Mean Power for SRS1	n=1 3rd	99.999 dBm
Mean Power for SRS2	n=114th	99.999 dBm
Burst Width	n=1 4th	99.999 ms
Trigger Diff	n=1 5th	99.999 us
Ramp Up	n=1 6th	99.999 us
Ramp Down	n=1 7th	99.999 us
Off Power Before	n=1 8th	99.999 dBm
Off Power After	n=1 13th	99.999 dBm
Max Power	n=1 9th	99.999 dBm
Min Power	n=1 10th	99.999 dBm
Subframe	N/A	AAA

Avg Pwr	n=7	99.99 dBm
Burst width	n=8	99.99 us

NOTE **Subframe/AvgPwr/SlotWidth section displays measure results for all subframes within display range.**

3.7.3 Amplitude

The Amplitude front-panel key activates the Amplitude menu and selects Reference Value as the active function.

3.7.3.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The reference line is at the top, center, or bottom of the graticule, depending on the value of the Ref Position function.

Remote Command	`:DISPlay:PVTime:WINDow[1]|2|3:TRACe:Y[:SCALe]:RLEVel <real>`
	`:DISPlay:PVTime:WINDow[1]|2|3:TRACe:Y[:SCALe]:RLEVel?`
	Window numbers are as follows:
	Burst: 1
	Rise: 2
	Fall: 3

Example	DISP:PVT:WIND:TRAC:Y:SCAL:RLEV 5dBm ! 1-Burst for Transmit On/Off Power DISP:PVT:WIND:TRAC:Y:SCAL:RLEV? ! 1-Burst for Transmit On/Off Power DISP:PVT:WIND2:TRAC:Y:SCAL:RLEV 5 ! 2-Rise for Transmit On/Off Power DISP:PVT:WIND3:TRAC:Y:SCAL:RLEV 5 ! 2-Fall for Transmit On/Off Power
Couplings	When Auto Scaling is On (default), this value is automatically determined by the measurement result. When you set a value manually, Auto Scaling changes to Off. Attenuation is not coupled to Ref Value.
Preset	10.00 dBm ! 1-Burst 0.00 dBm ! 2-Rise

	0.00 dBm ! 3-Fall
State Saved	Saved in instrument state
Resolution	0.01 dB
Annotation	Ref <value> top left of graph

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now the VIEW parameter is not used and defaults to 1. All Windows are referenced through VIEW1. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
PVT - Burst	:DISP:PVT:VIEW [1]:WIND:TRAC:Y:SCAL:RLEV 5dBm	:DISP:PVT:WIND1:TRAC:Y:SCAL:RLEV 5dBm
PVT – Rise	:DISP:PVT:VIEW2:WIND:TRAC:Y:SCAL:RLEV 5dBm	:DISP:PVT:WIND2:TRAC:Y:SCAL:RLEV 5dBm
PVT – Fall	:DISP:PVT:VIEW2:WIND2:TRAC:Y:SCAL:RLEV 5dBm	:DISP:PVT:WIND3:TRAC:Y:SCAL:RLEV 5dBm

Scale/Div

Scale/Div sets the height of one division of the graticule in the current Y-Axis unit.

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule division on the display, the total amplitude range of the graph is typically 10x this amount. For example, if Scale/Div is 10 dB, then the total range of the graph is 100 dB.

Remote Command	`:DISPlay:PVTime:WINDow[1]|2|3:TRACe:Y[:SCALe]:PDIVision <rel_ampl>`
	`:DISPlay:PVTime:WINDow[1]|2|3:TRACe:Y[:SCALe]:PDIVision?`
	Window numbers are as follows:
	Burst: 1
	Rise: 2
	Fall: 3

Example	DISP:PVT:WIND:TRAC:Y:PDIV 5 ! 1-Burst for Transmit On/Off Power DISP:PVT:WIND:TRAC:Y:PDIV? ! 1-Burst for Transmit On/Off Power DISP:PVT:WIND2:TRAC:Y:PDIV 10 ! 2-Rise for Transmit On/Off Power DISP:PVT:WIND3:TRAC:Y:PDIV 10 ! 3-Fall for Transmit On/Off Power
Dependencies	In measurements that support both Log and Lin scales, Scale/Div is grayed out in linear Y scale. Sending the equivalent SCPI command does change the Scale/Div, though it has no affect while in Lin.

Couplings	In measurements that support Auto Scaling, when the Auto Scaling is On, this value is automatically determined by the measurement result. When you set a value manually, Auto Scaling automatically changes to Off.
Preset	10.00 dB / Div
State Saved	Saved in instrument state
Min	0.10 dB
Max	20dB
Resolution	0.1 ! all measurements unless noted below Swept SA For values from 1-20 resolution is 1 dB For values from 0.1 to 0.9, resolution is 0.1 dB Spectrum Emission Mask, Complex Spectrum 0.01
Annotation	<value> dB/ left upper of graph ! all measurements unless noted In log scale, the Scale/Div is shown in the upper left side of the display. In Lin mode, no annotation is displayed. ! Swept SA
Status Bits/OPC dependencies	None

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now the VIEW parameter is not used and defaults to 1. All Windows are referenced through VIEW1. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
PVT - Burst	:DISP:PVT:VIEW[1]:WIND:TRAC:Y:PDIV 10	:DISP:PVT:WIND1:TRAC:Y:PDIV 10
PVT – Rise	:DISP:PVT:VIEW2:WIND:TRAC:Y:PDIV 10	:DISP:PVT:WIND2:TRAC:Y:PDIV 10
PVT – Fall	:DISP:PVT:VIEW2:WIND2:TRAC:Y:PDIV 10	:DISP:PVT:WIND3:TRAC:Y:PDIV 10

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change the reference level value.

Remote Command

```
:DISPlay:PVTime:WINDow[1]|2|3:TRACe:Y[:SCALe]:RPOSition TOP | CENTer | BOTTom
:DISPlay:PVTime:WINDow[1]|2|3:TRACe:Y[:SCALe]:RPOSition?
```

Window numbers are as follows:

Burst: 1

	Rise: 2 Fall: 3

Example	`:DISP:PVT:WIND:TRAC:Y:RPOS CENT ! 1-Burst for Transmit On/Off Power`
	`:DISP:PVT:WIND:TRAC:Y:RPOS? ! 1-Burst for Transmit On/Off Power`
	`:DISP:PVT:WIND2:TRAC:Y:RPOS CENT ! 2-Rise for Transmit On/Off Power`
	`:DISP:PVT:WIND3:TRAC:Y:RPOS CENT ! 3-Fall for Transmit On/Off Power`

Preset	TOP
State Saved	Saved in instrument state.
Range	Top|Ctr|Bot
Annotation	The greater than (>) and less than (<) symbols are displayed on both sides of the graph to indicate the Reference Position

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now the VIEW parameter is not used and defaults to 1. All Windows are referenced through VIEW1. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
PVT - Burst	:DISP:PVT:VIEW[1]:WIND:TRAC:Y:RPOS CENT	:DISP:PVT:WIND[1]:TRAC:Y:RPOS CENT
PVT – Rise	:DISP:PVT:VIEW2:WIND:TRAC:Y:RPOS CENT	:DISP:PVT:WIND2:TRAC:Y:RPOS CENT
PVT – Fall	:DISP:PVT:VIEW2:WIND2:TRAC:Y:RPOS CENT	:DISP:PVT:WIND3:TRAC:Y:RPOS CENT

Auto Scaling

Toggles the Auto Scaling function between On and Off. When Auto Scaling is On, pressing the Restart front-panel key results in automatically determining scale per division and reference values based on the measurement results.

When you set a value to either Scale/Div or Ref Value manually, Auto Scaling automatically changes to Off.

Remote Command	`:DISPlay:PVTime:WINDow[1]|2|3:TRACe:Y[:SCALe]:COUPle 0 | 1 | OFF | ON`
	`:DISPlay:PVTime:WINDow[1]|2|3:TRACe:Y[:SCALe]:COUPle?`
	Window numbers are as follows:
	Burst: 1
	Rise: 2

	Fall: 3

Example	`:DISP:PVT:WIND:TRAC:Y:COUP ON ! 1-Burst for Transmit On/Off Power`
	`:DISP:PVT:WIND:TRAC:Y:COUP? ! 1-Burst for Transmit On/Off Power`
	`:DISP:PVT:WIND2:TRAC:Y:COUP ON ! 2-Rise for Transmit On/Off Power`
	`:DISP:PVT:WIND3:TRAC:Y:COUP? ! 2-Fall for Transmit On/Off Power`

Couplings	When Auto Scaling is On, and the Restart front-panel key is pressed, this function automatically sets the scale per division to 10 dB and determines the reference values based on the measurement results. When you set a value to either Scale/Div or Ref Value manually, Auto Scaling automatically changes to Off.
Preset	1 ! Measurements other than Spot Frequency 0 ! Spot Frequency
State Saved	Saved in instrument state.
Range	On|Off

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now the VIEW parameter is not used and defaults to 1. All Windows are referenced through VIEW1. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
PVT - Burst	:DISP:PVT:VIEW[1]:WIND:TRAC:Y:COUP ON	:DISP:PVT:WIND[1]:TRAC:Y:COUP ON
PVT – Rise	:DISP:PVT:VIEW2:WIND:TRAC:Y:COUP ON	DISP:PVT:WIND2:TRAC:Y:COUP ON
PVT – Fall	:DISP:PVT:VIEW2:WIND2:TRAC:Y:COUP ON	DISP:PVT:WIND3:TRAC:Y:COUP ON

3.7.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See "Dual-Attenuator Configurations" on page 1175
- See "Single-Attenuator Configuration" on page 1176

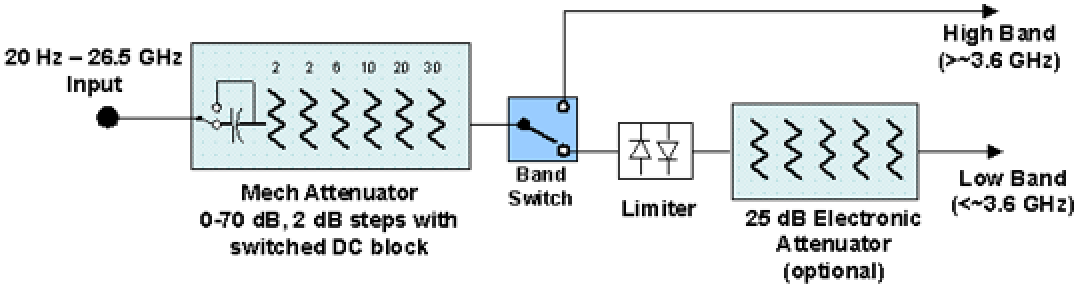
Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called "Meas Global" and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight's benchtop instruments. For example, this tab does *not* appear in VXT models M9420A/10A/11A/15A/16A, M9410E/11E/15E/16E, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

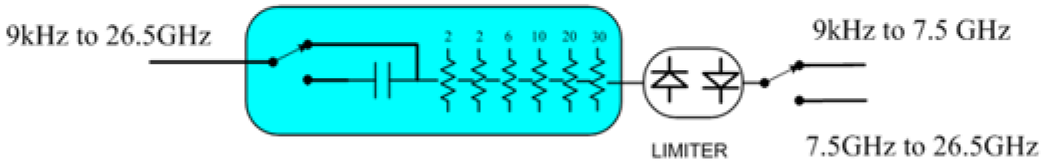
Dependencies	In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the **Range** tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

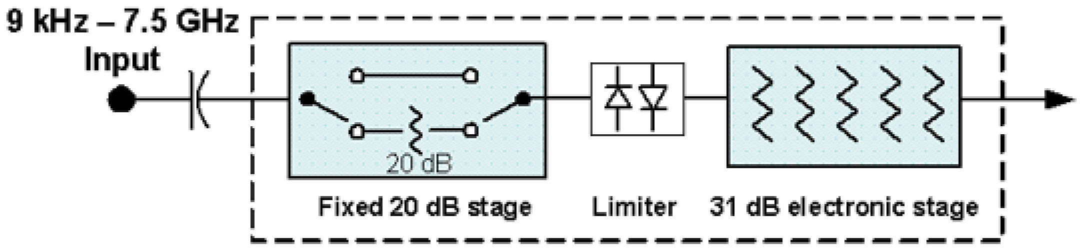


Configuration 2: Mechanical attenuator, no optional electronic attenuator

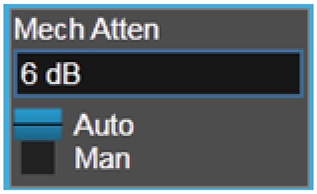


Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the "Dual-Attenuator" configuration.

Single-Attenuator Configuration

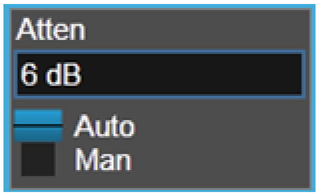


You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.



Mech Atten
6 dB
Auto
Man

Dual Attenuator



Atten
6 dB
Auto
Man

Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	`[:SENSe]:POWer[:RF]:FRATten <rel_ampl>` `[:SENSe]:POWer[:RF]:FRATten?`
Example	`:POW:FRAT 14`

	`:POW:FRAT?`
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See **Reference Level** and "Mech Atten" on page 2161 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	When the **Input** is **RF**, and the **Input Port** is **RF Input 2**, and the Full Range Attenuator is installed: On the Meas Bar, the field "Atten" displays as follows: – If the sweep is entirely < 50 GHz, the value shown after "Atten:" is equal to Mech Atten + Elec Atten + Full Range Atten – If the sweep is entirely > 50 GHz, the value shown after "Atten:" is equal to Full Range Atten – If the sweep straddles 50 GHz, the value shown after "Atten:" is preceded by the symbol ">=" and is equal to Full Range Atten In the **Amplitude**, "Y Scale" on page 2153 menu, and the Atten **Meas Bar** dropdown menu panel, a summary is displayed as follows: "Total Atten below 50 GHz" followed by the value of Full Range Atten + Mech Atten + Elec Atten "Total Atten above 50 GHz" followed by the value of Full Range Atten For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown: – Attenuator summary: – Total Atten below 50 GHz: 30 dB – Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models, and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to **Ref Level**, "Internal Preamp" on page 2183 Gain, any External Gain that is entered, and **Max Mixer Level** (if available), as described in the table below.

See "Attenuator Configurations and Auto/Man" on page 1179

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation <rel_ampl>` `[:SENSe]:POWer[:RF]:ATTenuation?`
Example	`:POW:ATT 20` Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of "main" attenuation) In either case, if the attenuator was in Auto, it is set to Manual
Dependencies	Some measurements do not support **Auto** setting of **Mech Atten**. In these measurements, the **Auto/Man** selection is not available, and the **Auto/Man** toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the **Auto/Man** toggle function is not available. The state of **Auto/Man** is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 2164 See "Attenuator Configurations and Auto/Man" on page 1179 for more information on the **Auto/Man** functionality
Couplings	If the RF Input Port is the RF Input: – If the USB Preamp is connected to USB, use 0 dB for **Mech Atten** – Otherwise compute the auto-selected value of **Mech Atten** based on **Reference Level**, **Int Preamp**, **External Gain**, **Ref Level Offset**, **Max Mixer Level**, **µW Path Control** and **IF Gain** settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) – In N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the value of "Full Range Atten" on page 2160 from the result to determine the **Mech Atten**. Limit the value so that it is never lower than 0 dB and so that total attenuation, including **Full Range Atten**, is never less than 6 dB (total attenuation, including **Full Range Atten** below 6 dB, can never be chosen by Auto) In External Mixing and BBIQ, where the attenuator is not in the signal path, the attenuator setting changes as described above when **Mech Atten** is in **Auto**, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input For CXA-m with Option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is <= 7.5 GHz. So, when the frequency is changed from below 7.5 GHz to above 7.5 GHz, the attenuation setting changes to a multiple of 10 dB that is no smaller than the previous setting. For example, 4 dB attenuation changes to 10 dB
Preset	**Auto** The Auto value is 10 dB
State Saved	Saved in instrument state
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased

Max	CXA Option 503 or 507	50 dB
	EXA	60 dB
	All other models	70 dB
	Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB	
Annotation	The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as: *Atten: <total> dB (e<elec>)* The e letter is in amber in Single-Attenuator configurations For example: Dual-Attenuator configuration: *Atten: 24 dB (e14)* Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB Single-Attenuator configuration: *A: 24 dB (e14)* Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation) When in Manual, a # sign appears in front of Atten in the annotation	

Auto Function

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:ATTenuation:AUTO?`
Example	Turn **Auto Mech Atten**ON: `:POW:ATT:AUTO ON`
Dependencies	`:POW:ATT:AUTO` is only available in measurements that support **Auto**, such as Swept SA
Preset	ON

Attenuator Configurations and Auto/Man

As described under "Attenuation" on page 2158, there are two distinct attenuator configurations available in the X-Series, the Single Attenuator and Dual-Attenuator configurations.

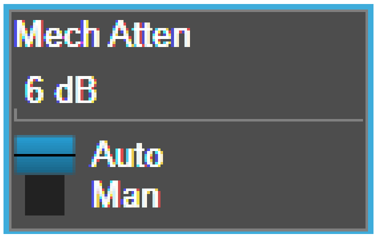
In Dual-Attenuator configurations, we have mechanical attenuation and electronic attenuation, and current total attenuation is the sum of electronic + mechanical attenuation.

In Single-Attenuator configurations, we refer to the attenuation set using "Mech Atten" on page 1177 (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then current total attenuation is the sum of main + soft attenuation.

See "Elec Atten" on page 2164 for more about "soft" attenuation.

NOTE

In some measurements, the **Mech Atten** control has an **Auto/Man** function. In these measurements, an **Auto/Man** switch is shown on the **Mech Atten** control:



Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no **Auto/Man** function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details of the Electronic Attenuator, see "More Information" on page 1182

Remote Command	`[:SENSe]:POWer[:RF]:EATTenuation <rel_ampl>` `[:SENSe]:POWer[:RF]:EATTenuation?`
Example	`:POW:EATT 10` `:POW:EATT?`
Notes	Electronic Attenuation's specification is defined only when **Mech Atten** is 6 dB

Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no “electronic attenuator”; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, `EATT` SCPI commands are accepted for compatibility with other X-series instruments, and set a “soft” attenuation. The “soft” attenuation is treated as an addition to the “main” attenuation value set by the **Attenuation** control or `:POW:ATT`, and affects the total attenuation displayed on the **Attenuation** control and the Meas Bar The electronic attenuator, and the “soft” attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out If "Internal Preamp" on page 2183 is `ON` (that is, set to Low Band or Full), the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned If both the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence If the electronic/soft Attenuator is enabled, then the **Stop Freq** of the instrument is limited to 3.6 GHz and **Internal Preamp** is unavailable If "LNA" on page 2185 is `ON`, the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out. This coupling works in the following modes/measurements: – Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes – Transmit On|Off Power measurement in 5GNR Mode – Power vs. Time and Transmit Power measurement in GSM/EDGE Mode – Burst Power measurement in Spectrum Analyzer Mode The SCPI-only “soft” electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement
Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in "Mechanical Attenuator Transition Rules" on page 1182
Preset	0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the **Mech Atten** control description

Auto Function

Remote Command	`[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:EATTenuation:STATe?`
Example	`:POW:EATT:STAT ON` `:POW:EATT:STAT?`
Preset	`OFF` (Disabled) for Swept SA measurement ON (Enabled) for all other measurements that support the electronic attenuator

NOTE

The maximum **Center Frequency** for Low Band can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values <= 40 MHz have a maximum Low Band frequency of 3.6 GHz, while 40 MHz < IFBW <= 1 GHz have a maximum of 3.3 GHz, and 1 GHz < IFBW <= 1.5 GHz have a maximum of 3.5 GHz. This frequency is reflected in the disabled message displayed for Electrical Attenuator. For N9032B and N9042B IFBW values > 1.5 GHz do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, the Electrical Attenuator will remain disabled no matter the Center Frequency.

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See "Using the Electronic Attenuator: Pros and Cons" on page 1183 for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the “soft” attenuation feature replaces the Dual-Attenuator configuration’s electronic attenuator. All the same couplings and limitations apply. See "Attenuator Configurations and Auto/Man" on page 2163

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode

- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled
- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "Pre-Adjust for Min Clipping" on page 2168.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Example	`:POW:RANG:OPT IMM`
Notes	Executing **Adjust Atten for Min Clipping** initiates the measurement
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate` is executed.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLy | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?`
Example	`:POW:RANG:OPT:TYPE EONL`

	`:POW:RANG:OPT:TYPE?`
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	`COMBined`
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is ON, it applies the adjustment described under "Adjust Atten for Min Clipping" on page 2167 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "Adjustment Algorithm" on page 1186

Selection	SCPI	Note
Off	`OFF`	This is the default setting
On	`ON`	Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the ON parameter is supported and mapped to `COMBined`
Elec Atten Only	`ELECtrical`	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Elec+Mech Atten	`COMBined`	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Example	`:POW:RANG:OPT:ATT OFF` `:POW:RANG:OPT:ATT?`
Notes	The parameter option `ELECtrical` sets this function to ON in Single-Attenuator models The parameter option `COMBined` is mapped to `ELECtrical` in Single-Attenuator models. If you send `COMBined`, it sets the function to ON and returns `ELEC` to a query For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to `COMBined`
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when "Elec Atten" on page 2164 is `OFF` or grayed-out, "Pre-Adjust for Min Clipping" on page 1185 is grayed-out

	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in BASIC and 5G NR Modes
Preset	`OFF` when Elec Atten is Disabled at preset, otherwise `ELEC`
State Saved	Saved in instrument state
Range	Dual-Attenuator models: Off | Elec Atten Only | Mech + Elec Atten Single-Attenuator models: Off | On

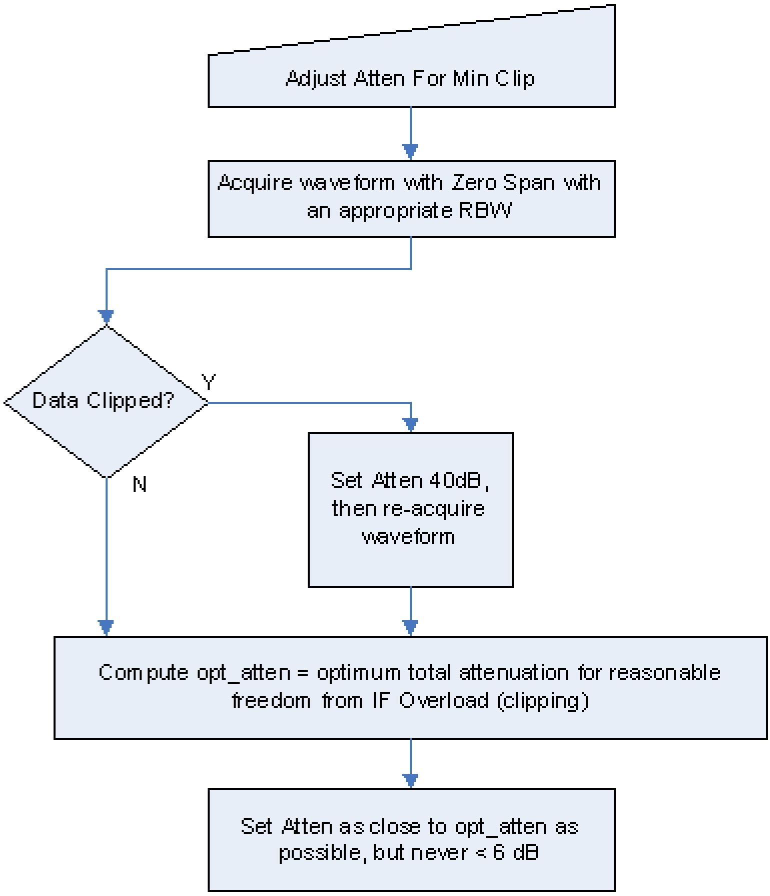
Backwards Compatibility Command

Notes	`ON` aliases to "Elec Atten Only" (`:POW:RANG:OPT:ATT ELEC`) `OFF` aliases to "Off" (`:POW:RANG:OPT:ATT OFF`) `:POW:RANG:AUTO?` returns true if `:POW:RANG:OPT:ATT` is not `OFF`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:RANGe:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:RANGe:AUTO?`

Adjustment Algorithm

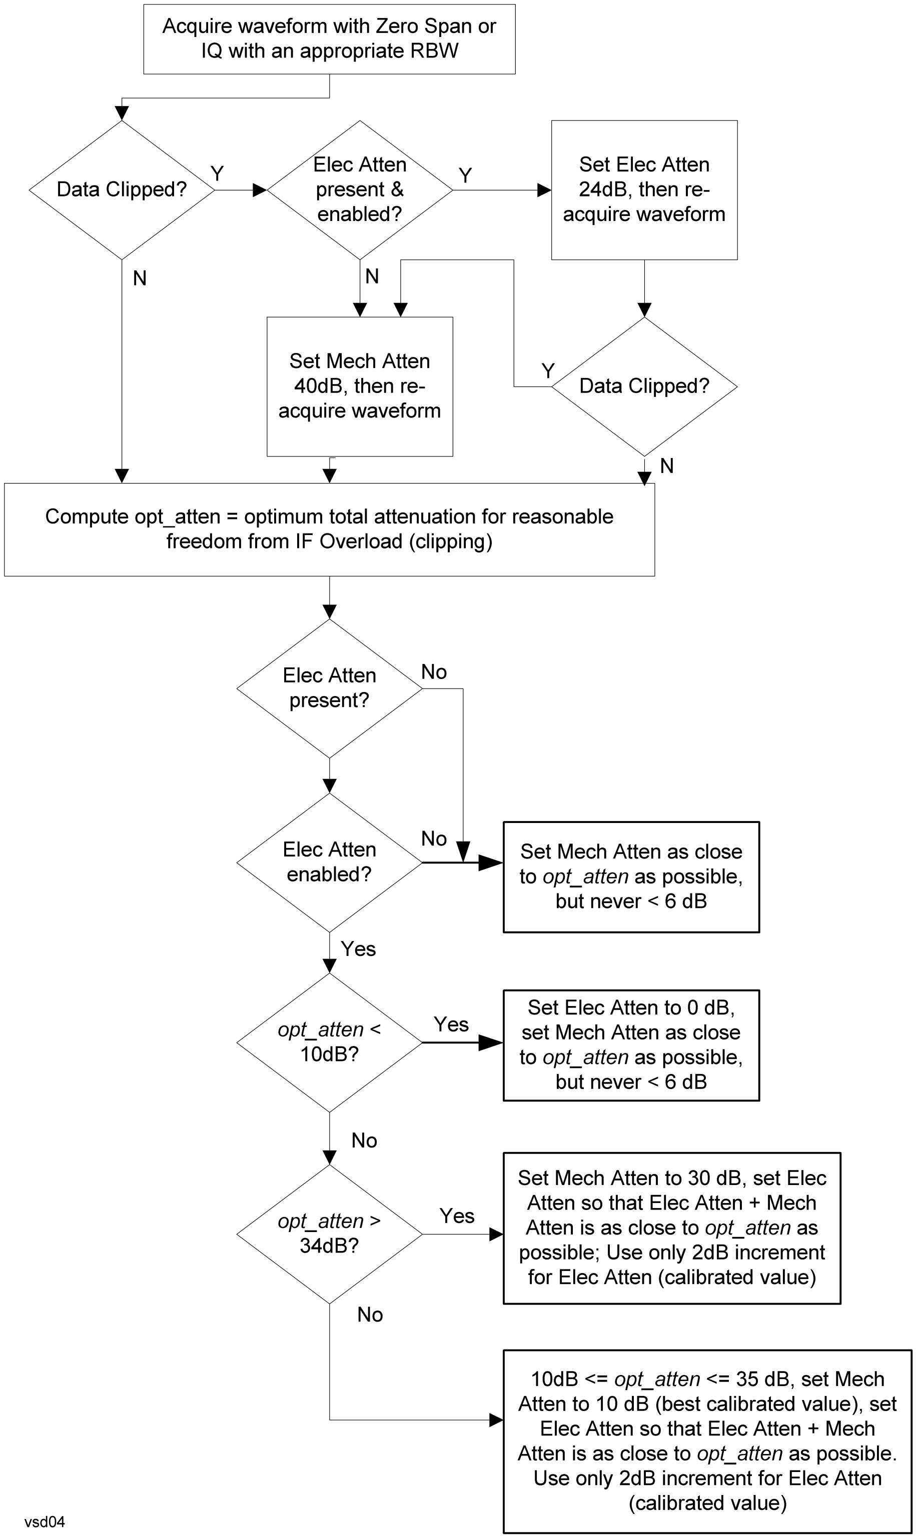
The algorithms for the adjustment are documented below:

Single-Attenuator Models



Dual-Attenuator models

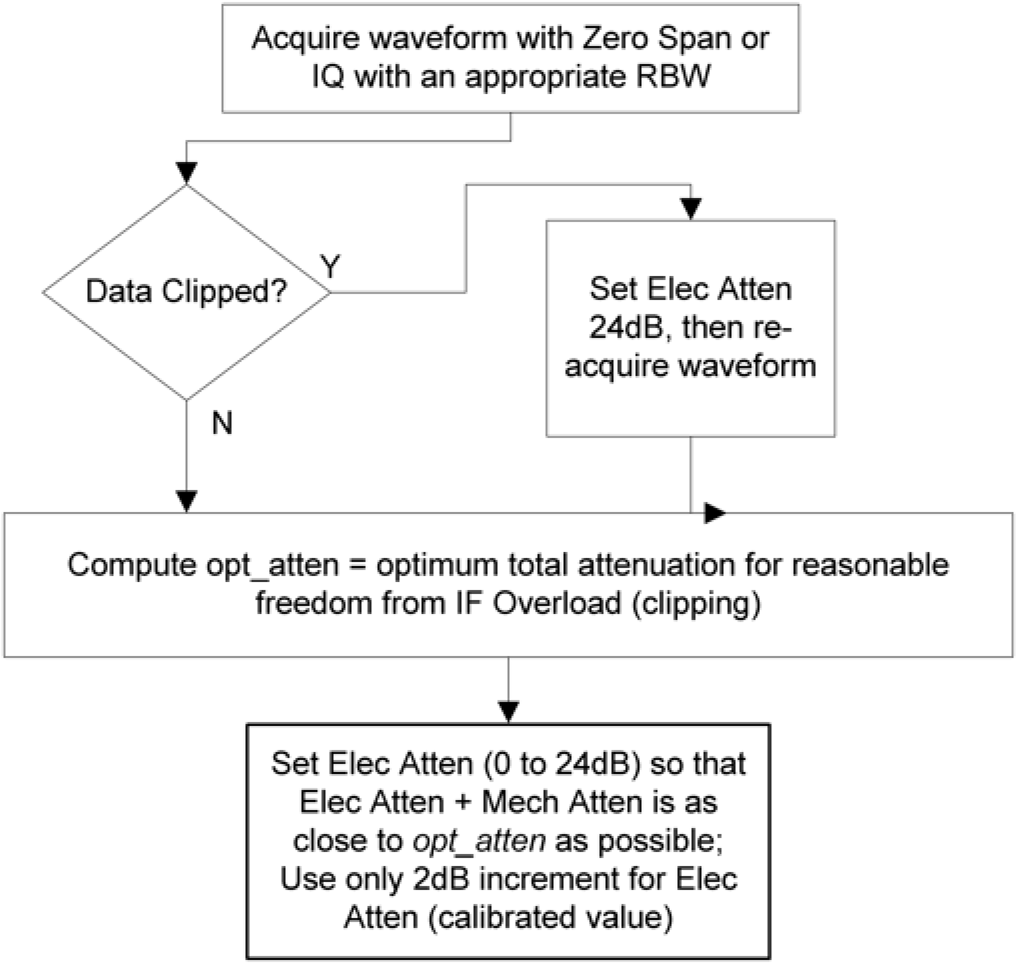
"Adjust Atten for Min Clipping" on page 2167 or "Pre-Adjust for Min Clipping" on page 1185 selection is Mech + Elec Atten:



Acquire waveform with Zero Span or IQ with an appropriate RBW
Data Clipped?
Y
N
Elec Atten present & enabled?
Y
N
Set Elec Atten 24dB, then re-acquire waveform
Set Mech Atten 40dB, then re-acquire waveform
Y
Data Clipped?
N
Compute opt_atten = optimum total attenuation for reasonable freedom from IF Overload (clipping)
Elec Atten present?
No
Elec Atten enabled?
No
Set Mech Atten as close to *opt_atten* as possible, but never < 6 dB
Yes
opt_atten < 10dB?
Yes
Set Elec Atten to 0 dB, set Mech Atten as close to *opt_atten* as possible, but never < 6 dB
No
opt_atten > 34dB?
Yes
Set Mech Atten to 30 dB, set Elec Atten so that Elec Atten + Mech Atten is as close to *opt_atten* as possible; Use only 2dB increment for Elec Atten (calibrated value)
No
10dB <= *opt_atten* <= 35 dB, set Mech Atten to 10 dB (best calibrated value), set Elec Atten so that Elec Atten + Mech Atten is as close to *opt_atten* as possible. Use only 2dB increment for Elec Atten (calibrated value)
vsd04

"Pre-Adjust for Min Clipping" on page 1185 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.



Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?`
Example	`:POW:ATT:STEP 2` `:POW:ATT:STEP?`
Notes	Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

3.7.3.3 Range (Non-attenuator models)

Only available for Keysight's modular signal analyzers and certain other Keysight products, such as VXT and M941xE.

State Saved	No

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe <real>` `[:SENSe]:POWer[:RF]:RANGe?`
Example	`:POW:RANG 10 dBm` `:POW:RANG?`
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the **Center Frequency** The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min/Max	–/+100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements

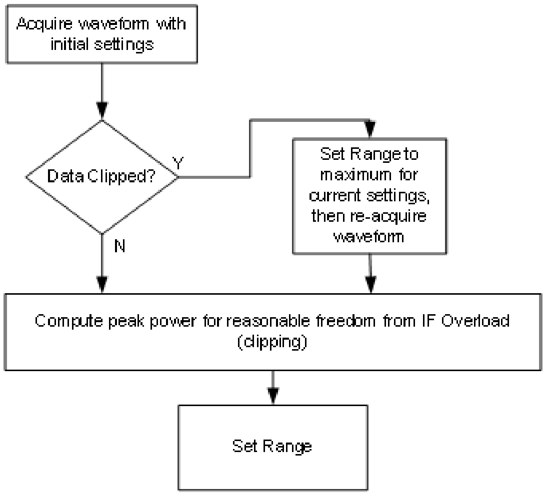
Pre-Adjust for Min Clipping

If this function is `ON`, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Notes	Because there is no attenuator control available in these models, the control displays only `ON` and `OFF` choices. However, for SCPI compatibility with other platforms, all three parameters (`ELECtrical`, `COMBined`, and `ON`) are honored and all are mapped to `ELECtrical`, so if any of these three parameters is sent, a subsequent query will return `ELEC`
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements
Preset	`OFF` for Swept SA measurement; `ON` for all other measurements that support **Pre-Adjust for Min Clipping**
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:



Peak-to-Average Ratio

Used with "Range (Non-attenuator models)" on page 2177 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:PARatio <real>` `[:SENSe]:POWer[:RF]:RANGe:PARatio?`
Example	`:POW:RANG:PAR 12 dB`
Notes	In some Modes, this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempts to change the value via SCPI are ignored, but no error message is generated
Dependencies	Does not appear in Spectrum Analyzer Mode
Preset	VXT Models M9410A/11A: 0 dB All Others: 10 dB
State Saved	Saved in instrument state
Min	0 dB
Max	VXT Models M9410A/11A: 50 dB All Others: 20 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "Peak-to-Average Ratio" on page 2179. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real>` `[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?`	
Example	`:POW:RANG:MIX:OFFS -5 dB`	
Preset	0 dB	
State Saved	Saved in instrument state	
Min	VXT Models M9410A/11A	-34 dB
	All Others	-35 dB
Max	30 dB	

3.7.3.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9420A, or UXM.

This tab *does* appear in VXT Models M9410A/11A/15A/16A and M9410E/11E/15E/16E, because "Software Preselection" on page 2195 is under this tab, and VXT Models M9410A/15A/16A and M9410E/11E/15E/16E implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range

between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "Preselector Adjust" on page 2182 changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in "Proper Preselector Operation" on page 1194.

Remote Command	`[:SENSe]:POWer[:RF]:PCENter`
Example	`:POW:PCEN`
Notes	The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command
Dependencies	Does not appear in CXA-m, nor in VXT Models M9410A/11A/15A/16A, M9410E/11E/15E/16E Grayed-out if the microwave preselector is off – If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken – Grayed-out if entirely in Band 0, that is, if **Stop Freq** is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if **Start Freq** is above 50 GHz – Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 – Grayed-out in the **Spectrogram** View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering appears in "Preselector Adjust" on page 2182
Status Bits/OPC dependencies	When centering the preselector, `*OPC` does not return true until the process is complete and a subsequent measurement has completed, nor are results returned in response to `:READ` or `:MEASure` queries The `Measuring` bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak

search to find

2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "Presel Center" on page 2181 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	`[:SENSe]:POWer[:RF]:PADJust <freq>` `[:SENSe]:POWer[:RF]:PADJust?`
Example	`:POW:PADJ 100KHz` `:POW:PADJ?`
Notes	The value on the control is displayed to 0.1 MHz resolution
Dependencies	– Does not appear in CXA-m – Does not appear in VXT Models M9410A/11A/15A/16A – Does not appear in M9410E/11E/15E/16E – Grayed-out if microwave preselector is off – Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz – Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the **Spectrogram** View
Preset	0 MHz

State Saved	The **Preselector Adjust** value set by "Presel Center" on page 2181, or by manually adjusting **Preselector Adjust** Not saved in instrument state, and does not survive a Preset or power cycle
Min/Max	–/+500 MHz
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PADJust` `[:SENSe]:POWer[:RF]:MMW:PADJust`

Backwards Compatibility Command

Notes	The command has no effect, and the query always returns `MWAVe`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVe | MMWave | EXTernal` `[:SENSe]:POWer[:RF]:PADJust:PRESelector?`

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec’d below 9 kHz".

Selection	Example	Note
Off	:POW:GAIN OFF	
Low Band	:POW:GAIN ON :POW:GAIN:BAND LOW	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	:POW:GAIN ON :POW:GAIN:BAND FULL	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE The maximum **Center Frequency** for **Low Band**, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values <= 40 MHz have a maximum **Low Band** frequency of 3.6 GHz, while 40 MHz < IFBW <= 1 GHz have a maximum of 3.3 GHz, and 1 GHz < IFBW <= 1.5 GHz have a maximum of 3.5 GHz. IFBW values > 1.5 GHz do not support a **Center Frequency** that can reach the **Low Band** maximum frequency. In these cases, **N/A** is displayed in the square brackets for **Low Band**.

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:BAND LOW | FULL` `[:SENSe]:POWer[:RF]:GAIN:BAND?`
Example	`:POW:GAIN:BAND LOW` `:POW:GAIN:BAND?`
Dependencies	Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A nor in M9410E/11E/15E/16E If `:POW:GAIN:BAND FULL` is sent when a low band preamp is available, the preamp band parameter is set to `LOW` instead of `FULL`, and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled
Preset	`LOW`
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says “Off” if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says “3.6 GHz”. If it is a 13.6 GHz preamp and it is set to Full Range the annotation says “13.6 GHz” When the USB Preamp is connected to USB, the Preamp annotation says “Preamp: USB” if the internal preamp is off or “Preamp: USB, Int” if the internal preamp is on (only for measurements that support the USB preamp)

Auto Function

Remote Command	`[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN[:STATe]?`
Example	`:POW:GAIN OFF` `:POW:GAIN?`
Preset	`OFF`

LNA

Lets you turn the Low Noise Amplifier (LNA) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to "Internal Preamp" on page 2183. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

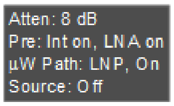
For best possible sensitivity, **LNA** can be turned on *together* with "Internal Preamp" on page 2183, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see "More Information" on page 1198

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?`
Example	`:POW:GAIN:LNA ON`
Dependencies	Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9420A/10A/11A M9410E/11E/15E/16E support LNA May not appear in some measurements **LNA** is not available when the electronic/soft attenuator is enabled
Preset	`OFF`
State Saved	Saved in State

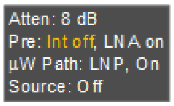
More Information

When **LNA** is installed, the preamp annotation changes to show the state of both **LNA** and **Internal Preamp**. Below is an example:



Atten: 8 dB
Pre: Int on, LNA on
µW Path: LNP, On
Source: Off

Note that when operating entirely in the low band (below about 3.6 GHz), if **LNA** is on, **Internal Preamp** is switched off (even if you have its switch set to ON). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:



Atten: 8 dB
Pre: Int off, LNA on
µW Path: LNP, On
Source: Off

µW Path Control

Options for this control include **µW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the µW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **µW Preselector Bypas**s, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the µW Preselector’s bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21-26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp’s compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **µW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. µW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See "Low Noise Path Enable" on page 1203
µW Preselector Bypass	:POW:MW:PATH MPB	See "µW Preselector Bypass" on page 1205
Full Bypass Enable	:POW:MW:PATH FULL	See "Full Bypass Enable" on page 1206

<table>
<tr><td>Remote Command</td><td><code>[:SENSe]:POWer[:RF]:MW:PATH STD | LNPath | MPBypass | FULL</code>
<code>[:SENSe]:POWer[:RF]:MW:PATH?</code></td></tr>
<tr><td>Example</td><td><code>:POW:MW:PATH LNP</code>
Enables the Low Noise path
<code>:POW:MW:PATH?</code></td></tr>
<tr><td>Notes</td><td>When "Presel Center" on page 2181 is performed, the instrument momentarily switches to the Standard Path, regardless of the setting of µW Path Control
The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean “when the low noise path is enabled” but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is Low Noise Path Enable or Full Bypass Enable. In the case where the DC Block is switched in, the instrument is now AC-coupled. However, if you selected DC coupling, the UI would still behave as though it were DC-coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC-coupled
Alignment switching ignores the settings in this menu, and restores them when finished</td></tr>
<tr><td>Dependencies</td><td>Does not appear in CXA-m, VXT Models M9410A/11A/15A/16A, nor in M9410E/11E/15E/16E, BBIQ and External Mixing
The Low Noise Path Enable selection does not appear unless Option LNP is present and licensed
The µW Preselector Bypass selection does not appear unless Option MPB is present and licensed
The Full Bypass Enable selection does not appear unless options LNP and MPB are both present as well as option FBP
In any of these cases, if the required options are not present and the SCPI command is sent, error -241, "Hardware missing; Option not installed" is generated
Low Noise Path Enable and Full Bypass Enable are grayed-out if the current measurement does not support them
Low Noise Path Enable and Full Bypass Enable are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, “Setting Conflict; Feature not supported for this measurement”</td></tr>

µW Path Control Auto

In VMA, WLAN, 5G NR, CQM Modes, an **Auto/Man** switch is added to **µW Path Control**:

This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

Measurement	µW Path Control Auto behavior
Digital Demod	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Custom OFDM	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Measurement	µW Path Control Auto behavior
ACP	Always Presel Bypass
SEM	Always Presel Bypass
Spurious Emissions	Always Standard Path

WLAN Mode

Measurement	µW Path Control Auto behavior
Modulation Analysis	Always Presel Bypass
Spectral Flatness	Always Presel Bypasss
Power vs Time	Always Presel Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Always Presel Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Always Presel Bypass
SEM	For 11be 320M, when 'Enabled Wideband IF for FFT' is OFF or 'Sweep Type Rule' is Best Dynamic Range, auto µW path is standard For other cases, auto µW path is presel bypass if presel bypass is enabled, auto µW path is standard if presel bypass is not enabled
Spurious Emissions	Always Standard Path

5G NR Mode

Measurement	µW Path Control Auto behavior
Modulation Analysis	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Channel Power	Always Standard Path
Occupied BW	Always Standard Path
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Standard Path
SEM	Always Standard Path
Spurious	Always Standard Path

Measurement	µW Path Control Auto behavior
Emissions	
Transmit On|Off Power	Use Standard Path unless tuned frequency > 3.6 GHz and Info BW > 15 MHz, in which case choose Preselector Bypass

Channel Quality Mode

Measurement	µW Path Control Auto behavior
Group Delay	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Remote Command	`[:SENSe]:POWer[:RF]:MW:PATH:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:MW:PATH:AUTO?`
Example	`:POW:MW:PATH:AUTO ON` `:POW:MW:PATH:AUTO?`
Dependencies	Only appears in VMA, WLAN, 5G NR and CQM Modes
Couplings	See "µW Path Control Auto" on page 1201 above
Preset	ON
Range	ON|OFF

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used,

whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

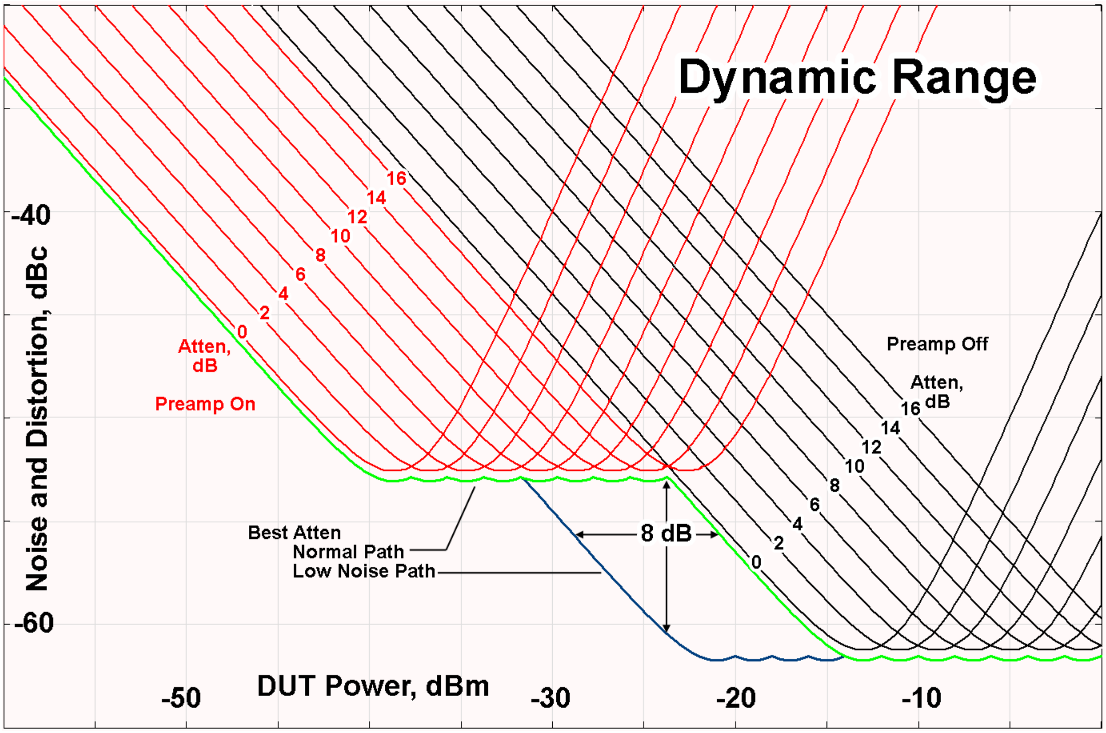
Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the "Low Noise Path." However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.



There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

µW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave presel is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION When **Full Bypass Enable** is selected, and "Y Scale" on page 2153 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently,

whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

Microwave Preselector Bypass Backwards Compatibility

Example	Bypass the microwave preselector: `:POW:MW:PRES OFF`
Notes	Included for Microwave Preselector Bypass backwards compatibility The `ON` parameter sets the `STD` path (`:POW:MW:PATH STD`) The `OFF` parameter sets path `MPB` (`:POW:MW:PATH MPB`)
Preset	`ON`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON | OFF | 0 | 1` `[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?`

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender's preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is `OFF`, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

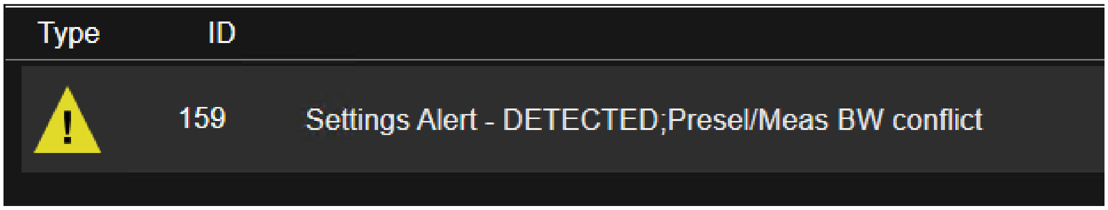
An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert;Presel/Meas BW conflict

Settings Alert message in the error queue

.



Type	ID	
⚠	159	Settings Alert - DETECTED;Presel/Meas BW conflict

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A/15A/16A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection ON at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:STATe 0 | 1 | ON | OFF` `[:SENSe]:POWer[:RF]:SWPresel:STAT?`
Example	`:POW:SWPR:STAT 1` `:POW:SWPR:STAT?`
Dependencies	Only appears in N9041B, N9042B+V2050A, VXT models M9410A/11A and M9410E/11E. Does not appear in all measurements
Couplings	Affects **Sweep Time** **Auto Tune** supports **Software Preselection**, so **Auto Tune** should be performed after setting the **Software Preselection** state
Preset	N9041B: OFF N9042B+V3050A: ON M9410A/11A: ON
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by 2 * IF / N. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- `NORMal` - mathematically removes all image and multiple responses of signals present at the input
- `ADVanced` - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel NORMal | ADVanced` `[:SENSe]:POWer[:RF]:SWPResel?`
Example	`:POW:SWPR NORM` `:POW:SWPR?`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 2195 is `OFF`. The grayout message is “Unavailable unless SW Presel enabled”
Preset	N9041B: `ADVanced` N9042B+V3050A: `NORMal`
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- `NORMal` – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for `NARRow` (below)
- `NARRow`– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from

wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:BW NORMal | NARRow` `[:SENSe]:POWer[:RF]:SWPResel:BW?`
Example	`:POW:SWPR:BW NARR`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 2195 is `OFF`. The grayout message is “Unavailable unless SW Presel enabled” For N9042B+V3050A, the parameter is SCPI-only, and always set to `NARRow` when **Software Preselection** is enabled
Preset	N9041B: `NORMal` N9042B+V3050A: `NARRow`
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A and M9410E/11E in bypass frequency range (1310MHz~5GHz), the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the “Prefilter” bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	`[:SENSe]:<measurement>:PFILter[:STATe] ON | OFF | 1 | 0` `[:SENSe]:<measurement>:PFILter[:STATe]?`

Example	Enable High Freq Prefilter for the Complex Spectrum Measurement in `BASIC` Mode:
	`:SPEC:PFIL ON`
	Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes:
	`:WAV:PFIL ON`
	Enable High Freq Prefilter for the Swept SA Measurement in `SA` Mode:
	`:SAN:PFIL ON`

Dependencies	Only appears in VXT models M9410A/11A with center frequency above 1310 MHz, and M9410E/11E in frequency range 1310MHz~5GHz
Preset	See "Prefilter Presets" on page 1212 below

State Saved	Saved in instrument state

Prefilter Presets

Meas	Mode	Preset
`SPEC`	`BASIC`	`OFF`
`WAV`	`BASIC, WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA`	`OFF`
`MON`	`WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA`	`OFF`
`RHO`	`WCDMA`	`OFF`
`CDP`	`WCDMA`	`OFF`
`PCON`	`WCDMA`	`OFF`
`EVMQ`	`WCDMA`	`OFF`
`CHP`	`WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA`	`OFF`
`OBW`	`WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA`	`OFF`
`ACP`	`WCDMA, LTEAFDD, LTEATDD, 5GNR, VMA, SA`	`OFF`
`SEM`	`WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA`	`OFF`
`PST`	`WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA`	`OFF`
`PVT`	`WLAN, LTEAFDD, LTEATDD, 5GNR`	`OFF`
`EVM`	`WLAN, LTEAFDD, LTEATDD, 5GNR`	`OFF`
`FLAT`	`WLAN`	`OFF`
`EVMM`	`WLAN`	`OFF`
`CEVM`	`LTEAFDD, LTEATDD`	`OFF`
`PAVT`	`5GNR, VMA`	`OFF`
`DDEM`	`VMA`	`OFF`
`OFDM`	`VMA`	`OFF`
`SAN`	`SA`	`ON`
`HARM`	`SA`	`ON`

3.7.4 BW

This key allows you to set the Bandwidth of the signal being measured.

Preset To Standard	Info BW	Notes
1.4 MHz (6 RB)	1.5 MHz	
3.0 MHz (15 RB)	3.0 MHz	
5.0 MHz (25 RB)	5.0 MHz	
10.0 MHz (50 RB)	10.0 MHz	Need B25 opt
15.0 MHz (75 RB)	25.0 MHz	Need B25 opt
20.0 MHz (100 RB)	25.0 MHz	Need B25 opt

Bandwidth	BS Info BW	UE Info BW	Notes
1.4 MHz (6 RB)	1.095 MHz	1.08 MHz	Need B40 or wider
3.0 MHz (15 RB)	2.715 MHz	2.7 MHz	Need B40 or wider
5.0 MHz (25 RB)	4.515 MHz	4.5 MHz	Need B40 or wider
10.0 MHz (50 RB)	9.015 MHz	9.0 MHz	Need B40 or wider
15.0 MHz (75 RB)	13.515 MHz	13.5 MHz	Need B40 or wider
20.0 MHz (100 RB)	18.015 MHz	18.0 MHz	Need B40 or wider

3.7.4.1 Settings

The Settings tab contains the basic Bandwidth functions. In most measurements it is the only tab under Bandwidth.

Info BW

Allows you to enter a frequency value to set the channel bandwidth that will be used for data acquisition.

Remote Command	`[:SENSe]:PVT:BANDwidth <freq>`
	`[:SENSe]:PVT:BANDwidth?`
	`[:SENSe]:PVTime:BANDwidth:AUTO ON | OFF | 1 | 0`
	`[:SENSe]:PVTime:BANDwidth:AUTO?`

Example	PVT:BAND 6.0 MHz ! Transmit On/Off Power
	PVT:BAND? ! Transmit On/Off Power
	`:PVT:BAND:AUTO OFF`
	`:PVT:BAND:AUTO?`

Dependencies	In the Transmit On/Off Power measurement, the Info BW control contains an Auto parameter. When it is set to AUTO, the bandwidth is automatically calculated according to the channel bandwith.
Couplings	This parameter is coupled with LTE/LTE-Advanced Preset to Standard parameters. When the state of info BW is Auto, the info BW value is automatically determined by the requirement of the standard. Otherwise, the info BW value depends on User’s input. When the info BW value is set manually, the state of info BW is automatically changes to Man.
Preset	Hardware Dependent Option B25: 5 MHz Option B40 and above: 4.515 MHz ON
State Saved	Saved in instrument state. Yes

Range	Auto|Man
Min **10 Hz /**	The analyzer’s max info bandwidth is option dependent: B1Y=160 MHz, B1X=140 MHz, B1A=125 MHz, B85= 85 MHz, B40=40 MHz, B25=25 MHz, else 10 MHz
Max	Analyzer Max Info BW The analyzer’s max info bandwidth is option dependent: B1Y=160 MHz, B1X=140 MHz, B1A=125 MHz, B85= 85 MHz, B40=40 MHz, B25=25 MHz, else 10 MHz
Resolution	1 Hz

3.7.5 Display

The Display key opens the Display Menu, which lets you configure display items for the current Mode, Measurement View or Window.

3.7.5.1 Meas Display

The Meas Display tab contains controls for setting up the display for the current Measurement, View or Window.

Trigger Line

Turns the Trigger Line On or Off.

Remote Command	`:DISPlay:PVTime:VIEW[1]:WINDow[1]:TRIGger[:STATe] ON | OFF | 1 | 0` `:DISPlay:PVTime:VIEW[1]:WINDow[1]:TRIGger[:STATe]?`
Example	`:DISP:PVT:VIEW:WIND:TRIG ON` `:DISP:PVT:VIEW:WIND:TRIG?`
Preset	OFF
State Saved	Yes
Range	On|Off

Burst Line

Turns the Burst Line On or Off. This line indicates where is the detected burst start and burst end.

Remote Command	`:DISPlay:PVTime:VIEW[1]:WINDow[1]:BLINes[:STATe] ON | OFF | 1 | 0` `:DISPlay:PVTime:VIEW[1]:WINDow[1]:BLINes[:STATe]?`
Example	`:DISP:PVT:VIEW:WIND:BLIN ON` `:DISP:PVT:VIEW:WIND:BLIN?`
Preset	OFF
State Saved	Yes
Range	On|Off

Burst Timing Indicator Line

Turns the Burst Timing Indicator Line On or Off. Note that this line is supported only in the RF Envelop window of the Burst view. The line shown on screen is just to indicate which part of signal is active burst and which part is inactive burst and nothing to do with the Pass/Fail (shown at the upper-left corner of screen) criteria. Regarding the Pass/Fail criteria, please refer to "Limit" on page 1256.

Remote Command	`:DISPlay:PVTime:VIEW[1]:WINDow[1]:LIMit:MASK OFF | ON | 0 | 1` `:DISPlay:PVTime:VIEW[1]:WINDow[1]:LIMit:MASK?`
Example	DISP:PVT:VIEW:WIND:LIM:MASK 1 DISP:PVT:VIEW:WIND:LIM:MASK?
Notes	This parameter only hides or shows the Burst Timing Indicator Line on the display.
Couplings	None
Preset	ON
State Saved	Yes
Range	On|Off

Ramp Lines

Turns the Ramp Line On or Off. This line indicates the start and the end of ramp up and ramp down.

Remote Command	`:DISPlay:PVTime:RAMP[:STATe] OFF | ON | 0 | 1` `:DISPlay:PVTime:RAMP[:STATe]?`
Example	`:DISP:PVT:RAMP ON` `:DISP:PVT:RAMP?`
Preset	OFF
State Saved	Yes
Range	On|Off

3.7.5.2 Views

The Transmit On/Off Power measurement has two views.

These Views are multiple-window Views. When in a multiple window View, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Whenever the View changes, the default menu is Frequency, unless otherwise specified in the View description.

View	String ID	Numeric ID	Window
Burst	ALL	1	RF Envelope Metrics
Rise & Fall	BOTH	2	Rise Fall Metrics

You can select the desired measurement view from the selections listed in the table below. There are two available commands, allowing you to select the view using either a string ID or a numeric ID value.

- :DISP:PVT:VIEW[:SEL] <string ID>
- :DISP:PVT:VIEW:NSEL <numeric ID>

View Selection by Name

Remote Command	`:DISPlay:PVTime:VIEW[:SELect] ALL | BOTH` `:DISPlay:PVTime:VIEW[:SELect]?`
Example	DISP:PVT:VIEW ALL DISP:PVT:VIEW?
Preset	ALL
State Saved	Saved in instrument state.
Range	Burst | Rise & Fall

View Selection by Number

Remote Command	`:DISPlay:PVTime:VIEW:NSELect <integer>` `:DISPlay:PVTime:VIEW:NSELect?`

Example	DISP:PVTime:VIEW:NSEL 2 DISP:PVTime:VIEW:NSEL?
Preset	1
State Saved	Saved in instrument state.
Min	1
Max	2

Burst

Windows:

- RF Envelope
- Metrics

View Burst envelope, the length of burst can be determined by slot number in mode setup.

Example	DISP:PVT:VIEW ALL

Rise&Fall

Windows:

- Rise
- Fall
- Metrics

Zooms in on the rising and falling portions of the burst being tested.

Example	DISP:PVT:VIEW BOTH

3.7.5.3 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	`:DISPlay:GRATicule[:STATe] OFF | ON | 0 | 1` `:DISPlay:GRATicule[:STATe]?`
Example	`:DISP:GRAT OFF`
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	`ON`
State Saved	Saved in instrument state

Backwards Compatibility SCPI	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF | ON | 0 | 1`
	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?`
	This command is accepted for backwards compatibility with older instruments, but the `WINDow`, `TRACe` and `GRID` parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When `OFF`, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	`:DISPlay:ANNotation:SCReen[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:SCReen[:STATe]?`
Example	`:DISP:ANN:SCR OFF`
Dependencies	Grayed-out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with ….

Remote Command	`:DISPlay:ANNotation:TRACe[:STATe] ON | OFF | 1 | 0` `:DISPlay:ANNotation:TRACe[:STATe]?`
Example	`:DISP:ANN:TRAC OFF`
Preset	`OFF`
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	`:DISPlay:ACTivefunc[:STATe] ON | OFF | 1 | 0` `:DISPlay:ACTivefunc[:STATe]?`
Example	`:DISP:ACT OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	`:DISPlay:ANNotation:MBAR[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:MBAR[:STATe]?`
Example	`:DISP:ANN:MBAR OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. Theare three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor :SYSTem:PRESet enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are using either the `:SYSTem:KLOCk` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is `OFF`, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

Name	Command
Select User View	`:DISPlay:VIEW:ADVanced:SELect`
Rename User View	`:DISPlay:VIEW:ADVanced:REName`
Delete User View	`:DISPlay:VIEW:ADVanced:DELete`
Create User View	`:DISPlay:VIEW:ADVanced:NAME`
Select Screen	`:INSTrument:SCReen:SELect`
Delete Screen	`:INSTrument:SCReen:DELete`
Delete All But This Screen	`:INSTrument:SCReen:DELete:ALL`
Add Screen	`:INSTrument:SCReen:CREate`
Rename Screen	`:INSTrument:SCReen:REName`
Sequencer On/Off	`:SYSTem:SEQuencer`

Remote Command	`:DISPlay:ENABle OFF | ON | 0 | 1` `:DISPlay:ENABle?`
Example	`:DISP:ENAB OFF`
Couplings	`:DISP:ENAB OFF` turns Backlight `OFF` and `:DISP:ENAB ON` turns Backlight `ON`, but changing Backlight settings does *not* change the state of `:DISP:ENAB`
Preset	`ON` Set by `:SYST:DEF MISC`, but not affected by `*RST` or `:SYSTem:PRESet`
State Saved	Not saved in instrument state
Backwards Compatibility Notes	`:SYST:PRES` no longer turns on `:DISPlay:ENABle` as it did in legacy analyzers

3.7.6 Freq

The Freq key opens the Frequency menu, which contains controls that allow you to control the Frequency and Channel parameters of the instrument.

Some features in the Frequency menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset. For example, the Center Freq setting is the same for all measurements - it does not change as you change measurements.

3.7.6.1 Settings

The Settings Tab contains controls that pertain to the X axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Carrier Reference Frequency

The parameter is set the reference frequency of all the carriers. The center frequencies of carriers are defined as offset frequency from this value.

If the following conditions are satisfied at the same time:

- the Number of Component Carrier equals to 1
- the Center Freq Offset equals to 0 Hz
- the mode of the Center Freq is Auto

the Center Freq is equivalent to Carrier Ref Freq.

When the Center Freq changes in such conditions, the mode of the Center Freq keeps as Auto and the Carrier Ref Freq will be changed to same value. The major purpose of this coupling is to keep BWCC with legacy LTE/LTE TDD, in which :SENSe:FREQuency:CENTer is used to set up the Frequency of the measurement.

Remote Command	`[:SENSe]:CCARrier:REFerence <freq>` `[:SENSe]:CCARrier:REFerence?`
Example	`CCAR:REF 2GHz` `CCAR:REF?`
Preset	1GHz
State Saved	Saved in instrument state
Min	Depends on instrument minimum center frequency. Same as Center Frequency
Max	Depends on instrument maximum center frequency. Same as Center Frequency
Resolution	1 Hz

3.7.7 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, **Marker** selects marker 1, sets it to Normal and places it at the center of the display. If the selected marker is Off, it is set to Normal and placed it at the center of the screen on the trace determined by the Marker Trace rules.

For more detailed information on the types of Markers and the interaction between Markers, see the Marker section of the Swept SA measurement.

3.7.7.1 Select Marker

Specifies the selected marker. The term “selected marker” is used throughout this document to specify which marker will be affected when you change marker settings, perform a Peak Search, etc.

The Select Marker control appears above the menu panel, indicating that it applies to all controls in the Marker menu panels. Select Marker is blanked if you select a tab whose controls do NOT depend on the selected marker (e.g., Counter).

On any menu tab for which Select Marker displays, the first control is always Marker Freqeuncy|Time.

Notes	The selected marker is remembered even when not in the Marker menu and is used if a Search is done or a Band Function is turned on or for Signal Track or Continuous Peak.
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state.
Annunciation	Appears in the marker results block label for **Normal** and **Delta** markers.

3.7.7.2 Settings

The controls on the Settings tab include the Marker active function and a radio button selection of the marker control mode (Normal, Delta, or Off) for the selected marker, as well as additional functions that help you use markers.

Marker Time

Set the X Axis value of the selected marker in the current X Axis Scale unit. If the marker mode is off, the SCPI command has no affect other than to cause the marker to become selected.

NOTE **The X label and value can change if the marker is moved to a trace with a different domain.**

If the marker mode is Normal, the Marker X position is absolute.

If the mode is Delta, then the X position is relative to the reference marker.

The valid X positions are the actual data points in the trace; the marker cannot be located between points. If a SCPI command attempts to place the marker between two points, the X value snaps to the closest point.

Note that for Vector or Constellation format, the X axis is perpendicular to the screen (because the screen axes are used to show the real and imaginary parts of the Y value), so adjusting the X value in this case only causes the marker to move horizontally if the real Y value changes.

Remote Command	`:CALCulate:PVTime:MARKer[1]|2|...|12:X <real>` `:CALCulate:PVTime:MARKer[1]|2|...|12:X?`
Example	CALC:PVTime:MARK:X 0.325 CALC:PVTime:MARK:X?
Notes	Marker X does not go outside the bounds of the data. If you attempt to set it to a value outside the bounds, it is clipped at the closest limit and error -222 Data Out of Range is generated. If suffix is sent, it must match the X units for the trace the marker is on. Otherwise, error -138, "Suffix not allowed" is generated. If you try to read or set the position of a Delta marker, remember that the position is in relative units.
Couplings	See "Coupling of Delta and Reference markers " on page 1225.
Preset	None until marker is turned on.
State Saved	Yes
Min	Depends on trace data
Max	Depends on trace data

SCPI only X position commands

Via SCPI, the marker position can also be set or queried in trace points. In this case, the position setting or reading is absolute regardless of control mode.

NOTE **The entered value in Trace Points is immediately translated into the current domain units for setting the value of the marker. The marker’s value in domain units, NOT trace points, is preserved if a change is made to the X Axis scale settings. Thus, if you use this command to place a marker on point 500, which happens at that time to correspond to 13 GHz, and then you change the Start Frequency so that point 500 is no longer 13 GHz, the marker stays at 13 GHz, NOT at point 500.**

If the trace the marker is on a 2-dimensional domain, then the points are numbered in the following way:

Starting at the minimum X and Z position, this point is numbered 0. Each time you increment the point number, increment the X value to the next available value. When X reaches the maximum X position, then reset X to the minimum and increment the Z value. Then continue incrementing the X position in the same manner as before.

Note that for symbol tables, which have no axes, incrementing the X position in points moves the marker consecutively through all table entries.

Remote Command	`:CALCulate:PVTime:MARKer[1]|2|...|12[:X]:POSition <real>` `:CALCulate:PVTime:MARKer[1]|2|...|12[:X]:POSition?`
Example	CALC:PVTime:MARK:POS 25 CALC:PVTime:MARK:POS?
Notes	When a marker mode is changed from off to any other mode, the X position is set to mid-screen.
Preset	None until marker is turned on.
State Saved	Yes
Min	Depends on trace data
Max	Depends on trace data

Remote Command	`:CALCulate:PVTime:MARKer[1]|2|...|12:X:UNIT?`
Example	CALC:PVTime:MARK:X:UNIT?
Notes	Query Only

Coupling of Delta and Reference markers

The following coupling rules apply from the front panel and also if the equivalent SCPI commands are sent.

Pressing the Delta key causes the selected marker to become a delta marker if it is not already. Also, the selected marker's reference is affected as follows:

- If the reference marker was off, it is turned on as a fixed??? marker.
- The reference marker is moved to the trace of the selected marker and set to the same position as the selected marker.
- If the delta marker has a marker function turned on, the reference marker takes on the same function (with the same band limits).

Exception: Pressing Delta when the selected marker's mode is not yet Delta does not move or change a reference marker that is already turned on (Normal, or Delta) and on the same trace as the selected marker. It merely changes the selected marker's mode to Delta and shows the current offset between it and the reference. If you press Delta again (when the selected marker is already in Delta mode) then the reference is moved and modified as described above.

When a delta marker is changed to any other control mode, if its reference marker is fixed then the reference marker is also turned off.

If you move a delta marker to a different trace, it is forced to Normal mode and if its reference is fixed, the reference is turned off.

A delta marker is forced to Normal mode if you turn its reference off or if you move its reference to another trace. (In the latter case the reference is not turned off even if it is fixed.)

If you change the selected marker's reference (using the Marker, Properties, Relative To), the selected marker is forced to Delta mode. This change of the selected marker to Delta mode causes its new reference's control mode and position to change as described above.

Marker Mode

Sets the marker control mode to **Normal**, **Delta**, or **Off**.

All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is Off, pressing Marker sets it to Normal and places it at the center of the screen on the trace determined by the **Marker Trace** rules.

The default active function is the active function for the currently selected marker control mode. If the current control mode is Off, there is no active function and the active function is turned off.

Remote Command	`:CALCulate:PVTime:MARKer[1]|2|...|12:MODE POSition	DELTa	OFF` `:CALCulate:PVTime:MARKer[1]|2|...|12:MODE?`
Example	CALC:PVTime:MARK3:MODE POS CALC:PVTime:MARK3:MODE?
Preset	OFF
State Saved	Saved in instrument state.
Range	Normal | DELTa (D) | Off

Backward Compatibility SCPI Commands

Sets or queries the state of a marker. Setting a marker which is OFF to state ON or 1 puts it in Normal mode and places it at the center of the screen.

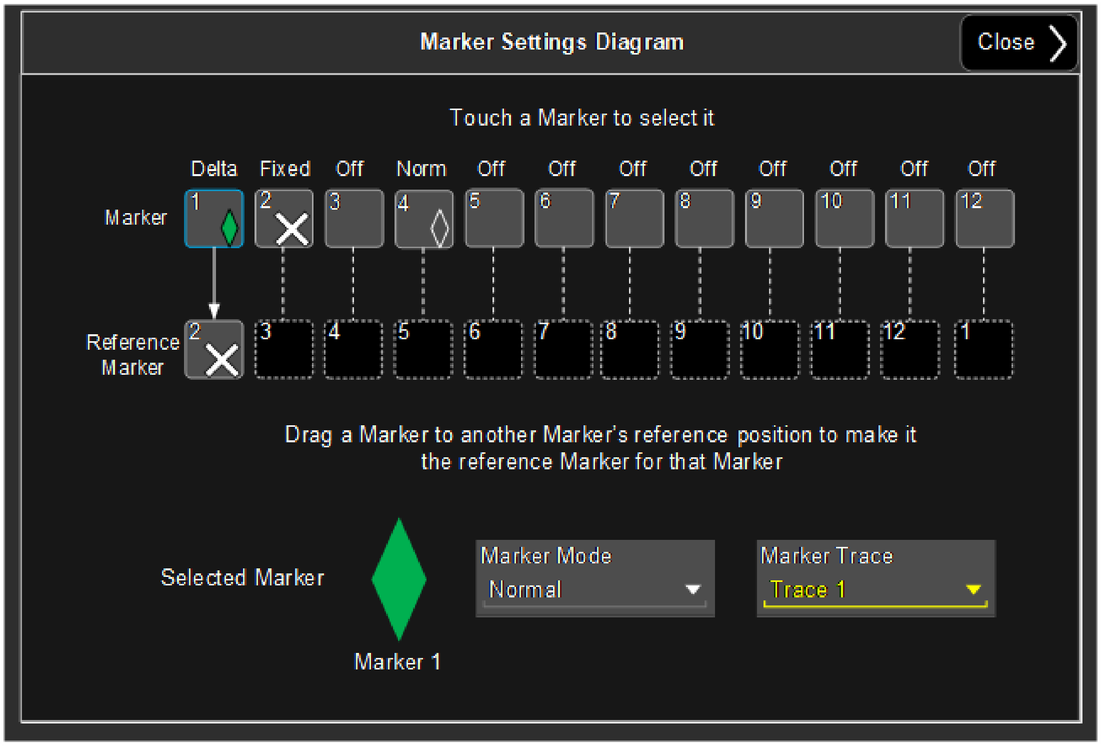
Remote Command	`:CALCulate:PVTime:MARKer[1]|2|...|12:STATe OFF	ON	0	1` `:CALCulate:PVTime:MARKer[1]|2|...|12:STATe?`
Example	CALC:PVTime:MARK3:STAT ON CALC:PVTime:MARK3:STAT?
Preset	OFF
State Saved	Saved in instrument state
Range	On|Off

Delta Marker (Reset Delta)

Pressing this button is exactly the same as pressing the “Delta” selection on the Marker Mode radio button. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

Marker Settings Diagram

The Marker Settings Diagram lets you configure the Marker system using a visual utility.



Touch a Marker to select it

Drag a Marker to another Marker's reference position to make it the reference Marker for that Marker

Marker Mode: Normal

Marker Trace: Trace 1

All Markers Off

Turns off all markers.

Remote Command	`:CALCulate:PVTime:MARKer:AOFF`
Example	CALC:PVTime:MARK:AOFF

Couple Markers

When this function is On, moving any marker causes an equal X Axis movement of every other marker which is not Off. “equal X Axis movement” means to preserve the difference between each marker’s X Axis value (in the fundamental x-axis units of the trace that marker is on) and the X Axis value of the marker being moved (in the same fundamental x-axis units).

Remote Command	`:CALCulate:PVTime:MARKer:COUPle[:STATe] ON | OFF | 1 | 0` `:CALCulate:PVTime:MARKer:COUPle[:STATe]?`
Example	CALC:PVTime:MARK:COUP ON CALC:PVTime:MARK:COUP?
Notes	In general, when coupling is turned on then all Normal or Delta markers with the same (or equivalent) domain as the selected marker move in the same manner as the selected marker. See "Peak Search" on

	page 1228
Preset	OFF (presets on Mode Preset and All Markers Off)
State Saved	Saved in instrument state

More Information

Coupling is relative between markers on the same trace (so that their relative positions in the domain are maintained). Coupling can be absolute between markers on different traces that have equivalent domains. That is, they have the same position in the domain, if possible. (As an example of equivalent domains, demodulated symbol positions can be derived from time by using the current symbol rate). When you move the selected marker, then others on related traces track it. This enables you to correlate different measurement results. For example, you can place a marker at a particular symbol time on an error vector magnitude display, have tracking markers on the symbol table and pre-demod time trace showing you the symbol value, and the actual time-varying signal value at the same point in time.

Absolute coupling is performed only for the lowest numbered Normal or Delta marker on each trace. All other markers on a trace couple relatively. When you turn on marker coupling, the subset of markers that have the same domain as the selected marker track it and all other markers remain at their current location. The absolutely coupled markers within this subset is moved at this time to match the domain setting of the selected marker, with the relatively coupled markers following accordingly to maintain offsets within their respective traces. Those markers with different domains remain at their current location. When you select a marker with a different domain than the previously selected marker, the subset of markers with that domain go through the same procedure.

Any marker that coupling would move outside its range of X values, remains at the closest limiting value. If the coupled markers are on data that do not have the same domain resolution, then they are positioned as close to each other as possible.

If markers change mode or trace, or trace data is changed below them, the coupling rules are immediately applied to the new set.

3.7.7.3 Peak Search

The controls on the Peak Search tab allow you to move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with the Delta Marker function.

NOTE **Pressing the Peak Search hardkey automatically moves you to the Peak Search page of the Marker menu AND performs a Peak Search.**

NOTE **Pressing the Peak Search tab once you are already IN the Marker menu does NOT perform a Peak Search.**

Marker Time

See "Marker Time" on page 1223.

Peak Search

Pressing the Peak Search control moves the selected marker to the trace point which has the maximum y-axis value for that marker's trace.

NOTE **Pressing the Peak Search hardkey automatically moves you to the Peak Search page of the Marker menu AND performs a Peak Search.**

Remote Command	`:CALCulate:PVTime:MARKer[1]|2|...|12:MAXimum`
Example	CALC:PVTime:MARK2:MAX The command SYST:ERR? can be used to query the errors to determine if a peak is found. The message "No peak found" will be returned after an unsuccessful search.

Marker Delta

Pressing this button is exactly the same as pressing the "Delta" selection on the Marker Mode radio button on the Settings tab. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

The control is duplicated here in the Peak Search Menu to allow you to conveniently perform a peak search and change the marker's control mode to Delta without having to access two separate menus.

3.7.7.4 Properties

The controls on the Properties tab are used to set certain properties of the selected marker.

Marker Time

See "Marker Time" on page 1223.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the “reference marker” for that marker. This attribute is set by the **Marker, Properties, Relative To** key. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	`:CALCulate:PVTime:MARKer[1]|2|...|12:REFerence <integer>` `:CALCulate:PVTime:MARKer[1]|2|...|12:REFerence?`
Example	CALC:PVTime:MARK:REF 5 CALC:PVTime:MARK:REF?
Notes	This command causes the marker specified with the subopcode to become selected. Range (for SCPI command): 1 to 12. If the range is exceeded the value is clipped. A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: “Settings conflict; marker cannot be relative to itself.” When queried a single value is returned (the specified marker numbers relative marker).
Couplings	The act of specifying the selected marker’s reference marker makes the selected marker a Delta marker. If the reference marker is off it is turned on in **Normal** mode at the delta marker location.
Preset	The preset default “Relative To” marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then it’s default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1. Set to the defaults by using **Restore Mode Defaults.** This is not reset by **Marker Off**, **All Markers Off**, or **Preset.**
State Saved	Saved in instrument state. Not affected by Marker Off and hence not affected by Preset or power cycle.
Min	1
Max	12
Resolution	1
Annunciation	Appears in the marker label of a **Delta** marker.

Marker Trace

Assigns the specified marker to the designated trace.

Remote Command	`:CALCulate:PVTime:MARKer[1]|2|...|12:TRACe RFENvelope | MAXHold | MINHold | RMS70` `:CALCulate:PVTime:MARKer[1]|2|...|12:TRACe?`
Example	CALC:PVTime:MARK:TRAC RFEN CALC:PVTime:MARK:TRAC?
Preset	RF Envelope
State Saved	Yes
Range	RF Envelope|Max Hold RF Envelope| Min Hold RF Envelope | 70us RMS trace

Marker Settings Diagram

The Marker Settings Diagram lets you configure the Marker system using a visual utility. This is the same as the"Marker Settings Diagram" on page 1226 control on the Settings tab.

3.7.8 Meas Setup

The Meas Setup menu panel contains functions for setting up the measurement parameters and also contains functions for setting up parameters global to all measurements in the mode.

Notes	None

3.7.8.1 Settings

The Settings tab contains frequently used Meas Setup functions to which you will want the fastest access.

Average/Hold Number

Sets the number of data acquisitions that are averaged. After the specified number of average counts is reached, the averaging mode (termination control) setting determines the averaging action.

Remote Command	`[:SENSe]:PVTime:AVERage:COUNt <integer>` `[:SENSe]:PVTime:AVERage:COUNt?`
Example	PVT:AVER:COUN 100 PVT:AVER:COUN?
Preset	10
State Saved	Yes

Min	1
Max	10000
Resolution	1

Averaging On/Off

Turns averaging on or off.

Remote Command	`[:SENSe]:PVTime:AVERage[:STATe] OFF | ON | 0 | 1` `[:SENSe]:PVTime:AVERage[:STATe]?`
Example	PVT:AVER OFF PVT:AVER?
Preset	ON
State Saved	Yes
Range	On|Off

Averaging Mode

Selects the type of termination control used for the averaging function. This determines the averaging action after the specified number of data acquisitions (average count) is reached. You can select between the **Exp** (exponential) and **Repeat** averaging modes. This selection only affects the averaging result after the number of N averages is reached. You can use the **Avg|Hold Number** to set N.

Control	SCPI	Description
Exponential averaging	EXPonential	When Measure is set at Cont, data acquisitions continue indefinitely. After N averages, exponential averaging is used with a weighting factor of N (the displayed average count stops at N). Exponential averaging weights new data more than old data, which allows tracking of slow-changing signals.
Repeat averaging	REPeat	When Measure is set at Cont, data acquisitions continue indefinitely. After N averages is reached, all previous result data is cleared and the average count is set back to 1. This is equivalent to being in Measure Single and pressing the Restart control when the Single measurement finishes.

Remote Command	`[:SENSe]:PVTime:AVERage:TCONtrol EXPonential | REPeat` `[:SENSe]:PVTime:AVERage:TCONtrol?`

Example	PVT:AVER:TCON EXP PVT:AVER:TCON?
Preset	REPeat
State Saved	Yes
Range	Exponential|Repeat

Average Type

Specifies the type of trace and result averaging to use.

CONTROL: Pwr Avg (RMS) SCPI: RMS|POWer	True power averaging that is equivalent to taking the RMS value of the voltage. It is the most accurate type of averaging
CONTROL: Log-Pwr Avg (Video) SCPI: LOG|LPOWer	Simulates the traditional spectrum analyzer type of averaging by averaging the log of the power

Remote Command	`[:SENSe]:PVTime:AVERage:TYPE LOG | LPOWer | RMS | POWer` `[:SENSe]:PVTime:AVERage:TYPE?`
Example	`:SENS:PVT:AVER:TYPE RMS` `:SENS:PVT:AVER:TYPE?`
Preset	`RMS`
State Saved	Yes
Range	Pwr Avg (RMS)|Log-Pwr Avg(Video)

Component Carrier

Selects the component carrier to be measured in the uplink time mask measurement.

Remote Command	`[:SENSe]:PVTime:ULINk:CCARrier CC0 | CC1 | CC2 | CC3 | CC4` `[:SENSe]:PVTime:ULINk:CCARrier?`
Example	PVT:ULINk:CCAR CC0 PVT:ULINk:CCAR?
Dependencies	The parameter is only visible when the direction is uplink. All the component carriers are listed. When invalid component carrier is selected, measurement error message will pop up at the status bar to indicate the component carrier setting is invalid.
Preset	CC0
State Saved	Saved in instrument state

Range	CC0|CC1|CC2|CC3|CC4

Ramp Time Length

This parameter indicates the searching window length in which the start of ramp up or the end of ramp down is searched. If it is set shorter than actual ramp time, the ramp may be lost. The start of the searching window is derived from the external trigger when auto timing adjust is off, and is at the actual burst boundary when auto timing adjust is on.

Remote Command	`[:SENSe]:PVTime:RAMP:SEARch:LENGth <time>` `[:SENSe]:PVTime:RAMP:SEARch:LENGth?`
Example	PVT:RAMP:SEAR:LENG 1.0 PVT:RAMP:SEAR:LENG?
Preset	17.0 us
State Saved	Yes
Min	1.0 us
Max	100.0 us
Resolution	100 ns

Auto Timing Adjustment

In order to check transmit off power is below the 3GPP defined limit, timing reference must be provided in the measurement. This setting specifies how the timing reference is derived in the measurement.

When it is ON, the burst boundary timing is always appropriately adjusted based on the measured ramp up and ramp down edge timings. When it is OFF, the timing reference will be provided by external trigger, expected burst boundaries will be derived from external trigger and frame configuration parameters – UL/DL allocation and special sub-frame configuration.

Remote Command	`[:SENSe]:PVTime:TIMing:REFerence:AUTO ON` `[:SENSe]:PVTime:TIMing:REFerence:AUTO?`
Example	PVT:TIM:REF:AUTO ON PVT:TIM:REF:AUTO?
Dependencies	When Auto Timing adjustment is OFF and Trigger type is free run, an advisory message is generated.
Preset	On
State Saved	Saved in instrument state
Range	On|Off

Off Power Meas Rules

The parameter is to indicate which way to calculate 70us RMS Off Power over the entire OFF period. When it is “Speed”, 70 us averaged power is calculated in 35us granularity during OFF period; when it is “Accuracy”, the 70us RMS Off Power is calculated for each sample points during OFF period

Remote Command	`[:SENSe]:PVTime:POFF:MEAS:RULes SPEed | ACCuracy` `[:SENSe]:PVTime:POFF:MEAS:RULes?`
Example	PVT:POFF:MEAS:RUL SPE PVT:POFF:MEAS:RUL?
Couplings	When the direction is uplink, the control is always greyed out. There is no 70us RMS off power for uplink signal.
Preset	Speed
State Saved	Saved in instrument state
Range	SPEed|ACCuracy

IF Gain

Accesses the menu that sets ranging in the digital IF when acquiring an I/Q time record.

See "More Information about IF Gain" on page 1235.

This function is not affected by RF Input Range attenuation.

More Information about IF Gain

To take full advantage of the RF dynamic range of the analyzer, you can manually turn on or turn off a switched digital IF amplifier. When it is turned on, the signal will get approximately 10 dB of gain.

- Setting IF Gain to Man and selecting High Gain will turn on the digital IF amplifier and get an extra 10 dB gain.
- Setting IF Gain to Auto will activate the Auto rules for IF Gain.

These settings affect sensitivity and IF overloads.

IF Gain Auto

Activates the Auto Rules for IF Gain. When Auto is active, the IF Gain is set to High Gain under any of the following conditions:

- the input attenuator is set to 0 dB
- the preamp is turned On
- the Max Mixer Level is –20 dBm or lower

For other settings, Auto sets IF Gain to Off.

Remote Command	`[:SENSe]:PVTime:IF:GAIN:AUTO[:STATe] ON | OFF | 1 | 0` `[:SENSe]:PVTime:IF:GAIN:AUTO[:STATe]?`
Example	PVT:IF:GAIN:AUTO ON PVT:IF:GAIN:AUTO?
Dependencies	This control does not appear in EXM, VXT, or UXM
Couplings	When either the auto attenuation is active (for example, with an electrical attenuator), or the optimize mechanical attenuator range is requested, the IF Gain setting is changed using the following rule The Auto selection sets IF Gain On under any of the following conditions: – the input attenuator is set to 0 dB – the preamp is turned on – the Max Mixer Level is –20 dBm or lower For other settings, Auto sets IF Gain to Off
Preset	OFF
State Saved	Yes
Range	Auto|Man

IF Gain State

Selects the range of IF gain.

- On sets the high gain option, which allows for better noise level measurements
- Off sets low gain when measuring large signals

When this parameter is changed manually from front panel, IF Gain Auto will become Man.

Remote Command	`[:SENSe]:PVTime:IF:GAIN[:STATe] ON | OFF | 1 | 0`

	`[:SENSe]:PVTime:IF:GAIN[:STATe]?`
Example	PVT:IF:GAIN ON PVT:IF:GAIN?
Notes	where ON = high gain OFF = low gain
Dependencies	This control does not appear in EXM, VXT, or UXM
Preset	OFF
State Saved	Yes
Range	Low Gain (Best for Large Signals)|High Gain (Best Noise Level)

Spur Avoidance

Because the VXT models M9410A/11A/15A are direct-conversion (zero-IF) receivers, feedthrough leakage from the local oscillator appears as a spurious signal (spur) at the center frequency. The Spur Avoidance function is provided to eliminate this spur, at the expense of some measurement speed.

When Spur Avoidance is enabled (the default), the analyzer uses a software algorithm to remove this spur from the displayed measurement data, but the algorithm only operates under certain conditions. Specifically, it only operates when the BW<= maxBW/2.5.

You can disable this function in order to speed up your measurement. When Spur Avoidance is turned Off, a warning message will appear in the status bar as “Settings Alert;Spur Avoidance Off”. This is to alert you that measurement accuracy might be impacted because you have defeated the spur avoidance algorithm.

Remote Command	`[:SENSe]:PVTime:SAVoid[:STATe] ON|OFF|0|1` `[:SENSe]:PVTime:SAVoid[:STATe]?`
Example	`:PVT:SAV ON` `:PVT:SAV?`
Dependencies	This control only appears in VXT models M9410A/11A/15A.
Preset	ON
State Saved	Saved in instrument state
Range	On|Off

Meas Setup Summary Table

The Meas Setup Summary Table lets you view and access many of the parameters in the Meas Setup menus on one screen.

Meas Preset

Restores all the measurement parameters to their default values.

Remote Command	`:CONFigure:PVTime`
Example	CONF:PVT
Couplings	Selecting Meas Preset restores all measurement parameters to these default values

Ignore Burst Found (SCPI only)

In the Pvt measurement, by default, it checks whether a burst signal is found and decides what to do next. When average state is ON and no burst signal is found, the measurement will continuously run and you cannot get test results by SCPI meas/read/fetch command under continuous measurement status. To avoid this, it is recommended to implement timeout process in test scripts.

This SCPI only parameter is defined to stop continuous running, as an alternate option. For backwards compatibility, the behavior of “waiting for burst found” is kept intact when this parameter is OFF..

Remote Command	`[:SENSe]:PVTime:IGNore:BURSt:FOUNd OFF | ON | 0 | 1` `[:SENSe]:PVTime:IGNore:BURSt:FOUNd?`
Example	PVT:IGN:BURS:FOUN ON PVT:IGN:BURS:FOUN?
Preset	OFF
State Saved	Yes

3.7.8.2 Radio

Contains controls to select link direction.

Direction

Specifies whether the LTE-Advanced signal is an uplink signal or a downlink signal.

The choice of link direction determines the Sync/Format, Chan Profile and Time. Advanced menus all change based on the link direction selected. Also, since downlink and uplink signals use OFDMA and SC-FDMA respectively, the list of trace results available and the default traces presented change based on the link direction parameter.

Remote Command	`[:SENSe]:RADio:STANdard:DIRection DLINk | ULINk` `[:SENSe]:RADio:STANdard:DIRection?`
Example	`:RAD:STAN:DIR DLIN`
Couplings	TDD: Changing direction affects the sync source of periodic trigger source or gate source If Direction is uplink, the sync source is RF burst If Direction is downlink, the sync source is External1 If direction is downlink, the menu Measure PRACH/SRS is disabled and the value is off FDD/TDD: Changing Direction affects many other modulation analysis setup parameters
Preset	DLIN ULIN on E6640A DLIN on E6650A
State Saved	Yes
Range	Downlink|Uplink For E6640A, Direction is restricted to Uplink only, Downlink is not selectable For E6650A, Direction is restricted to Downlink only, Uplink is not selectable

3.7.8.3 Component Carriers

Contains settings that let you configure the analyzer to match the component carriers in your LTE-A signal.

Number of Component Carriers

Specifies how many component carriers are included in LTE-Advanced TDD/FDD measurements. Each component carrier complies with the LTE specifications.

LTE-Advanced TDD/FDD supports a maximum of five component carriers, so the maximum transmission bandwidth is up to 100 MHz.

Remote Command	`[:SENSe]:CCARrier:COUNt <integer>` `[:SENSe]:CCARrier:COUNt?`
Example	`:CCAR:COUN 1` `:CCAR:COUN?`
Notes	The max number of Component carriers can be set greater than one with 9080B/9082B-2FP license
Preset	1
State Saved	Yes
Min	1
Max	5

Carrier Allocation

Specifies the carrier frequency allocation. There are two types of allocation, contiguous and non-contiguous. Non-Contiguous frequency allocation is defined as an allocation where two sub-blocks are separated with a sub-block gap:

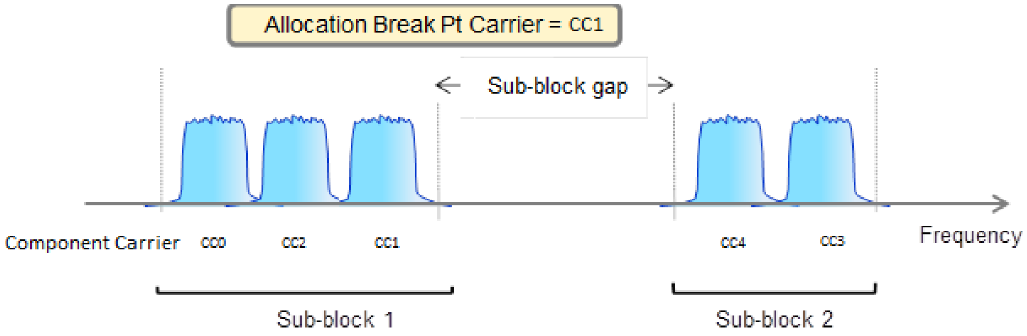
- CONTiguous – All the component carriers belong to one block and no sub-block gap exists
- NCONtiguous – Component carriers are separated into two sub-blocks. Allocation Break Pt Carrier determines how sub-blocks are configured

Remote Command	`[:SENSe]:CCARrier:CONFig:ALLocation CONTiguous | NCONtiguous` `[:SENSe]:CCARrier:CONFig:ALLocation?`
Example	`:CCAR:CONF:ALL CONT` `:CCAR:CONF:ALL?`
Preset	CONTiguous
State Saved	Saved in instrument state
Range	Contiguous|Non-Contiguous

Non-Contiguous Break at

Specifies an allocation break point in non-contiguous carrier allocation. First sub-block starts from the lowest frequency carrier and stops at the allocation break point carrier. Next sub-block starts from the next upper frequency carrier and ends at the highest frequency carrier.

one example is shown below. In the example carrier indices are not in the order of carrier frequency. In the example, Allocation Break Pt Carrier is CC1. It means that sub-block 1 ends at carrier CC1 and sub-block 2 starts at carrier CC4. Sub-block gap is located between carrier CC1 and CC4.



Remote Command	`[:SENSe]:CCARrier:CONFig:ALLocation:NCONtiguous:ABPoint CC0 | … | CC4`

	`[:SENSe]:CCARrier:CONFig:ALLocation:NCONtiguous:ABPoint?`
Example	`:CCAR:CONF:ALL:NCON:ABP CC0` `:CCAR:CONF:ALL:NCON:ABP?`
Notes	The options CC1~CC4 can be enabled with 9080B/9082B-2FP license
Dependencies	Allocation Break Point is coupled to Number of Component Carriers. For example, Allocation Break Point list will include CC0~CC1 if the number of Component Carriers is 2
Preset	CC0
State Saved	Saved in instrument state
Range	CC0|CC1|CC2|CC3|CC4

Configure Comp Carriers

Lets you perform a detailed configuration of your component carriers, including number of carriers, presets, bandwidth, offset, integration bandwidth, etc.

Configure CCs

Lets you configure System Bandwidth, frequency offsets, and integration bandwidth, and also lets you exclude certain carriers from the measurement.

Number of Component Carriers

See "Number of Component Carriers" on page 2245.

Carrier Allocation

See "Carrier Allocation" on page 2245.

Non-Contiguous Break at

See "Non-Contiguous Break at" on page 2246.

System BW

Enables you to set the system bandwidth of each component carrier for LTE-Advanced / NB-IoT signal (which also determines the total number of resource blocks for Modulation Analysis measurement).

Remote Command	`[:SENSe]:CCARrier0|…|4:RADio:STANdard:BANDwidth B1M4 | B3M | B5M | B10M | B15M | B20M | B200K`

	`[:SENSe]:CCARrier0|…|4:RADio:STANdard:BANDwidth?`
Example	`:CCAR4:RAD:STAN:BAND B5M`
Preset	B5M
State Saved	Yes
Range	1.4 MHz (6 RB) | 3 MHz (15 RB) | 5 MHz (25 RB) | 10 MHz (50 RB) | 15 MHz (75 RB) | 20 MHz (100 RB) | 200kHz (NB-IoT)
Backwards Compatibility SCPI	`[:SENSe]:RADio:STANdard:BANDwidth`

Measure Carrier

Sets whether to measure this component carrier or not.

Remote Command	`[:SENSe]:CCARrier0|…|4[:STATe] OFF | ON | 0 | 1` `[:SENSe]:CCARrier0|…|4[:STATe]?`
Example	`:CCAR0 ON` `:CCAR0?`
Notes	The command is used with a sub-op code <n> (default=0) to specify the component carrier for configuration. The range of the sub-op code is determined by the number of component carriers
Preset	ON
State Saved	Saved in instrument state
Range	On|Off

Frequency Offset

Sets the component carrier center frequency as offset from the Carrier Ref Frequency.

Remote Command	`[:SENSe]:CCARrier<n>:FREQuency:OFFSet <freq>` `[:SENSe]:CCARrier<n>:FREQuency:OFFSet?`
Example	`:CCAR4:FREQ:OFFS 10MHz` `:CCAR4:FREQ:OFFS?`
Notes	Used with a sub-op code <n> (default=0) to specify the component carrier for configuration. The range of the sub-op code is determined by the number of component carriers
Preset	0Hz
State Saved	Saved in instrument state
Min	-3.5GHz
Max	3.5GHz

Spectrum

Determines if the spectrum of the incoming data is mirrored or not. The actual mirroring is accomplished by conjugating the complex time data.

Note that only the Modulation Analysis measurement and Conformance EVM measurement support this feature.

Remote Command	`[:SENSe]:CCARrier0|…|4:SPECtrum NORMal | INVert` `[:SENSe]:CCARrier0|…|4:SPECtrum?`
Example	`:CCAR0:SPEC INV` `:CCAR0:SPEC?`
Preset	NORM
State Saved	Yes
Range	Normal | Invert
Backwards Compatibility SCPI	`[:SENSe]:SPECtrum`

UL/DL Configuration

Allows you to set the Uplink and Downlink allocation configuration of the signal being measured. The choice of link direction will determine which slot in the frame is used for uplink transmission, and which slot for downlink transmission.

Remote Command	`[:SENSe]:CCARrier0|…|4:RADio:STANdard:ULDL CONF0 | … | CONF6` `[:SENSe]:CCARrier0|…|4:RADio:STANdard:ULDL?`
Example	`:CCAR0:RAD:STAN:ULDL CONF0`
Notes	CONF0: Configuration 0 (DSUUUDSUUU) CONF1: Configuration 1 (DSUUDDSUUD) CONF2: Configuration 2 (DSUDDDSUDD) CONF3: Configuration 3 (DSUUUDDDDD) CONF4: Configuration 4 (DSUUDDDDDD) CONF5: Configuration 5 (DSUDDDDDDD) CONF6: Configuration 6 (DSUUUDSUUD)
Preset	CONF0
State Saved	Yes
Range	Configuration 0|Configuration 1|Configuration 2|Configuration 3|Configuration 4|Configuration 5|Configuration 6
Backwards Compatibility SCPI	`[:SENSe]:RADio:STANdard:ULDL`

Dw/GP/Up Len

This control allows you to set the DwPTS/GP/UpPTS length configuration of the signal being measured. The choice of link direction will determine the length of DwPTS, GP and UpPTS in the Special Subframe.

Remote Command	`[:SENSe]:CCARrier0|…|4:RADio:STANdard:DGPU CONF0 | … | CONF9` `[:SENSe]:CCARrier0|…|4:RADio:STANdard:DGPU?`
Example	`:CCAR0:RAD:STAN:DGPU CONF0`
Notes	CONF0: Configuration 0 CONF1: Configuration 1 CONF2: Configuration 2 CONF3: Configuration 3 CONF4: Configuration 4 CONF5: Configuration 5 CONF6: Configuration 6 CONF7: Configuration 7 CONF8: Configuration 8 CONF9: Configuration 9
Dependencies	The special sub-frame configuration 9 is only enabled when it is LTE-Advanced TDD
